# About the Editor

---

Timothy R. Levine, Ph.D., is professor of communication and media at Korea University, South Korea, where he teaches and conducts research on topics related to interpersonal communication, persuasion, social influence, and social-scientific research methods. In addition to teaching graduate and undergraduate classes, Levine conducts training for police, attorneys, and people in the intelligence and counterintelligence communities. Before Korea University, he held faculty appointments at Michigan State University, Indiana University, and the University of Hawai'i. He has published more than 100 refereed journal

articles reporting original research related to communication.

Levine is an internationally recognized leader in deception research. He is the author or coauthor of *Information Manipulation Theory*, *Truth Default Theory*, *The Veracity Effect*, *The Probing Effect*, and *The Park-Levine Probability Model*. His research on deception has been funded by the National Science Foundation, the U.S. Department of Defense, and the Federal Bureau of Investigation. His current research focuses on what makes some people more believable than others and on effective interrogation strategies.

# Introduction

---

Few topics capture people's curiosity and interest as much as deception. Deception is the stuff of soap operas, spy thrillers, multimillion-dollar frauds, and poker championships. There are the deadly serious deceptions during wartime, as well as harmless pranks such as the jackalope and April Fool's Day. (If you have not seen a jackalope, it is a jackrabbit with antelope horns.) The famous deceptions throughout history are too numerous to mention. Examples include the biblical serpent in the Garden of Eden and the scientific hoax of Piltdown Man.

Deception is not an exclusively human activity; examples of deception are also common in biology. Primates are capable of quite sophisticated deception. However, humans do not develop the cognitive capacity to fully engage in true deception until somewhere between the ages of 3 and 5.

Deception is most often defined as intentionally or knowingly misleading another individual or group, although sometimes self-deception is included as well. Deception comes in many shades and flavors such as outright lies, white lies, omission, evasion, equivocation, puffery, half truths, and so forth. People lie for all kinds of reasons. All of these variations are covered in the two volumes of this encyclopedia, which survey the wide variety of lies and deceptions in their many manifestations. Deception is examined from the vantage points of social science, history, philosophy,

and pop culture, to name a few. The *Encyclopedia of Deception* is the authoritative source on the topic.

## Popular Draw of Deception

Perhaps the best recent example of how deception captures public interest was the initial popularity of the crime drama television series *Lie to Me* on Fox Network. The main character, Dr. Cal Lightman (played by Tim Roth), is a psychologist with expertise in reading body language and facial expressions, especially brief expressions called microexpressions. Lightman and his team solve crimes through detecting lies and reading human behavior. With approximately 11 million viewers in the first season, the show initially had strong ratings and was renewed for three seasons. Besides the United States, the show was aired in Canada, Australia, South Africa, Latin America, and several countries in Europe.

The premise of *Lie to Me* is based on the ideas of real-life psychologist Paul Ekman. However, Ekman's ideas are controversial, and the show may not depict science as much as suggested by its marketing. As a skeptic, I did a little experiment that was published in the academic, peer-reviewed journal *Communication Research*. We showed research participants either an episode of *Lie to Me* or a different crime drama, *Numb3rs*. A third group viewed no show at all. Then, we had our

participants try a deception detection task. Watching *Lie to Me* did not make people any better at distinguishing truths and lies, but it did make subjects more cynical than either of the two control conditions. *Lie to Me* was more about entertaining fiction than solid science, but it exemplifies the draw of the topic.

### **Deception Detection and Deception Research**

Deception detection is also big business. Web sites such as [www.liespotting.com](http://www.liespotting.com) promise “proven techniques to detect deception.” Paul Ekman’s [EkmanInternational.com](http://EkmanInternational.com) offers “cutting edge behavioral science for real-world applications.” There are also [EyesforLies.com](http://EyesforLies.com) and [Humintell.com](http://Humintell.com). John E. Reid and Associates train thousands of people, especially law enforcement professionals, each year in the Reid Technique. The *Encyclopedia of Deception* covers the gamut of deception detection methods, from the scientifically discredited to the most promising.

In the realm of deception, things are often not what is expected or what they seem. It is a very common belief, for example, that liars will not look one in the eye while lying. However, one might be surprised just how widespread that belief is. Research by psychologist Charley Bond has found that the gaze aversion belief is widespread around in the world. He and his team surveyed people in more than 70 different countries and found that the liars-won’t-look-you-in-the-eye belief was nearly universal. But much experiential works reveal that belief to be objectively false. Gaze is unrelated to actual honesty. It has zero validity as a lie-detection clue.

There has been much research on nonverbal cues to deception dating back to the original work of Ekman and his idea of leakage. It is well documented that people use others’ nonverbal behaviors as a way to detect lies. My research and that of many others has strongly supported people’s reliance on observations of others’ nonverbal behaviors when assessing honesty. Many psychological theories also specify a link between lying and nonverbal behaviors, as portrayed on *Lie to Me*. However, social scientific research on the link between various nonverbal behaviors and the act of lying suggests that the link is typically not very strong or consistent. In my research, I have observed that the

nonverbal signals that seem to give one liar away are different than those given by a second liar. Further, people do not give away their lies the same way every time, and there are often honest people enacting those supposed lie-revealing behaviors. What’s more, the scientific evidence linking nonverbal behaviors and deception has grown weaker over time. People infer honesty based on how others nonverbally present themselves, but that has very limited utility and validity.

Research on lie detection suggests that without the aid of technology such as the polygraph, people are often poor lie detectors. In most deception detection experiments, people typically do statistically better than chance, but usually not by much. However, very recent research suggests promising new approaches, such as the strategic use of evidence and content in context. Strategic use of evidence involves withholding what one knows to see if the person contradicts that knowledge. Even with the aid of technology such as the polygraph, lie detection is not perfect. Research is progressing on other technologies such as fMRI and thermal imaging, but the polygraph in conjunction with a skilled examiner may be the best approach for now. All of these methods and many more are covered in the *Encyclopedia of Deception*.

Deception is not limited to humans; in fact, deception in nature is commonplace and varied. Perhaps you and your dog have engaged in “fake out” while playing fetch. Examples of deception in nature include camouflage and mimicry. Primatologists have also observed gorillas engaged in deception. For example, a band of gorillas is seen walking along a jungle path in single file. One gorilla, which spies a desired food in a nearby tree, stops by the side of the trail and grooms until the others are out of sight. Then, the gorilla grabs the food, quickly eats it, and hurries to join the band.

### **Historical Deceptions**

There are many famous lies and deceptions throughout history. There was P. T. Barnum, Niccolò Machiavelli, Sun Tzu, Operation Mincemeat, and the Trojan horse. As long as people have communicated, there have been honesty and deception. As long as history has been recorded, there has been a record of deception in human affairs.

Biblical examples of deception are numerous. Besides the serpent lying to Eve about the

forbidden fruit, Abraham's wife told the Egyptians that she was Abraham's sister. Jacob was deceived by his sons about the death of his favorite son, Joseph. The entry on deception in ancient civilizations describes at least eight stories of lies that are told in the book of Genesis alone.

World War II is another source of well-known deceit. Nazi propaganda was rife with deceit targeted toward internal and external audiences. However, deception was not exclusively practiced by Germany during the war. For example, the Allies caught Germany largely by surprise with the invasion of Normandy on June 6, 1944. The successful Allied plan was to fool Germany into believing that the real invasion at Normandy was merely a diversion, and that the actual invasion would happen elsewhere. False orders and fake troop movements were created to mask actual troop buildups.

Lies happen around the world. The concepts of lies and deception are pancultural. Although every major world religion frowns on deception, people everywhere engage in it. However, culture also shapes how deception is enacted and understood. These volumes cover deception around the world, such as how the Spanish conquistador Francisco Pizarro deceived the Inca Empire, and how deception is approached in the Arab culture in the Middle East.

### **Politics, Commerce, and Personal Life**

No encyclopedia of lies and deception could be complete without covering lies and deception in politics. When this introduction was written, it seemed that the last major national U.S. election (Obama versus Romney) was marked by an especially high prevalence of deception. However, there is never a shortage of spin on the national news networks of FOX, MSNBC, or CNN. In the past, there was Nixon's Watergate and Bill Clinton's denial of sex with "that woman." The *Encyclopedia of Deception* covers government propaganda as well as the decline in public trust

in government—a trust that is essential for a functioning democracy—and the scandals, corruption, influence peddling, and lies by public officials that undercut this trust.

Lies abound in business and commerce. There is puffery in advertising and false claims on resumes. There are Ponzi schemes and defective product coverups.

Finally, there are lies in our personal lives. For example, Notre Dame's linebacker Manti Te'o fictitious girlfriend was a recent example that captured wide media attention. One study found that as much as 61.5 percent of statements in important relationships were less than fully honest. Another study found that only about one-quarter of people thought that complete honesty was important in maintaining a romantic relationship, and that most people think that being honest depends on the situation. However, discovered lies can also harm relationships, especially when the lies are about important issues.

While one might think that one is better able to detect lies from people close to one as opposed to strangers, the opposite seems to be the case. Steven McCornack's well-known research finding was that as one develops close relationships, trust and truth bias increases, and truth bias blinds one to a partner's lies.

This two-volume *Encyclopedia of Deception* provides nearly 350 entries examining all facets of lying and deception. Philosophical and historical perspectives are offered. Examples of deception from around the world and throughout history are recounted. The new social science of deception receives compressive examination, and deception in relationships and popular culture are also covered. On behalf of the excellent contributors, we hope you find this both a valuable reference set and an entertaining and engaging reading experience.

Editor

# Chronology

---

**3rd century B.C.E.:** Archimedes (ca. 287–212 B.C.E.) discovers that he can determine the purity of gold in a crown by measuring how much water it displaces. If it is made of solid gold, it will displace the same amount of water as an equal weight of pure gold, whereas if it is made of gold combined with a lighter metal, it will displace more water.

**ca. 8th century C.E.:** A forged document, the Donation of Constantine, is used to justify papal supremacy.

**ca. 13th century:** Christian crusaders in the Holy Land create forged versions of the coins used by the local population.

**1699:** The English con artist and counterfeiter William Chalone is executed; Sir Isaac Newton, master of the Royal Mint, plays a key role in his conviction.

**1702:** The British collector William Charlton claims to have found a rare yellow butterfly with an unusual pattern of black spots on its wings. It is included in the 12th edition of Carl Linnaeus's *Systema Naturae*, but is later found to be a hoax, a common Brimstone butterfly with painted spots.

**1720:** In England, the value of a share of stock in the South Sea Company rises from 128 pounds in

January to over 1,000 pounds by August, only to fall to 100 pounds by the end of the year; this is known as the “South Sea bubble.”

**1760:** *Fragments of Ancient Poetry Collected in the Highlands*, marketed as an English translation of work by the 3rd-century Gaelic poet Ossian, is published. It is later revealed to be the work of James Macpherson, a contemporary Scotsman.

**1784:** The French Academy of the Sciences investigates the works of Anton Mesmer, who claims that he can heal illness through the use of magnets. The academy concludes that Mesmer's results were from the power of suggestion.

**1836:** The European naturalist Constantine S. Rafinesque claims to have discovered the Walam Olum, a document written in the Lenape language (used by the Delaware Indians) on bark, describing how the Indians populated North America. It is believed for decades to be genuine; not until 1996 was it demonstrated to be a hoax, as an examination of Rafinesque's papers proved that he first wrote it in English, and then translated it into Lenape.

**1840:** England issues the first postage stamp, the “penny black.” Forged versions began appearing within a year.

**1841:** The Scottish author Charles Mackay publishes *Extraordinary Popular Delusion and the Madness of Crowds*, reporting on a number of historical phenomena including economic bubbles, prophecies, fortune telling, and witch hunts.

**1848:** American sisters Katherine and Margaret Fox report hearing strange rappings in their home, reportedly the result of spirit communications, and later put on public exhibitions of similar rappings. Scientist Sir William Crookes, among others, is taken in by their performance, which the sisters later reveal (in 1888) that they produced by cracking their toe joints.

**1857:** The *Boston Courier* offers a \$500 prize for anyone who can produce a spiritualistic phenomenon in the presence of Benjamin Pierce, E. N. Horsford, and Louis S. Agassiz, professors at Harvard. Several well-known mediums try and fail to produce evidence sufficient to claim the prize.

**1861:** William H. Mumler, an engraver in Boston, begins selling “spirit photographs,” portraits in which a mysterious second image appears with as that of the sitter. Mumler was exposed as a fraud in 1863 when someone recognized that the “spirits” bore a remarkable resemblance to living persons in Boston.

**1863:** The U.S. Congress passes the False Claims Act, also known as the Lincoln Law because it was passed during Abraham Lincoln’s presidency, in response to high levels of fraud perpetrated during the Civil War. The act allows people to report cases of suspected fraud against the government and collect a portion of the damages recovered.

**1864:** Samples from a meteor shower in southern France are collected and sent to various museums around Europe. In the 1960s, several researchers examined the samples in the Musée d’Histoire Naturelle in Montauban, France, and found that they had been tampered with. Fragments of plants and coal had been inserted into the meteorite fragments, and the results were coated with glue to recreate an apparent fusion layer on the outside of the fragments.

**1866:** A human skull is discovered in a mine in Calaveras County, California. It is originally accepted as authentic, and is judged to be from the Pliocene age, making it the oldest human skull discovered in America. However, in the early 20th century, it was determined to have been planted at the site as a practical joke.

**1879:** Sarah Howe establishes the Ladies’ Deposit Bank in Boston, offering returns of 8 percent monthly, and only accepting deposits from women. In 1880, a run on the bank demonstrated that the operation was a scam, and an estimated 800 women lost more than \$250,000 in the process. Howe was sentenced to three years for obtaining money on false pretenses.

**1882:** The Society for Psychical Research authenticates Douglas Blackburn and G. A. Smith as having genuine telepathic powers. In 1908, Blackburn revealed the methods they used to fool the examiners.

**1891:** In Germany, William Van Osten claims that his horse, Clever Hans, can do mathematical calculations. This skill was later shown to be the result of unconscious signaling by the owner to his horse, a type of cuing now known in psychology as the ideomotor effect, or the Clever Hans phenomenon.

**1892:** The Ouija Board, a purported method of contacting spirits, is patented in the United States.

**1893:** German psychologist Max Dessoir publishes an article, “The Psychology of Ledger-demain,” which claims that the ability of magicians to fool their audience depends on a partially inherited ability to guide the thoughts of others to a desired conclusion.

**1900:** American psychologist Joseph Jastrow publishes *Fact and Fable in Psychology*, including a chapter on “The Psychology of Deception,” which discusses the uncertainty of knowledge from sensory information and a doctrine of unconscious inference.

**1900:** American psychologist Norman Triplett writes his Ph.D. dissertation on the psychology

of conjuring deceptions, in which he argues that primitive men developed to gain control over their peers. Triplett also believed that deception was common among young children, and as part of his work collected over 300 examples of spontaneous deception by children aged 3 and younger.

**1908:** German American psychologist Hugo Münsterberg publishes *On the Witness Stand*, which includes descriptions of experiments suggesting that eyewitness memories are not infallible.

**1912:** Charles Dawson launches the Piltdown Man hoax, displaying a fossilized skull reportedly discovered in a gravel pit in East Sussex, England. The skull was accepted for several decades as that of a modern human, forming a “missing link” in the evolution from apes to modern humans. In 1953, the Piltdown Man was determined to be a forgery, made up of a modern human skull and the jawbone of an orangutan.

**1917:** U.S. President Woodrow Wilson creates the Committee on Public Information when the United States enters World War I; this government office is the first in modern history to engage in large-scale propaganda dissemination.

**1917:** Creation of the first of several Cottingley fairy photographs, purporting to capture “real” fairies on photographic film. Sir Arthur Conan Doyle was among the many people fooled by these photographs; the girls who created them, Elsie Wright and Frances Griffiths, later admitted that they faked the pictures using paper cutouts from a children’s book.

**1920:** Italian immigrant Charles Ponzi is arrested in the United States for running a scheme, which coined the term *Ponzi scheme*. Ponzi claimed to produce a 50 percent return in 90 days, which was temporarily supported by the attraction of money from new investors (rather than any actual plan of investment). Ponzi was deported to Italy in 1934 after his involvement in another scam involving Florida real estate.

**1921:** John August Larson develops an early version of the lie detector, or polygraph, to aid in

determining the truth of answers given by those suspected of crimes. He automatically records a subject’s blood pressure and breathing depth as he or she is asked a series of routine questions and questions related to a specific crime.

**1923:** The International Criminal Police Organization (INTERPOL) is founded in Vienna as the International Criminal Police Commission. The purpose of INTERPOL is to facilitate cooperation among police forces in different countries.

**1925–26:** Adolf Hitler publishes *Mein Kampf*, a combination of biography and political statement; it includes comments on how to successfully use propaganda.

**1926:** In an attempt to demonstrate that acquired characteristics can be inherited (Lamarckian genetics), Austrian scientist Paul Kammerer conducts a series of experiments on the midwife toad. However, his apparent success in demonstrating that these toads, if forced to mate in water, would develop the black scaly bumps typical of toads that naturally mate in water is demonstrated to be a hoax, caused by injecting ink under the frogs’ skin.

**1931:** Lloyd’s of London begins offering a discount on their insurance rates to banks that require their employees to take lie detector tests. An astonishing number (10 to 25 percent) of employees admit to stealing, usually from petty cash.

**1937:** Edward Filene establishes the Institute of Propaganda and Analysis to help educate Americans to spot techniques commonly used in propaganda and reducing the effects of such techniques.

**1937:** Frank J. Wilson, newly appointed head of the U.S. Secret Service, begins a strenuous campaign against counterfeit currency that is credited with reducing losses from counterfeiting by 93 percent.

**1940:** American linguist David W. Maurer, a specialist on the language used by members of marginal American subcultures, publishes *The Big Con*, based on interviews with hundreds of con artists and other criminals.

**1945:** Leonarde Keeler is brought in to conduct polygraph tests on German prisoners in an Arizona prisoner-of-war camp to determine which of them harbors Nazi sympathies or otherwise poses a threat to the United States.

**1946:** English author George Orwell, in his essay, “Politics and the English Language,” criticizes the way that politicians use language to mislead people and hide the truth, and charges that bad writing habits can interfere with clear thinking.

**1947:** The Dutch painter Hans van Meegeren is convicted of forgery. His most notable work was a number of paintings that he claimed were painted by Vermeer, and which had been accepted by experts as genuine.

**1947–53:** Workers at the nuclear facility in Oak Ridge, Tennessee, are subjected to numerous polygraph tests, partly in response to the belief that Soviet spies had infiltrated the facility.

**1953:** *Flying Saucers Have Landed*, the first of several books by George Adamski that purport to describe his experiences traveling in outer space and communicating with extraterrestrial beings, is published.

**1955:** The London Society for Psychical Research publishes a report on the Borley Rectory, a purportedly haunted house built in 1863 in England, concluding that all reported phenomena could be explained by ordinary, natural causes.

**1959:** In the United States, the National Labor Relations Board rules that polygraph tests can be required as a condition of employment.

**1968:** American magician and skeptic James Randi offers a prize of \$1,000 for anyone who can produce evidence of paranormal activity before a group of witnesses, on terms agreed upon by both parties. The value of the prize has since been increased to \$1 million, but no one has successfully claimed it.

**1968:** Erich von Däniken publishes *Chariots of the Gods? Unsolved Mysteries of the Past*, arguing that the knowledge and technology required to

produce various aspects of ancient religion and culture (e.g., Stonehenge and the pyramids of Egypt) were brought to Earth by visitors from outer space.

**1968:** The discovery of a pattern on the ocean floor near Bimini, an island in the Caribbean Sea, leads to claims that it was once a road, and the area is the location of the “lost continent” of Atlantis. In fact, the road-like features are part of a now-submerged coastline of the island.

**1970s:** Israeli performer Uri Geller frequently appears on television, demonstrating his apparent ability to exert physical effects (e.g., bending spoons) by only using the power of his mind. However, skeptic James Randi and others have since demonstrated that all of Geller’s performances could be produced using tricks known to many magicians.

**1970–75:** *The Amazing World of Kreskin*, a television program starring George Joseph Kresge (a.k.a., the stage magician The Amazing Kreskin), is produced in Canada and broadcast in Canada and the United States. A key feature of the program is Kreskin’s ability to “read” the audience to discover where his check for the evening’s performance has been hidden; he does not claim to have paranormal powers, but instead relies on interpreting voices and body language.

**1972:** Psychologist Elizabeth Loftus publishes “Reconstructing Memory: The Incredible Eyewitness” in *Psychology Today*, detailing how it is possible to alter a person’s memory of an event by asking leading questions or introducing other information.

**1972:** John D. Bransford and Marcia K. Johnson publish research showing that contextual information, such as providing titles to brief paragraphs to establish a context, affected encoding of the information in the paragraph. Providing such information before the subjects read the paragraph produces greater comprehension and recall than providing it after the paragraph.

**1974:** Charles Berlitz publishes *The Bermuda Triangle*, claiming that mysterious forces within an area defined by Florida, Bermuda, and Puerto

Rico pose grave dangers to ships and airplanes. The book is partially based on a 1944 incident in which five U.S. Navy planes were lost in that region.

**1974:** Dermatologist William T. Summerlin, working at the Memorial Sloan-Kettering Cancer Center in New York City, claims to have successfully grafted skin from a black mouse to a genetically unrelated white mouse. However, this claim is later determined to be fraudulent when the “black” skin patches are determined to have been colored by a felt marker, rather than originating from a black mouse.

**1975:** John Nance publishes *The Gentle Tasaday: A Stone Age People in the Philippine Rain Forest*, describing an isolated tribe living a primitive and peaceful lifestyle in the rain forest, without corruption or conflict. The story, originally perpetuated in 1971 by Manuel Elizalde Jr., the adviser to Ferdinand Marcos on Filipino national minorities, is exposed as a hoax in the 1980s, when tribal members said they were poor and had been pressured by Elizalde to live like a Stone Age tribe in order to receive assistance and serve Elizalde’s political agenda.

**1976:** American Morris Lamar Keene publishes *The Psychic Mafia*, describing how he previously posed as a psychic, tricking thousands of people into believing that he had powers to contact spirits.

**1976:** The Committee for Scientific Investigation of Claims of the Paranormal (CSI-COP) is founded in Buffalo, New York, to investigate claims of paranormal phenomena. CSI-COP publishes the *Skeptical Inquirer*, a journal carrying news of paranormal investigations.

**1977:** British painter Tom Keating is charged with forgery; although the charges are later dropped, he admits that he produced paintings attributed to a number of noted artists, including John Constable, J. M. W. Turner, Claude Monet, and Vincent Van Gogh.

**1977:** American psychologist Philip Zimbardo and colleagues coin the term *the illusion of personal invulnerability* to refer to the reaction of

people when they hear of someone else victimized by a hoax; it rests on the probably unwarranted assumption that the listeners would have seen through the hoax.

**1978–83:** German forger Konrad Kujau creates the “Hitler Diaries,” which are later published in the German magazine *Der Stern*. Although some experts believe them to be genuine, they are later revealed as fake.

**1979:** Crop circles, complex geometric patterns created by flattening parts of grain fields, begin to appear in the United Kingdom. Although some believe that they are evidence of visitors from outer space, in 1992, two British men admitted to creating the first crop circles.

**1979:** Psychologist Elizabeth Loftus becomes the first person in Washington State to provide expert testimony about eyewitness identification. She testifies on the behalf of the defense in a murder trial, explaining how memory distortion can influence eyewitness testimony.

**1984:** Poltergeist phenomena are reported in the Columbus *Dispatch*, a newspaper in Ohio. The story received widespread coverage, but it was later shown to be the result of tricks by a 14-year-old girl, Tina Resch.

**1985:** Psychologist Bella M. DePaulo and colleagues establish that while young children frequently attempt to lie to adults, they are seldom successful; however, by the time they are fifth graders, children can often construct lies that fool adults, including their parents.

**1986:** Dutch primatologist Frans de Waal reports that chimpanzees engage in many apparently deceptive behaviors, such as pretending to ignore the presence of hidden food when another chimp is present. However, de Waal also acknowledges that it is impossible to establish intentionality in such cases.

**1987:** D. L. Delanoy and colleagues report on the results of a teenager who claimed to have psychic abilities and took part in over 20 testing sessions at the University of Edinburgh. The teenager was able

to bend metal objects under informal conditions, but never when strict controls were in place. In the final testing sessions, a hidden camera captured evidence that the teenager was performing tricks to produce his results. Delanoy and colleagues note that they were easily fooled by the teenager, and found him convincing until the hidden camera revealed how he was achieving his results.

**1987–89:** John Jacob Cannel investigates score inflation in standardized educational tests. One result of his study is the finding that in 48 of 50 states, students report performing above the national average, a result christened the “Lake Wobegon effect,” in reference to the fictional location in which all the children are above average.

**1992:** The Innocence Project is founded at Yeshiva University with the purpose of using DNA evidence to exonerate individuals who have been wrongfully convicted. As of 2012, over 290 people have been released as a result of the Innocence Project’s work and, because the trials of many of the wrongfully convicted included eyewitness testimony, the Project also played a key role in questioning eyewitness accuracy, reinforcing similar evidence found in scientific research.

**1994:** In *Ramona v. Isabella*, Gary Ramona successfully establishes that his daughter’s psychotherapists implanted false memories in his daughter’s mind, leading to her accusations of his sexual abuse of her as a child. He is awarded \$500,000 in damages for lost wages, and the case sets a precedent because third-party negligence suits were previously rare and seldom victorious.

**1994:** Professor Linda M. Williams publishes a study supporting the contention that memories of sexual abuse are sometimes repressed. For the study, she interviewed 129 women who were known to have been sexually abused—based on hospital records of their treatment for the abuse—and found that 38 percent of them failed to mention the abuse, even when specifically questioned about it.

**1995:** Nicholas Leeson, a British broker for Barings Bank in the United Kingdom, is convicted in Singapore of forgery and other acts of fraud.

Leeson had been engaged in speculative trading since 1992, using a Barings “error account” to hide his losses, which reached over \$1 billion by 1995, and caused Barings Bank to collapse.

**1996:** Alan Sokal, a physics professor, publishes the article, “Transgressing the Boundaries: Towards a Transformative Hermeneutics of Quantum Gravity” in the journal *Social Text*. He later reveals that the article was a hoax, submitted to demonstrate the lack of intellectual rigor in the journal and in the field of cultural studies more generally.

**1998:** British physician Andrew Wakefield publishes case studies claiming to support a link between autism and the childhood measles, mumps, and rubella vaccine. This report is later determined to be based on faked data, and in 2010, Wakefield’s name is struck off the Medical Register and he is barred from practicing medicine in the United Kingdom. Many of his supporters still believe that vaccines can cause autism, and refuse to have their children injected with the vaccine.

**1998:** The journalist Stephen Glass is discovered to have falsified all or part of at least 27 stories he wrote for the *New Republic* magazine from 1995 to 1998.

**1999:** The Canadian theatrical producers Garth Drabinsky and Myron Gottlieb are indicted in New York on charges of fraud and embezzlement in connection with the Canadian production company Live Entertainment Corporation of Canada Inc. In 2009, both were convicted of fraud and forgery in Canada; they remain under fugitive arrest warrants in the United States.

**1999:** The National Geographic Society announces that a fossil discovered in China establishes the validity of the hypothesized link between dinosaurs and modern birds; it has the body of a bird and the tail of a dinosaur. However, this discovery is quickly recognized as a fraud, made up of two separate fossils. In March 2000, *National Geographic* published an admission of the error.

**1999:** In the United States, the Department of Energy resumes the use of mandatory polygraph tests for people working in nuclear weapons labs.

**2000:** The film *Boiler Room*, distributed by New Line Cinema, dramatizes a “pump and dump” operation in which a crew of young salesmen sell overvalued or worthless stock shares over the phone to customers by misleading them about the shares’ values; causing the shares to temporarily rise in price.

**2000:** Eastgate Elementary School in Columbus, Ohio, is praised by President Clinton for the improved standardized test scores of its students. However, several students from the school later come forward and say that they were given correct answers on the test by a teacher’s aide.

**2000:** The Japanese archaeologist Shinichi Fujimura admits that many of his “discoveries” were fakes, after a newspaper produces photographs showing him burying artifacts on a site in Miyagi Prefecture, where he would later “discover” them.

**2000:** Professors Barbara Tversky and Elizabeth J. Marsh publish research indicating that memories are altered by retelling events and changing the context in which they are retold because retelling involves selectively retrieving and using information.

**2000:** Jonathan Lebed, a New Jersey high school student, becomes the youngest person to face charges of stock fraud. He bought stocks and promoted them on Internet message boards using multiple aliases, then sold them after the price rose (a “pump and dump” scheme). The case was settled in 2001, when Lebed agreed to forfeit a share of his profits.

**2001:** On December 2, American energy company Enron files for bankruptcy amid widespread indications of fraud. It is the biggest bankruptcy in the United States, and Enron shares are worth less than \$1 on the day of the bankruptcy filing, as compared to a high of over \$90 per share in August 2000.

**2001:** Martha Stewart, an American publisher and media personality, is accused of engaging in insider trading by ordering her broker to sell shares of ImClone Systems immediately before

news became public that the U.S. Food and Drug Administration would not approve a new drug created by ImClone. Stewart is later convicted of obstruction of justice, and is sentenced to six months in jail. ImClone CEO Samuel Waksal, who provided her with the information, is sentenced to seven years.

**2002:** Accounting firm Arthur Anderson is found guilty of obstruction of justice over its part in destroying documents related to the Enron scandal. Although this decision was overturned by the U.S. Supreme Court in 2005, the company did not resume operations because its reputation was destroyed.

**2002:** Economists Stephen Levitt and Brian Jacob examine standardized test results from the Chicago Public Schools from 1993 to 2000 and charge that cheating occurs in 4 to 5 percent of classrooms each year. Their results, which are based on the examining patterns of answers on test sheets, are supported when students in classes suspected of cheating retake the test under close supervision and score substantially lower.

**2003:** Bernie Ebbers, cofounder and chief executive officer of WorldCom, is convicted of fraud. WorldCom’s bankruptcy in 2002 was the largest in history until Lehman Brothers went bankrupt in 2008.

**2003:** Jayson Blair, a 23-year-old reporter for the *New York Times*, is dismissed after it is revealed that he had plagiarized and/or fabricated information in numerous stories written for the *Times*. Executive Editor Howell Raines and Managing Editor Gerald Boyd also resigned from the *Times* over the scandal.

**2004:** In the United States, the Federal Bureau of Investigation announces that, since 2000, its investigations into financial fraud have resulted in over 11,000 convictions and over \$8.1 billion in restitution orders.

**2004:** In Birmingham, Alabama, the director of a general educational development (GED) program finds that 5.6 percent of the student population of one high school, Woodlawn, was forced

to withdraw before the state standardized tests were administered because they were projected to receive low scores, thus lowering the school average.

**2006:** The Brennan Center for Justice, part of the New York University School of Law, reports that voter fraud is extremely rare; for instance, it occurred about 0.0009 percent of the time in the 2004 Washington gubernatorial election.

**2006:** John Paul Lewis, Jr., is convicted of fraud for a long-running Ponzi scheme in California, and sentenced to 30 years in prison.

**2008:** American broker Bernard Madoff is revealed to be running a Ponzi scheme involving thousands of investors and over \$65 billion in investments. In 2009, he was sentenced to 150 years in federal prison.

**2008:** The U.S. Securities and Exchange Commission (SEC) announces that it has halted a Ponzi scheme targeting the Haitian American community through a series of investment clubs.

**2008:** Lou Pearlman, well known for his work creating and promoting boy bands such as ‘N Sync and the Backstreet Boys, is convicted of conspiracy, money laundering, and other charges as part of a Ponzi scheme he operated for over 20 years.

**2009:** Marcus J. Schrenker, an investment adviser facing charges of defrauding investors, attempts to fake his own death in January through a plane crash.

**2009:** The SEC obtains a court order to halt a Ponzi scheme targeting members of the deaf community in Japan and the United States; the scheme is run by Billion Coupons Inc., a company based in Hawaii.

**2009:** Marc S. Dreier pleads guilty to investment fraud over a Ponzi scheme that stole a reported \$380 million. He also faces charges in Canada for impersonating a lawyer in connection with the sale of financial instruments to the Ontario Teachers’ Pension Plan.

**2010:** Harry Markopolos publishes *No One Would Listen: A True Financial Thriller*, detailing how he uncovered Bernard Madoff’s financial deceptions years before the scandal became public, and his difficulties in having the SEC take note of his investigations.

**2010:** *Inside Job*, a documentary directed by Charles Ferguson, examines the causes behind the global financial crisis of 2008; it wins the Oscar for Best Documentary.

**2011:** In the United States, the Centers for Medicare and Medicaid Services begins screening Medicare fee-for-service claims through its Fraud Prevention System, a process similar to the screening technology used by credit card companies.

**2011:** In Los Angeles, the director of Crescendo charter schools is found to have ordered the principals in its six schools to literally teach to the test to raise student scores on the state standardized tests. The principals were ordered to open the seal on the state exams and teach students using the actual test questions.

**2011:** Raj Rajaratnam is convicted on fraud charges in connection with his activities with Galileo Group, one of the world’s largest hedge funds.

**2011:** Dutch social psychologist Diederik Stapel is suspended from his post at Bilburg University on the basis of alleged scientific misconduct, including fabricating data.

**2011:** The U.S. government announces that it has recovered over \$10.7 billion in fraudulent health care claims over the past three years, with \$4.1 billion in fiscal year 2011 alone.

**2011:** The Atlanta *Journal-Constitution* reports on a widespread cheating scandal in the Atlanta public schools, in which cheating was so commonplace in some schools that teachers organized “erasure parties” to change numerous student answers on test forms from incorrect to correct.

**2011:** The scientific journal *Nature* issues a report stating that published retractions of scientific papers has increased 10 times over the past

decade, while the number of published papers has increased only 44 percent in the same period. The most common reason cited for retraction is misconduct, including falsified data and plagiarism.

**2012:** Production of the Broadway musical *Rebecca*, based on the Alfred Hitchcock film, is delayed when about one-third of the show's financing evaporates, reportedly due to the death of an investor who was later determined to be fictional. Several individuals are under criminal investigation in the matter, and a civil lawsuit is filed against Mark Hotton, who acted as a middleman between the show's producer and the alleged investor.

**2012:** Citigroup agrees to pay over \$158 million to settle multiple cases of mortgage fraud, including its applications for FHA mortgage insurance for about 30,000 mortgages using certifications that were known to be false. About one-third of the mortgage loans in question went into default.

**2012:** About 70 students at New York City's prestigious Stuyvesant High School are placed under investigation in a cheating scandal. The students are accused of electronically sending or receiving answers (including by smartphone) to Advanced Placement exams given at the school in June.

**2012:** Rajat K. Gupta, a former director of Goldman Sachs, is convicted of passing insider information to Raj Rajaratnam, the former head of the hedge fund Galleon Group.

**2012:** As of October, 19 U.S. states have regulations (executive actions or laws) aimed at preventing voter fraud, such as requiring prospective voters to present an approved photo ID at the polling place.

**2012:** The U.S. Medicare Fraud Strike Task Force files charges in October against 91 individuals for participating in various fraudulent activities,

resulting in \$432 billion in false billing, including over \$100 million in community health care fraud, \$49 billion in ambulance fraud, and over \$230 million in home health care fraud.

**2012:** Lorraine O. Brown pleads guilty in November to charges of criminal fraud. Brown, the former president of DocX, one of the largest foreclosure-processing companies in the United States, admits to participating in the falsification of over 1 million mortgage documents, many of which were used in foreclosure proceedings.

**2012:** A cheating scandal at Harvard implicates about half the students in a 279-person undergraduate class, including a number of prominent athletes. The basis for the allegations are identical or nearly identical responses submitted as part of the class's take-home final.

**2012:** Falko Bindrich, a German chess grandmaster, is accused of cheating during a November match by using his smartphone to access a chess program during breaks. He refuses to let officials inspect his phone, and forfeits the match.

**2013:** Cycling champion Lance Armstrong admits that he engaged in an organized and long-term program of blood-doping and the use of performance-enhancing drugs, despite previously having denied the use of artificial enhancements while he was competing.

**2013:** Europol, the law enforcement agency of the European Union, announces that an 18-month investigation yielded evidence suggesting match-fixing in 680 soccer games played in 15 countries, including World Cup qualifiers and Champions League games.

## Academia

Deception is used by students, teachers, professors, administrators, and principals within academic institutions. The use of deception has been documented within all levels of education, from elementary school through graduate education. An analysis of 46 studies on academic dishonesty revealed that there is great variety in the prevalence of cheating, which ranged from 9 to 95 percent of students, with a mean of 70.4 percent. Considerable variability was also found depending on the type of cheating that was measured: Cheating on examinations ranged from 4 to 82 percent of students, with a mean of 43.1 percent; cheating on homework ranged from 3 to 83 percent of students, with a mean of 40.9 percent. The prevalence of plagiarism ranged from 3 to 98 percent of students, with a mean of 47 percent.

Research suggests that individual characteristics can be used to predict which students are more likely to engage in deception. Deception varies by age; younger students are more likely to engage in these behaviors than older students. Additionally, research suggests that males are somewhat more likely than women to engage in deception. In terms of academic indicators, students with lower grade point averages (GPAs), who perform worse on the type of task they are engaged in, and

who tend to perform more poorly on coursework in general, are more likely to engage in academic lying and deception.

Situational factors also impact whether or not individuals engage in lying and deception. Descriptive norms (i.e., whether people believe that others in society engage in deception) has been found to predict these behaviors, such that when descriptive norms suggest that many people lie in society, people are more likely to lie. Descriptive norms are especially powerful when people believe that in-group members engage in deception. Conversely, if the environment makes morality salient (e.g., thinking of religious values or honor codes) there is a decrease in the amount of deceptive practices that people engage in.

### Deception for Personal Gain

People are generally motivated to deceive others within academia to either benefit themselves or to benefit the academic institution that they attend, or where they are employed. When people engage in these behaviors for personal gain, the main motivational component that drives people is the desire for academic advancement. Academic advancement can take multiple forms: (1) promotion to a higher level of education (e.g., graduating to a higher grade or gaining acceptance into an undergraduate or graduate institution); (2) obtaining a job within academia; or (3) inflating one's

status within academia to obtain social or material rewards.

First, when individuals engage in lying and deception as a way to increase their likelihood of promotion to a higher level of education, they may engage in a multitude of different behaviors, such as cheating on tests or lying in order to obtain more time to work on an assignment, or they may engage in plagiarism. More subversive kinds of academic deception take the form of falsifying important information about one's academic performance on college applications (e.g., including false information on one's resume or curriculum vitae). Student athletes may also engage in deception by taking drugs, such as steroids, to make it appear that they are better players and to increase their likelihood of being accepted by prestigious academic institutions later in their academic career.

Second, when individuals lie or use deception to increase their chances of obtaining a job within academia, they may also falsify information regarding their academic standing (e.g., graduate GPA), or they may include false information in cover letters, their resume, or curriculum vitae. These individuals may also exaggerate the extent of their experience or their own level of competence within areas that are relevant to the desired job.

Third, when attempting to increase one's status to obtain social or material rewards, teachers, professors, administrators, and principals may exaggerate their professional accomplishments when talking with colleagues, supervisors, and committees. Within elementary, middle, and high schools, teachers may give their students inflated grades to improve perceptions of their performance by increasing the passing rate within their classes. Additionally, professors who conduct research within academia may engage in academically fraudulent activities such as fabricating or falsifying data, engaging in inappropriate statistical techniques in order to obtain desired results, or reporting information that is not supported by the data.

### **Deception to Benefit an Academic Institution**

On the other hand, people may lie and deceive not for personal gain, but in an attempt to

*Seaman Erin Koecke takes notes during an intermediate college algebra course aboard the aircraft carrier U.S.S. John C. Stennis, where professors are brought onboard to teach classes, October 9, 2008. Students who attend schools with policies that enforce academic honesty report engaging in less academic dishonesty.*

obtain some benefit for their academic institution. When trying to recruit new students, universities may engage in multiple types of deception. They may exaggerate the success rates of their graduates in obtaining jobs after graduation. They may also misrepresent the academic success of students at their institution in order to gain higher status among organizations that rank colleges (e.g., *U.S. News & World Report* and the *Princeton Review*). This is done in order to make their institution appear more attractive to potential applicants.

Additionally, some universities misrepresent the prevalence of racial minorities on the college

campus in advertising materials, such as online Web sites and pamphlets. In this way, the college depicts the student body as being a more diverse environment than it actually is as a strategy for attracting minority and international students.

The most direct way in which institutions benefit from lies and deception is when teachers, administrators, and principals report inaccurate test scores that determine the amount of public funding that their institution will receive. In the past, administrators in elementary and middle schools reported the national test scores of their schools, excluding the results of low-achieving students (e.g., special education students). In this way, the administrators increased the overall scores at their institution, which increased the funding that they were given.

Institutional lying and deception also occurs within athletic departments. Teachers may misreport athletes' grades when they are low because those grades would disqualify the student from participating in important sporting events. In this way, the academically underachieving athletes continue to play, which can increase the team's performance and may result in greater funding for the athletic department.

### **Ramifications of Deception**

The consequences of engaging in deception within academia widely vary. In some circumstances, these behaviors may go unnoticed and unpunished. However, these behaviors are often revealed, and people receive a variety of penalties for their actions. Deception produces personal, institutional, and societal ramifications.

The personal ramifications of engaging in deception within academia widely vary based upon the type of deception used, as well as the status of the individual (e.g., students versus administrators). Students who engage in minor types of deception may receive mild repercussions, such as a verbal reprimand from their teacher or professor. However, if students engage in more serious indiscretions, they may fail the class they are in or may even be expelled from their school or university. Additionally, individuals with higher status positions within academia (e.g., teachers, professors, administrators, and principals) may experience a wide range of outcomes, the more extreme of which include

losing one's job, being blacklisted within their profession, and being charged with fraud if the individual received grant money from the government that they misused (e.g., a professor who fabricated data).

The institutional ramifications of lying and deception may have a large impact on institutions' reputations. If potential applicants become aware that false information has been used to inaccurately describe the institution, this may tarnish the institution's reputation and make applicants disinterested in applying to the institution. Additionally, potential donors may be less likely to invest in institutions that engage in unethical practices.

There also are societal ramifications of deception. When people engage in lying and deception in order to be promoted to higher levels of education, obtain jobs, or gain higher status, they gain access to situations to which they would not have had access if they had proceeded in a legitimate manner. In this way, students are promoted to higher grades, even though they do not have the requisite skills. Similarly, people may obtain jobs for which they are not qualified. Last, individuals may obtain social or material benefits associated with having high status in their field (e.g., becoming a tenure track professor) that they do not deserve. This creates a societal problem by decreasing the quality of education that students receive and lessening the quality of goods and services that are available within society.

### **Prevention**

There have been multiple attempts to dissuade students from engaging in deception. One method is to minimize the opportunities for lying and dishonesty. An example of this would be using teachers, professors, or proctors to monitor students and actively discourage cheating during a testing situation. Additionally, professors may use plagiarism-prevention software such as Turnitin, which compares students' papers with a large database comprised of journal articles, students' papers, and other publications in order to determine whether the student bought their term paper online or plagiarized from the existing literature. Finally, many academic institutions have instituted policies and punishments for cases of academic dishonesty.

Having teachers or professors communicate and enforce the institution's academic policies has been found to be an effective method for discouraging lying and deception within academia. Students who attend universities with policies that enforce academic honesty report engaging in fewer academically dishonest behaviors.

## Accounting

The work of accounting is fraught with ethical considerations. Similar to physicians who must take the Hippocratic Oath, for example, accountants are bound by ethics not to reveal what they know about their clients' finances. An accountant, like a physician, knows intimate details about the lifestyle and activities of a client as expressed in their monetary habits and practices. Therefore, moral character and ethical practices

are a necessary part of the professional practice of accounting.

### History of Accounting

Accounting is a system for recording, managing, and summarizing business activities. The earliest accounting tool was likely knots tied in a string or rope to count livestock. In the ancient Middle East, some of the first accounting records were written on cuneiform tablets. Some of these surviving tablets record stores of goods, taxes, and other business activities. The Egyptians recorded their business activities on papyrus rolls.

The earliest Chinese emperors used accountants to record and manage royal property. The ancient Greeks created a commercial empire using coins, which had only recently been invented by their Lydian neighbors. Accounting used by the Greeks was further extended by the Romans. The end of the Roman Empire created a millennium in which little use was made of accounting techniques besides simple bookkeeping.

At the height of the Italian Renaissance, Luca Bartolomeo de Pacioli, a Franciscan friar, published *Summa de Arithmetica* (1494) in Venice. The book was a mathematics textbook that used Arabic numerals and described both algebra and double-entry accounting. In effect, Pacioli described the method of bookkeeping that Venice merchants were using, the double-entry system of assets and liabilities (credits and debits) used to this day. He also described balance sheets, journals, ledgers, and different kinds of accounts, such as those for receivables and inventories. The *Summa* has earned Pacioli the title of the Father of Accounting. However, Pacioli never claimed to have invented it, instead citing Benedetto Cotrugli as the originator of double-entry bookkeeping. Cotrugli had written, but had not published, a short manuscript titled *Delia Mercatura et del Mercanted Perfetto* (*Of Trading and the Perfect Trader*) in which he gave a general description of the subject. Pacioli also included a discussion of ethics and accounting.

### The Language of Business: Applied Ethics

The complicated field of accounting has been called the language of business. It often involves complex issues of business practices and tax laws. While accountants have a popular image as soulless drones, they are required by their work to

have imagination and wise judgment. Accounting plays an important role in the management of finances and business operations in public, private, and nonprofit activities.

The field of accounting ethics, which studies moral values and judgments about accounting decisions, encompasses a variety of applied ethics. It is also a type of professional ethics. Ethics and accounting can be illustrated in the parable that Jesus told about the unjust steward (Luke 16:1–13) who skimmed his master's accounts in order to curry favor with his master's debtors.

The field of accounting has received renewed and increased attention in recent years because of the wide range of new accounting services and the unethical behaviors of corporate managers and accountants, some of which caused the collapse of corporations. Both public and private organizations have developed new regulations to promote ethical behavior among accountants. This emphasis on ethics is vital to the profession because businesses and investors depend on the accuracy and honesty of financial reports prepared by accountants. Without reliable accountants and auditors, business transactions are suspect, and are therefore unreliable for making sound business or investment decisions.

Ethical knowledge is vital to accountants if they are to resolve the ethical dilemmas that they may face. Making sound, ethical business and financial decisions is vital for financial success and winning personal or public approval. These decisions will benefit not only companies, but also the general public.

### **Accounting Ethics in Academia**

In 1988, Stephen E. Loeb adapted a list of educational instructional objectives from the work of Daniel Callahan. Loeb proposed the educational goals in ethics for accounting, which were to relate accounting to moral issues, develop skill in recognizing the ethical implications of accounting issues, develop in students a sense of “moral obligation,” develop skills in ethical reasoning that would deal with ethical conflicts or dilemmas, develop skills in dealing with confusing issues in accounting practices, enable students to develop character or needed changes in ethical behavior, and develop an appreciation for the relationship of accounting ethics to the general philosophy of ethics.

In 1993, the State University of New York at Binghamton opened a center that concentrated on accounting ethics. Numerous colleges now require courses in ethics or accounting ethics for students preparing to become accountants. Practicing accountants are also likely to be required to take some continuing education in ethics. Among the practices to avoid are conflicts of interest, integrity, and confidentiality; refusal of gifts; and objectivity.

Wisdom and judgment are often necessary in order to discern what is moral and what is not. Research can provide insights, but character—which involves commitment to ethical behavior—is vital to ethics. Therefore, critics of ethics education for accountants have often denounced such education as wasteful because, as they claim, either a person has character, or they do not; in other words, if someone is lacking character, ethical education will not instill it. The educability of ethics is an issue as old as disputes that Socrates had with the Sophists.

### **Cooking the Books: Accounting Scandals**

Examples of accounting “deceit” include using bogus invoices for work that was not performed; paying fictitious employees; and using shell companies for fraudulent investments purposes. Even charities or nonprofits can be involved in accounting fraud. Many people measure the quality of a charity or other nonprofits by the ratio of its receipts to overhead costs. If the nonprofit is spending large portions of its receipts on fundraising and very little on its mission, this can cause donors to look elsewhere. However, accounting tricks have been used to make nonprofits look better than they really are by falsely interpreting overhead expenditures.

Many for-profit firms and even government organizations use “creative accounting” or “earnings management” as euphemisms for standard accounting practices that are followed to the letter, but not in spirit. Usually, these are novel ways to characterize income, assets, liabilities, or other accounting terms and practices. These practices may be employed by accountants in the service of a regular business, such as a movie company. The company may receive millions of dollars in revenues from a motion picture, but thanks to its creative accountants, it appears to fail to make a

profit, and therefore avoids taxation. Some of the most high-profile scandals that have littered the accounting landscape throughout history have involved for-profit companies.

*ProQuesta fraud.* Scott Hirsh, an executive for ProQuesta in Ann Arbor, Michigan, tried to use a simple computer trick—using the color white instead of black for certain numbers—to hide fake figures in spreadsheets. He also used hidden cells in the spreadsheet. However, when the fraud was revealed by selecting all text and changing it to black, the fraud was revealed. The SEC charged Hirsh with accounting fraud because his actions caused company profit totals to be artificially inflated.

*Crazy Eddie Company.* In the 1980s, certified public accountant Sam Antar was the chief financial officer of the Crazy Eddie Company, a retail electronics business with stores in New York, New Jersey, Connecticut, and Pennsylvania. It also did business through phone orders, and eventually via Internet sales. The company had 43 stores and sales of \$300 million before it was hit with fraud investigations. Antar, along with his cousin, Eddie Antar and his uncle, Sam M. Antar, were found to have recruited Sam Antar to engage in a major securities fraud that cost investors hundreds of millions of dollars. Eventually, some people lost their life savings, others lost their careers, and others suffered personally.

In 1987, the U.S. attorney for the District of New Jersey started investigating the Crazy Eddie Company. In September 1987, the SEC also initiated an investigation for alleged securities violations. The investigations led to indictments and eventually to convictions. However, before the investigations occurred, Eddie Antar sold millions of company stock and fled to Israel.

From virtually the beginning of their business, the Antars were “cooking the books” with false entries in their ledgers to reduce or eliminate taxable income, paying employees off the books, and skimming cash from store earnings. Their pilfering of the company amounted to about \$1 million per year. They deposited this in foreign banks, much of it in Israel. In order to hide their skimming, they began a deskimming program that lasted several years in an effort to make the company appear to be growing with significant

profits. While actual profits were growing at a 13 percent rate, the deskimming made the company appear to be growing at a 171 percent rate. When the company transitioned from a private company to a publicly traded company, investors were eager to jump in.

Sam Antar used a number of tactics to hide the Antar’s fraudulent operations. One tactic was called the “Panama pump.” The Antars transferred money that they had deposited in Israeli banks to banks in Panama with accounts in alias names. They then wrote payments to the Crazy Eddie Company, which inflated its sales figures.

Another trick was inventory fraud, which was used to inflate the value of company stock. When the Crazy Eddie fiscal year ended, an inventory figure would be posted. The next year, the value of the inventory would be reported at \$10 to \$15 million more. Other accounting tricks also reported false inventory figures. One of Sam Antar’s tricks was to distract the accountants. Generally, the independent accountants sent to review the Crazy Eddie Company books were single young men who were recent accounting graduates. Sam would pair the young male accountants with lovely young female employees in order to distract and blind them to the fraud that the Antars were committing. The Crazy Eddie Company ended in bankruptcy. Until the Enron scandal, it was the biggest accounting fraud in the United States.

*Enron.* Enron was an energy company based in Houston, Texas. It went bankrupt on December 2, 2001, because of fraud committed by its executives. Over 20,000 employees lost their jobs, and many lost their retirement savings. The company’s reported financial vitality had been falsely reported through systematic, organized accounting fraud. The scandal also destroyed the accounting firm of Arthur Andersen because its employees had colluded in the fraud. The Enron scandal was followed by the WorldCom and Tyco scandals in 2002, the HealthSouth scandal in 2003, and other cases in the following decade.

*KPMG Accounting.* In 2013, an executive accountant for KPMG Accounting was caught by the Federal Bureau of Investigation passing along confidential information about companies that he

had audited. One of the companies, Herbal Life, was already having difficulties.

In the United States, the Financial Accounting Standards Board (FASB) has been designated as the organization responsible for developing generally accepted accounting standards by the U.S. Securities and Exchange Commission (SEC). The FASB is a private, nonprofit organization created in 1973 to replace earlier organizations operated by the American Institute of Certified Public Accountants. Critics have levied hard criticism on philosophical grounds against the work of the FASB.

Most countries have laws that deal with accounting. In some countries, accounting is covered by accounting law, while in others the practice is covered by tax law or company laws. There are also standards boards in the United States and other countries.

### Incentive, Opportunity, and Rationalization

Specialists in accounting fraud have found three common elements that are involved in the activity: incentive, opportunity, and rationalization. Incentives include greed, drug use, ego issues, gambling problems, and infidelity. For example, ego trips have cost companies billions of dollars when unsupervised, egoistic traders thought they were smarter than the market. Opportunity can provide the perception that accounting fraud will not be detected. Private companies often have fewer controls than public companies, so the opportunities for accounting fraud are greater. In addition, a person committing accounting fraud often tells their conscience that the “abuse” they feel in hard times justifies them in ripping off their company or organization.

Accounting-fraud criminals point out that there is a difference between being accurate and being truthful. Financial statements may be accurate, but not truthful. In fact, perfection in accounting statements may be a sign of shady bookkeeping. The appearance of legitimacy may be falsely identified as honesty, but verification of accounting facts is paramount because that is where accounting lies can be detected.

## Adolescence, Lying in

The consensus of considerable child development research is that during adolescence, lying and deception tend to increase. Numerous studies have concluded that the majority of adolescents lie to their

parents about such things as how they spend their money, when they started dating, what clothes they wear when away from home, the movies they see, the Web sites they view, the friends they “hang” with, their alcohol and drug use, whether the parties they attended were chaperoned, and whether they rode in cars with drunken or “stoned” drivers. One study, for example, found that 98 percent of adolescents reported lying to their parents either by commission (i.e., telling deliberate falsehoods) or by omission (i.e., withholding essential details). While young children may not fully understand what constitutes lying, adolescents are fully aware of the components of a lie: (1) the communication is factually untrue, (2) the person knows the communication is untrue, and (3) the person intends to deceive the listener.

### Means and Reasons

There is considerable evidence that the “seeds” for adolescent deception may be planted during early childhood. For example, early on, when young children observe their peers misbehaving or cheating, they immediately run to tell a parent, teacher, or other adult. While they are being completely honest, this repetitive behavior eventually becomes annoying to the adult, who eventually tells the child to stop tattling and work it out on his/her own. It doesn’t take long for the child to realize that being called a “tattler” by a peer on the playground is not a good thing. During adolescence, turning in a peer for lying means “acting like a child.” So, keeping quiet after watching peers cheat, use illegal drugs, cut classes, and shoplift is easy for most adolescents because they have been reinforced for years to do so.

Adolescent lying takes many forms. Adolescents can distort the truth with contradictory information, by offering half-truths to temper the impact of the facts, by changing the subject to divert the listener, by giving the impression that they are being open by offering only limited or partial information, and by concealing or not divulging information. Many adolescents equate diverting attention, not disclosing information, and remaining silent as not lying, but just changing the subject.

There are a variety of motives or reasons that help explain why the act of lying tends to increase during adolescence. By far, the top motive that adolescents use to justify lying behavior is to

preserve their autonomy. During adolescence, youth begin to socialize more with their peers and receive less direct monitoring and supervision from parents. Thus, parental supervision depends more on reports from young people about their activities, friends, and behavior. Parental supervision shifts from direct monitoring to trusting that young people will provide truthful reports of their commitments and activities—where they are going and who they are with. However, during adolescence, risk-taking and testing the limits are common ways of asserting independence. Away from direct parental supervision and exposed to myriad new enticements such as alcohol, drugs, and sex, the adolescent turns to more frequent lying to preserve autonomy and avoid parental disapproval and potential sanctions. Adolescents believe that, right or wrong, they have the right to make their own decisions, particularly in the areas of privacy, control over their bodies, and choice of friends.

Adolescents also lie to please their parents, teachers, peers, and siblings; to be loyal to their family and peers; for personal gain; to hide things they are ashamed of; to avoid punishment; to gain attention and status; and to feel more powerful and in control. Other motives for lying include rebelling against parents and other adults, conforming to peer expectations, as a challenge, to bond with and be accepted by their peers, to avoid punishment, and to gain a sense of control. Some adolescents realize that by lying or bragging they are able to manipulate their peers; increase their sense of self-worth; get attention, sympathy, and support; and feel more powerful.

In addition, adolescence is a difficult developmental period for many youth. Lying is sometimes seen as a way of coping with the stress of adolescence, a means of fitting in or belonging, a solution to being judged unfairly, and a way of feeling more adequate. In order to achieve one or more of these ends, adolescent lying often becomes more common and more complex.

There are also cultural differences in adolescent lying behavior. For example, in Eastern cultures, which tend to emphasize group loyalty, adolescents tend to lie to protect their peers. On the other hand, in Western cultures, which tend to emphasize the individual, adolescents are more likely to lie to protect themselves.

### Academic Dishonesty

Another common form of adolescent lying is academic dishonesty. Many adolescents have become very creative at finding ways to successfully cheat on school assignments and tests. Many adolescents copy the work of their peers, use crib sheets, use codes to communicate with peers during exams, and bribe their peers for test answers and/or pay them to complete their assignments. Some adolescents even break into teacher's classrooms and computers and steal exams and answer sheets.

Some creative adolescents roll up "cheat sheets" and slide them into the barrel of an empty pen, or write test notes on the back of a peeled-off water or pop bottle label, which they then replace and remove again during the exam. Others feign being ill and bring a box of "note marked" tissues to an exam, or take turns with friends staying home sick on exam day and then getting answers from others in the group.

Adolescents cheat in school for many reasons. They may cheat to deal with the tremendous pressure they perceive from their parents to meet high academic expectations. Many adolescents feel immense pressure from their parents to achieve at the highest level. Many parents offer their adolescent children rewards of money or the latest technology for superior grades. Adolescents may view these expectations as beyond their ability, which can create so much anxiety that adolescents tend to freeze up during exams or assignments. This pressure to achieve can also result in "cutthroat" competition in which winning at all costs becomes the norm.

Peer influence can also contribute to academic dishonesty during adolescence. In one study of adolescents recognized for high scholastic achievement, 80 percent stated that they cheated, and 95 percent of those who cheated considered themselves to be morally responsible. When asked, virtually all adolescents report that cheating is

*Two girls smoke pot during an outing in the woods near Leakey, Texas, May 1973. Dishonesty in adolescence is nothing new, and extensive child development research has shown that during adolescence, lying and deception tend to increase. Many studies have revealed that most adolescents lie to their parents about such things as when they started dating, their choices of movies and friends, their alcohol and drug use, and whether they rode in cars with drivers who were under the influence of alcohol or drugs.*

unacceptable. However, if adolescents know or perceive that most of their peers are cheating, they tend to do the same. Thus, peer cultures that reinforce cheating have developed in many schools.

There are additional factors other than parent and peer pressure and positive reinforcement that motivate dishonesty and lying related to academic issues. For example, low self-esteem can lead some adolescents to doubt themselves and their ability to perform well enough academically. Fear of failure can be strong when adolescents perceive that they are not achieving at the same high level as a “star” sibling, or that they may not qualify for admission into an elite university. Many college and university admission standards have risen, and scholarships have become more scarce. Thus, grade point average and class standing upon graduation have become even more important. Many adolescents see cheating as necessary to avoid shame or failure.

Another factor is the strong emphasis in Western culture on autonomy and individual achievement, the belief that to be worthwhile one has to be fiercely competitive and claw one’s way to the top. Thus, many adolescents have little difficulty blaming their academic dishonesty on pressure from parents, peers, and siblings; an overwhelming load of classes, assignments and exams; stringent college and university admission and scholarship requirements; and their own personal inadequacies.

### Consequences of Adolescent Lying

There are several long-term costs that adolescents pay for the short-term benefits of lying. Taking the easy way out can be expensive in the long run. Adolescent liars often become alienated and isolated from the friends and family members who they have deceived. Adolescents who lie damage the trust and intimacy with loved ones, often resulting in less frequent and less effective communication, which then leads to withholding of important experiences and often more lies.

Persistent adolescent lying may be a precursor of negative developmental outcomes such as delinquency, aggression, school failure, and bullying. In addition, as the frequency of an adolescent’s lying increases, their mental health may suffer. Persistent lying has been found to relate to psychological symptoms such as depression,

low self-esteem, debilitating guilt and shame, and even learning disabilities. There may also be undisclosed reasons for an adolescent to lie, which compounds the initial problem. For example, a youth with undiagnosed attention deficit disorder might lie about homework assignments and grades. A youth with low self-esteem may lie to bolster his status with peers. Adolescents sometimes lie to conceal poor emotional adjustment in order to avoid worrying parents or as a means of trying to handle their issues single handedly.

Some adolescents start believing their own lies and end up deceiving themselves. The lives of adolescent liars can become complicated when they try to keep track of the two versions of reality they must remember in order to avoid detection. Sooner or later, however, when their lies are detected, they often face double punishment, one for the behavior they lied about, and the second for the lying itself.

# Advertising, Consumer Products

Consumer products are the goods that people use every day, such as toothpaste, soap, paper towels, and hair products. The United States is considered to have the largest consumer goods market in the world; in 2009, this market was estimated at \$416 billion.

The Federal Trade Commission (FTC) has the authority to monitor and regulate companies that use deceptive practices to advertise consumer products. The FTC was established by the Federal Trade Commission Act in 1914 as a regulatory agency with the mandate to monitor organizations for antitrust violations; it was to be a “watch-dog” of companies, regulating their activities to ensure fair and ethical competition among businesses. The FTC asserted that its duties included protecting consumers from deceptive advertising. However, the U.S. Supreme Court in *FTC v. Raladam Co.* (1931) determined that the FTC could only enforce activities that limited competition among companies. Seven years later, the Wheeler-Lee Amendment adopted by Congress in 1938 expanded the role of the FTC to include more direct protection of consumers by monitoring deceptive advertising of consumer products.

The FTC’s authority to publicize rules and regulations regarding deceptive advertising was added in 1975 through the Magnuson-Moss Warranty-Federal Trade Commission Improvement Act. This act allowed the FTC to file civil lawsuits in federal court in order to hold companies responsible for failing to follow commission rules. Further, the FTC could protect consumers by filing civil actions on their behalf without first issuing a cease-and-desist order to advertisers accused of deceptive practices.

## FTC Definition of Deceptive Advertising

However, making a claim and proving that an advertisement is deceptive is difficult because of how the FTC defines a deceptive message. The FTC considers a message to be deceptive under two conditions. First, it must misinform consumers who are acting reasonably with regard to a product that is advertised. The FTC considers reasonability through the perspective of the

advertisement’s target group. Children, then, should be considered differently when looking at their response to advertising than adults looking at the same advertisement. Second, the information provided in the advertisement is evaluated to determine whether it is “material,” or critical, to the decision to purchase a product; a misleading material claim would be an advertisement that influenced consumers to purchase a product that they would not have otherwise purchased. A material claim includes information about the effectiveness, value, and features of a product.

Claims made in advertisements can be either “express” or “implied.” An implied claim could be that a mouthwash kills germs that can cause illnesses. The product does not prevent sickness, but it is implied that it does. An express claim is a statistic or piece of evidence that supports the purchase of a product, such as “four out of five doctors recommend product Z.” The FTC can hold companies responsible for providing questionable evidence and statistics in express claims, and can allege that advertisements are misleading in implied claims.

In 2012, the FTC challenged claims made by Oreck vacuum cleaners, Reebok shoes, and Nivea skin cream. Each one of these products’ advertisements included claims that could not be proven: Oreck maintained that its vacuum cleaners prevented the flu, Reebok advertised that some of its shoes could tone a consumer’s body, and Nivea claimed that one of its creams reduced the body size of consumers. The FTC also monitors online advertising and files suits against Internet marketers, such as those selling acai berry supplements and claiming that they were effective in helping consumers lose weight through the use of untrue testimonials on bogus news sites. For some of these claims, the FTC can order that consumers be refunded the money that they paid for products that were dishonestly advertised. The commission can also order companies to cease and desist the continuation of untrue claims, and can ask companies to create corrective advertisements that will clear up misunderstandings among consumers.

## Puffery

“Better ingredients, better pizza” was a claim by Papa John’s Pizza Inc. It may be an example of what is called “puffery,” or what the FTC

considers acceptable distortion of information in an advertisement. Puffery is an ambiguous statement that includes a positive proclamation regarding a product. Words such as “best,” “better,” “superior,” and “unsurpassed” are examples. An advertisement that uses puffery is not considered by the FTC to be deceptive because such claims are considered obvious exaggerations to reasonable consumers, and would not influence their intention to buy a product.

Puffery is one of the most researched areas regarding deception in advertising. Some research has shown that many consumers believe puffery, but other research has shown that it is not believed by most. These mixed findings may be because in some situations, puffery is more believable than in other situations. For example, when consumers have less knowledge about a product, puffery is considered more diagnostic or helpful in their purchasing decision. When consumers have more knowledge, they are less likely to be influenced by puffery. Further, when puffery is placed in advertisements published in a popular, mass-circulation magazine, it is less likely to be believed than when it is in an advertisement in a trade or professional magazine.

Consumers may also be savvy to tricks like puffery. Research has shown that consumers have some understanding that exaggeration occurs in ads, so that moderate levels of puffery in an advertisement are more effective than higher levels of puffery. At higher levels, the claims can become more far-fetched and unbelievable, and thus are easier to distinguish as deceptive.

To better understand how the levels of puffery influence the intent to buy, some researchers have looked at how levels of puffery followed by trials of a product influence evaluation of that product. Results from these studies have shown that moderate to relatively high levels of puffery followed by the trial of a product positively influenced consumers’ intent to buy. Conversely, at extremely high levels of puffery followed by a product trial, a negative effect was found. Consumers tended to be disappointed with the product when they had high expectations and the trial failed to realize those expectations.

Some research has looked at how two-sided arguments could be presented to consumers in order to counter this decreased intent to buy.

A two-sided argument includes the puffery or inflated positive claims about the product, as well as counterarguments downplaying problems with the product. These two-sided arguments with high levels of puffery, when compared to one-sided or only positive claims in advertisements, have been found to be effective in convincing consumers to not be disappointed when they try the product, and thus have a positive impact on intent to buy.

Still other research on puffery has looked at the interpersonal effect or the direct-to-consumer salesperson’s use of puffery. One study looked at this relationship and found that the more puffery a salesperson used, the lower the trust in that person and the lower the desire to purchase a product from him or her. It may be that, in person, consumers expect to receive more truth than deception, or that they already anticipate that they will be lied to, so trust is already low before talking to the salesperson.

### **Other Forms of Deceptive Advertising**

Puffery is not the only means by which an advertiser may try to mislead a consumer. Another method involves “masked marketing,” or advertising a product in a covert manner so that consumers may not know that they are receiving a message about the product. An example of this is product placement in movies or television shows. Another example includes the messages seen on computers when searching the Web, or messages sent via e-mails.

There is also subliminal advertising or heuristic advertising, which has received much attention. When this is used, consumers receive stimuli that predisposes them to rate a product more favorably, but they are not able to identify why. One powerful heuristic is color. Case studies have shown that 60 to 80 percent of a decision regarding a product is based solely on its color. For example, blue is associated with clean, so it is often used for packaging clothes-washing products. It is often believed that red is the color of choice if companies want to get a product noticed, but this can backfire. Contact lens solutions use greens or blues, soothing colors, for packaging. Using red on these packages as a dominant color would deter consumers from purchasing the product.

Types of claims made in advertising and how they can be deceptive has also received much

research. Up to 10 types of claims have been found that could be considered deceptive in advertisements. The two claims, however, that are believed to have the strongest impact on consumers' buying behaviors are the expansion implication and the inconspicuous qualification implication. The expansion implication is an untrue exaggeration such that a product is said to be able to perform at a level to which it cannot. The inconspicuous qualification implication should prevent deception from the expansion implication, but the qualification is hidden through the use of a small font or obscure placement on the page.

In one study, advertisements in the adult section of a Las Vegas tourist magazine were analyzed. Researchers investigated three types of claims: claims that did not have a referent, claims that can be argued to be true, and specific claims. When a referent was missing, the ad would state something like, "this is legal in Nevada," leaving the "this" to be interpreted by the tourist. Thus, this claim was considered deceptive in most of the advertisements in the magazine. Specific claims listed the times when the business was open or specific services, so they were not found to be deceptive in most of the advertisements. The arguable or debatable claims were found to be relatively deceptive because they were not always about the product offered and included statements like, "oral love is a beautiful thing," which could not be proven to be untrue or deceptive.

Other methods of manipulation or deception in advertising include flattery—telling consumers they deserve the product—without providing relevant facts about the product. An example would be a car commercial that emphasizes luxury or a smooth ride, but does not provide any explanation for what that means or how it compares to other cars.

### Research on Deceptive Advertising

Proving that an advertisement is deceptive has been found to be a challenge in research because cause and effect must be found; the ad must be shown to mislead a person to purchase a product that he or she may not have bought without being given the deceptive information. One way to determine causality that has been suggested is to include two control conditions: one with no information, and one with true information.

These can be compared to misleading or expanded claims in the experimental condition to determine if the misleading advertisement causes a higher level of intent to buy a product than the control conditions. When experiments have used these methods, their findings have indicated that when advertisements that inflate the product performance of a consumer product are made, the participants reported a higher level of intent to buy the product in the deceptive ads over the no-information or true advertisements.

The theory most often referred to with regard to deceptive advertising is Fishbein's theory of belief, attitude, intention, and behavior. As deceptive advertising manipulates beliefs and attitudes, it can also lead to altering intention to buy and then buying behavior. Fishbein's theory has also been applied to corrective advertising, but does not effectively work in understanding these types of ads. Advertisers are trying to be ineffective in promoting a corrective message, and corrective advertising may actually increase positive perceptions of the company, and thus may have a positive, not a negative impact on buying intentions and behavior.

Also, previous beliefs and attitudes about a company will influence perceptions of a corrective advertisement. These were incorporated in a variation of the Fishbein model in an effort to explain why corrective advertising may increase intention to buy and actual buying behavior. The proposed model was not summative, like Fishbein's extended model, but instead included causal effects and multiple paths to allow for numerous predictions of consumer behavior. The authors of the model contend that it will better explain the influence of corrective advertising. Other research on corrective advertising has shown that corrective advertising in print media has less influence than corrective advertising on television, with television corrective advertisements the most effective at correcting false information about a product.

Deception in advertising can also be seen in the type of media chosen. Infomercials, for example, have been considered deceptive because they take on the appearance of a talk show, with famous individuals casually talking with a "host" about their experiences with the product. Infomercials also often have commercial segments that further

lend to their credibility, yet the advertisements often further promote the product discussed on the infomercial. To seem less deceptive, the sponsor of the infomercial will disclose that it is paid advertising, but a consumer may miss this disclosure and still be deceived.

The type of magazine can also influence the perspective of the potential buyer. When puffery is used in advertisements in popular mass-circulation magazines, it may not be considered true, but when it is used in professional publications, it is more likely to be considered true or factual.

### **Advertising to Children**

In the case of television, there is much research on television advertising and its effect on children, particularly on childhood obesity. As children age, they watch more television, with an average of 2.2 hours a day at 1 year of age, and up to an average of six hours per day for children ages 8 to 10. Overall, through television, children between the ages of 2 and 11 are exposed to 5,500 food commercials a year. The majority of the food commercials aimed at children are for high-calorie or junk food. The food industry attempted to regulate its advertising practices by adopting the Children's Food and Beverage Advertising Initiative. However, even after a number of years, a report issued in 2009 found that three-fourths of food commercials aimed at children were for products that lacked nutritional value.

Although these commercials may or may not distort information provided to children, they may be considered deceptive under the FTC's definition of deception. If an advertisement would entice a reasonable person who would not otherwise have been enticed to purchase the said product, then it is deception. The FTC also takes into consideration the target market of the advertisement, so if children are the target, the commission can evaluate whether the child can tell the difference between the television show and the advertisement; if the child understands that he or she is receiving an advertisement, or that someone is making an effort to persuade him or her; and whether the child can understand puffery. Because children understand on a literal or physical level until about the age of 11 or 12, it may not be possible for them to comprehend that they are receiving an exaggerated message or even that they are being persuaded.

Another area where children can be deceived through advertising is the use of "advergames." Advergames are games on Web sites where products like cereal or toys are sold. As children see advertisement headers while they play these games, they may be persuaded to want to purchase the product. Some examples include Fisher-Price online games, where children can play alphabet games and find a tab leading to pictures and names of products that they may want to purchase. Another example is Chuck E. Cheese Pizza's Web site, where children can play "Chuck E-Games" and win free tickets to use when they go to Chuck E. Cheese with their parents.

This leads to one of the most dynamic and difficult-to-monitor mediums for advertisements: the Internet. The Internet is unique in that it is interactive; there are few entry barriers; advertisers can be anonymous (e.g., post reviews of their own product); it is easy to create a professional-looking advertisement on the Internet; it is easy to take the advertisement off the Internet; and there is a spatial or temporal separation, so information can be received at any time, night or day. One method of misleading consumers on the Internet is through the use of product recommendation agents (PRAs). PRAs enable searches based on product preferences and interests, and the results of the searches are predetermined so that certain products will come up as preferred more than others when they are not actually better products.

### **Consumer Bias and Self-Deception**

Consumers have also been found to have biases that predispose them to purchasing or preferring one product over another. They employ self-deception when making purchases. Advertisements and product placement (where a product is placed on a shelf or in a store) can manipulate these biases and encourage purchase of the advertiser's product. Some of these biases include: the halo effect, cognitive dissonance, primacy effect, and information distortion. The halo effect increases self-deception in that consumers tend to believe that a product that they already like has attributes that it may not have. An example would be to believe that a certain type of bleach, Bleach A, will not damage red clothing; yet, this attribute is not true and is a distortion because the

consumer likes the product and wants to believe that it is the best product available. Another self-deception that has generated much research is how individuals can experience dissonance over a purchase, particularly an expensive purchase, and then employ rationalization to make them feel better about the purchase.

There are also primacy effects that come from persuasion literature, and with regard to self-deception and product preference, in this type of distortion a consumer prefers the product they first chose and may distort new information to maintain this preference. An example would be if Bleach A was the preferred product, and a consumer is presented with evidence that Bleach A can damage red clothing; the consumer may distort this evidence so that they may believe that Bleach A will actually enhance the color of red clothing. Finally, information distortion primarily occurs in situations in which the consumer has only vague or ambiguous information, but still has a preference for one product. Consumers may search for confirming evidence through advertising to support their preference.

Some researchers have tried to determine how to reduce the self-deception that consumers employ because of biases. In these studies, researchers introduce diagnostic information, or accurate information demonstrating that one product is superior to another, to individuals who may purchase either brand. Diagnostic information may reduce distortions, leading an individual to choose the better brand; however, the consumer may then distort new information regarding their new preference. Such research shows that these self-deceptions may be powerful and are used as tools by advertisers to encourage product preference.

## African Americans

African Americans are descendants of Africans who have similar physical features, identify themselves culturally with those in the continent of Africa, and are citizens of the United States. African Americans have been victims of oppressive practices and dehumanizing treatment throughout the history of the United States. Historically, skin color and other phenotypic characteristics have been used to identify populations for oppression, violence, and unequal treatment. Africans who were captured and brought to the United States were readily recognizable because of skin color.

During the period when Africans were enslaved in the United States, they were not allowed to learn to read or write, thus facilitating lies that were used for mentally enslaving them, just as the institution of slavery physically enslaved them.

### Historical Deceptions: The Slave Trade

Among the many deceptions that were used to justify the enslavement of Africans is the lie that Africans did not have a culture and civilization in Africa prior to their capture. In reality, the people of west Africa, the origin of most enslaved Africans, had a rich and varied history and culture long before the arrival of European and other slavers. Geographically, west Africa protrudes into the Atlantic Ocean, providing ample sea transportation and merchant opportunities, as well as inland forests and tropical savannas that lie between the deserts and the ocean. The original inhabitants of this region were primarily

the present-day people of Hausa, Yoruba, Igbo, Mandingo, Fantin, and Ashanti. The earliest west Africans were skilled hunters and gatherers, who also had a wide variety of political arrangements including cities, states, kingdoms, and other organizations, each with individual languages and culture. Village life around 2500 B.C.E. grew into cities, eventually developing into empires and kingdoms.

The historic Songhai Empire and the kingdoms of Benin, Congo, and Mali were dominant, with monarchs leading complex political and social structures, and having governance capabilities over hundreds of thousands of subjects. Ghana was an ancient empire and a wealthy kingdom that supplied gold to north Africa and Europe between the 9th and 11th centuries. Africans were especially skilled in such subjects as medicine, mathematics, and astronomy. For centuries, west Africans traded with Europeans through merchants in north Africa. The Portuguese were the first traders to sail along the west African coast in the 15th century, and they were followed by the Dutch, British, French, and Scandinavians. Africans made fine luxury items in bronze and traded gold, ivory, spices, seeds, and tools from village to village, state to state, and continent to continent.

For several decades prior to the involvement of the Portuguese and Europeans in African exploration, the Arabs, including fierce Muslim zealots, waged religious wars against African villagers. The Muslim zealots captured many west Africans, hauling and dragging them across the Sahara Desert into Arabia. In the many years of war between the Arab Muslims and African Christians, the Africans were without modern weaponry. As a result, the empires and great kingdoms of west Africa fell to continuous Muslim attacks. Throughout this period of wars and conflicts, both Christians and Muslims captured and enslaved one another for religious reasons.

Another serious deception is that Africans sold their fellow Africans into slavery. In fact, Portuguese and European traders from their first contact kidnapped and bought African war captives from Muslim crusaders. Although war captives were viewed as slaves, during the Middle Ages, slaves in Africa had some rights and could not be abused, bought, or sold. They often had

the right to own property. While seeking gold and spreading Christianity for Portugal, Portuguese explorer Henry the Navigator in 1444 first explored the African coasts. He and his crew attacked and captured a sleeping African village and carried its people in chains against their will to Portugal. From then on, Portugal was heavily engaged in slave trafficking, transporting an average of 1,000 African slaves annually within a 10-year period.

The deception about the sale of Africans by other Africans originated to justify the human-rights abuses perpetrated against Africans. It was also used to deceive enslaved Africans into thinking that they were not wanted by their people, consequently causing distrust and division between slaves and the peoples of their homelands.

In the 17th century, transatlantic slaving became an imperious trade when plantation owners required increasingly more slave labor to meet the rising demand for sugar in Europe. The first group of Africans who arrived in the North American colonies, also referred to as the New World, were not slaves. Many arrived in the New World with European explorers long before the beginning of slavery. There are historical accounts noting that Vasco Núñez de Balboa's crew included 30 Africans in 1513, when he came upon Panama. Also, Africans were with Juan Ponce de León in Florida and Francisco Pizarro in Peru; Africans accompanied Hernán Cortés when he came to Mexico; and Africans were members of the crew engaged in French explorations of the New World, as well as Jesuit missionary expeditions into Canada. Africans also sailed with Christopher Columbus on his first, second, and third voyages to the New World. One year before the *Mayflower* landed at Plymouth Rock, 20 Africans had already come ashore in Jamestown, Virginia, in the summer of 1619. They joined the ranks of white indentured servants, because slavery did not exist in North America during this period.

Hundreds of Africans eventually came to the American colonies as indentured servants or free-men from England, Spain, Portugal, and the West Indies. As indentured servants, they were often freed from their labor obligations after a specified time of service, and were able to live legally as citizens, own property and opportunities for

education and advancement. They served alongside other Europeans who were also serving a term of indentured servitude. By contrast, the institution of slavery supported the denial of basic human rights and the extraction of human labor through physical and mental abuse. The institution of slavery brutalized and subjected African Americans to systematic violence and oppression.

The increasingly huge economic benefits from sugar plantations created a demand for more laborers. Plantation owners attempted to enslave North American Indians, but many Indians died of smallpox and other diseases transmitted by Europeans. Attempts to institutionally enslave white people failed because they could more easily escape and blend in with the larger white community. Africans were selected as an enslaved workforce because they were considered stronger than whites and Indians, could work in extreme heat for long hours without dying of heat exhaustion, and could not blend easily into the larger community if they ran away. Most important, Africa was seen to offer an inexhaustible supply of strong new laborers.

Within a few years, hundreds of thousands of slaves were crossing the Atlantic each year. Known as the Middle Passage, the voyage from Africa to the New World was one of massive, forced migration. It involved overcrowded ships, harsh conditions, disease, suicides by jumping overboard, and maimed hands and feet from the chains used to hold them. The two and a half centuries of slavery as an economic institution caused the displacement and death of over 100 million Africans, including those who died during the passage.

The involuntary removal of millions of Africans from their homeland and the horrific journey to America is one the most tragic events in the history of humankind. Slavery is considered the single most important historical event distinguishing the African American experience as uniquely distinct from any other racial and ethnic group. Additional deceptions arose in response to the dehumanizing effect of slavery, which laid the foundation for some racist theories that tended to falsely classify slaves as a subhuman species, physically and intellectually inferior to whites. This contradicted the earlier justification

*"Be On Your Guard Against All Lies" declares a broadside from the mid-1800s. The ad was meant to warn about the status of arrested fugitive slave Anthony Burns and the deceptive tactics of his kidnapper, who demanded more money after Boston citizens raised money to purchase the slave's freedom. Deception was rampant in all facets of the slave trade.*

for slavery based on the claim that Africans were stronger than whites and Indians.

Resistance to slavery continued, and by 1831, the power of the antislavery movement had intensified. African American slavery was an important factor in the U.S. Civil War, which began in 1861. On January 1, 1863, President Abraham Lincoln issued the Emancipation Proclamation, declaring that all slaves would be free. An estimated 5 to 20 million Africans were enslaved in the United States up to this time. With the passage of the Thirteenth Amendment, which was ratified

on December 6, 1865, slavery in the United States was officially abolished for approximately 4 million African Americans.

### Civil Rights

Reconstruction following the Civil War brought about three major pieces of legislation: the Fourteenth Amendment, providing due process in the protection of individual rights and liberties; the Fifteenth Amendment, allowing African American men the right to vote and hold political office; and the Civil Rights Act of 1875, which outlawed racial discrimination toward African Americans and proffered equal access to public facilities.

These new rights were interrupted as numerous white supremacy groups formed in opposition to the new status of African Americans. Terrorist and vigilante organizations such as the Ku Klux Klan and the Knights of the White Camellia engaged in a campaign of violence and intimidation against African Americans. In addition to lynchings, burnings, beatings, and the promotion of lawlessness by these racist organizations, southern legislators enacted the Black Codes of conduct in support of social oppression and the era of Jim Crow segregation. The conglomeration of American racist practices toward African Americans during and after slavery culminated in the stigmatization of their status. This stigma has persisted until the present.

From the 1950s and 1960s, with the Supreme Court decision in *Brown v. Board of Education*, African Americans have fought and endured institutional racism, discrimination, and oppression unlike any other group in the United States. They have persevered amid inhumane assaults and in the face of adversity. They have shown resilience for living through the eras of slavery, Jim Crow segregation, and racial terror. Through their struggles, they have made momentous contributions toward advancing the civil rights of all Americans and the quality of their lives against ponderous odds. Many perceive the election of President Barack Obama in 2008 and his reelection for a second term in 2012 as steps forward in U.S. race relations. Although many African Americans have become successful in various professions and careers, the struggle for equity on all levels continues.

Many African Americans remain victims of negative categorizations and evaluations on the basis of skin color. They are victims of stereotypes and prejudice that persist against them in American society.

## Alibi

An alibi is a defense used by accused persons to deny criminal or other charges by asserting they were somewhere else at the time of the offense. As a verb, the term applies to the act of providing that defense. The word is of Latin origin; it is a combination of *alius* meaning “other” and *ubi* meaning “where.”

Alibi literally means “other where.” An alibi is the claim of the suspect to be innocent of the charge because he or she was somewhere else at the time of the crime, and thus could not have committed the crime. In a nonlegal context, alibi simply means an excuse or a defense against any sort of charge.

The connotation of the term *alibi* is slightly negative, whether in a legal or popular context. The act of providing an excuse that is labeled an alibi has a shade of disrepute about it, as though it is a poor form of proof, but is the best available to the accused. The popular presumption is that relying on an alibi is a dubious or at least unsavory action. This distaste may be rooted in the fact that, by asserting an alibi, the accused does not claim that their character or values would preclude committing the offense in question. Instead, the accused argues from defeasibility, saying, “I could not have done it.” So the alibi is offered in a mechanical way; it claims “I was unable to commit this crime.” That stance is much less noble than the assertion, “I would not have done that.” This claim says, “I am not the sort of person who does things like that, whether or not I was somewhere else at the time of the crime.” So, this stance is an assertion about who one is, rather than where one is. By raising an alibi defense, an accused person makes no mention of a defense based on character. This position means that if the prosecutor can puncture the alibi, the accused remains under consideration for the charges. In fact, showing an alibi to be false confirms that the accused is at the very least a liar, and is perhaps guilty of the initial charge.

Unlike other explanations, an alibi defense is one of innocence. Some jurisdictions require that defense attorneys disclose their intention to offer an alibi defense prior to trial to allow prosecutors time to investigate. This requirement is unusual because under normal circumstances in a criminal trial, the defense has no obligation to reveal anything prior to trial. An alibi defense is not a frivolous undertaking; if proven to be false, the alibi may subject the defendant to charges of perjury or obstruction of justice.

### Famous Alibis

In the annals of true crime, the 1882 case of Armand Peltzer of Antwerp, Belgium, stands out for presenting a perfect alibi. Pelzer was in love with another man’s wife, and wanted to do away with him so that his wife and Pelzer could marry. He enlisted his brother Leon, who owed him a large debt, to commit the murder. Leon was to come to Europe from America and kill the husband for Pelzer. Leon assumed the identity of Henry Vaughan, a wealthy magnate looking to

build a shipping line. Leon was also required to completely change his appearance and spend time and money becoming well known in several major cities. He then contacted the husband, a lawyer, about representing the fictional shipping line. When the lawyer came to Brussels, Leon took him to his room and shot him in the back of the head with a noiseless pistol. Then, both Henry Vaughan and Leon Peltzer disappeared. Pelzer, who had set all these plans in motion, was in another city; he had constructed an untraceable perfect murder and the perfect alibi.

In a similar vein, the notorious gangster Al Capone never sanctioned a murder without having an ironclad alibi in place. In his most famous crime, the 1929 St. Valentine's Day Massacre, he made it a point to be in Florida when seven of his competitors were gunned down in a Chicago garage. His murder protocol was succinct, and it was said that "the operations were quick and complete and Capone always had an alibi."

Alibis also work to protect the innocent. In 2008, two brothers from the Bronx were charged with murder in a drug-related shooting. Their defense attorney asked the New York City Transit Authority to trace the movements of one of the accused on the night in question in pursuit of an alibi. The investigation of his transit card records showed that on that night he had used both a bus and the subway, and was five miles away when the shooting happened. News accounts noted, "The man's lawyers produced his MetroCard, saying it showed that he was innocent." Federal prosecutors dropped the murder charges. The alibi was effective in promoting justice.

The concept of alibi has shown up in popular culture, including the poetry of T. S. Eliot. In his 1939 collection of poems *Old Possum's Book of Practical Cats*, he includes a poem, "Macavity—The Mystery Cat." Eliot writes of this wily feline: "He always has an alibi, and one or two to spare/ And whatever time the deed took place—MACAVITY WASN'T THERE!"

### Alibi Agency

In recent years, a new service has arisen: the alibi agency. The first of these organizations opened in Japan in the 1990s; they moved to Europe in 2004, and can now be found in the United States. Their function is straightforward: these agencies

provide cover stories for a fee. One service maintains a two-tier fee structure: Many services are priced from \$75 and up, including support that allows a client to "pretend you are anywhere." At the \$175 range, customers can purchase more refined products, such as a fabricated physician's note. Alibi Network, an American agency, conveys the breadth of services it provides on its Web site: "Whether you are interested in a doctor's excuse not to skip work, a virtual seminar to hide your discreet affair or need us to place a discreet phone call on your behalf, we'll provide the support you are looking for." Politicians have spin doctors, corporations have public relations specialists, and now "regular people" have Alibi Network.

## Anderson, Anna (Anastasia)

Anna Anderson (1896–1984) spent a lifetime claiming to be Grand Duchess Anastasia Romanova, youngest daughter of Czar Nicholas II, the last emperor of Russia. During the night of July 16 and 17, 1918, Nicholas and the entire imperial family (the czarina, their five children, and four servants) were murdered by Bolshevik

insurgents in the basement of the Ipat'ev House in Yekaterinburg. Anastasia was 17 years old. Eyewitnesses claimed that none of the Romanovs could have survived the assassination, one of the defining moments of the civil war ensuing in the bloody wake of the Russian Revolution. However, a woman calling herself Anna Tschaikovsky (later Anna Anderson) emerged in Berlin in 1922 with the remarkable claim that she had escaped the massacre, and was in fact the daughter of Nicholas II.

Reactions were mixed. Many interested parties, including exiled Romanovs who had known the girl, and Anastasia's childhood tutor, denied her claims and responded incredulously. The czarina's brother initiated a private investigation, and the woman's real identity was the subject of numerous lawsuits over many years. A smaller number supported her story. One of Anastasia's childhood friends, the son of the czar's doctor, was an ardent supporter of Anderson's claims. Although her champions were always in the minority, their unrelenting advocacy ensured that the story continued to attract attention and controversy until her death in 1984.

Anderson's life was spent in Germany, and subsequently the United States, where she was supported by friends and sympathizers and remained the focus of intense speculation concerning her identity. Much of this time was spent in sanatoria or psychiatric facilities, although after her marriage to the historian Jack Manahan in 1968, she led a relatively peaceful domestic existence in Virginia.

Evidence to support her claims had always been scant, exclusively relying on her testimony and that of a coterie of well-wishers who refused to believe that she could be lying or deluded. As early as 1927, the investigation funded by Anastasia's uncle (the czarina's brother) determined that Anderson was in all likelihood a Polish woman named Franziska Schanzkowska, who suffered from mental problems prior to 1920. Nonetheless, her claim proved extraordinarily resilient. Amid a fog of argument and counterargument, authors Anthony Summers and Tom Mangold published *The File on the Tsar* in 1976, arguing that Anderson was not lying when she claimed to be the grand duchess. Others, for their own reasons, seemed keen to uphold her claims, although

the evidence against them steadily accumulated as the years passed.

### Forensic Evidence

There was considerable interest in definitively proving Anderson's story either false or true. Without forensic, rather than anecdotal or circumstantial evidence, the question remained open. The major breakthrough came in 1991, when researchers uncovered a mass grave at the end of a former dirt track in the forest 12 miles from Yekaterinburg. This location matched the account of the burial of the bodies later supplied by Yakov Yurovsky, who had led the assassination squad in 1918. Skeletal and dental records, facial reconstruction, and other forensic work indicated a strong possibility that the remains were those of members of the imperial family. The following year, DNA tests proved that the bodies were those of the czar, the czarina, three of their daughters, and the small domestic retinue who had been with them at the last. Exactly which of the royal daughters they were, however, could not be ascertained at that time. Furthermore, two sets of remains belonging to the imperial couple's other children, Grand Duke Alexei and one of his sisters, were not found at the site, as might have been expected.

Speculation was reignited. A number of studies, such as an investigation by James Lovell, maintained against increasingly lengthening odds that Anna Anderson was who she had claimed to be. In 2007, however, the remains of two more bodies were discovered in another forest grave close to Yekaterinburg, again conforming to statements made by Yurovsky, who had asserted that two of the victims had been separately buried. In 2008, forensic experts finally confirmed the result of mitochondrial DNA tests: the bodies were those of Alexei and a sister—either Grand Duchess Maria or Anastasia. All members of the immediate royal family now were accounted for. Samples of DNA taken from Anna Anderson during her lifetime (following a hospital operation) did not show any match with the Romanov family. Definitive evidence had at last been supplied to disprove Anderson's claim and lay her story to rest once and for all.

Anna Anderson was only one of a number of pretenders to imperial Romanov status.

Numerous claimants came forward after 1918 to identify themselves as one or another of the apparent victims of the Yekaterinburg massacre, their stories gathering varying degrees of interest. None, however, proved as enduring as that of Anna Anderson.

The alluring ingredients of her miraculous survival story, and the narratives of hope and possibility that they provoked among those who wished—and wish even now—to believe, were ultimately no defense against forensic procedures, which still lay decades in the future when her story was first presented to the world.

## **Animals**

Deception implies free will; in order to lie and to deceive, there must be a resolve, as well as a keen awareness of the choice between good and evil.

Furthermore, deception has a negative charge, and involves a choice.

These notions become problematic when it comes to animals because the general agreement is that animals are driven by their natural instincts; in other words, they are beyond good and evil. However, scientific and empirical observation have proven that many animals are in fact champions of deception, so much so that the human observer would be tempted to anthropomorphize an animal by lending it a will to pretend and deceive. Along with examples of animal adeptness at deception, there have been attempts to determine if in fact animals have a will, or if this aptitude is instinctual and natural—just another means for survival.

#### **Animal Examples of Deception**

In 1862, the English naturalist Henry W. Bates published in the *Transactions of the Linnean Society* the results of the research that he had conducted on butterflies from the forests of Brazil. According to German scientist Wolfgang Wickler, the conclusions drawn by Bates stimulated heated discussion for the next 100 years, not only among scientists but also among philosophers, theologians, and teachers. The reason for such interest was that Bates had in fact pointed out a particular phenomenon that would later receive the term *Batesian mimicry* in his honor. Having observed that the palatable Pierid butterflies pretended to be the unpalatable Heliconids, Bates came to the conclusion that animals could act a part. Wickler notes, “An actor is a mime, and so the representation of a false warning pattern was called mimicry.”

In another attempt to classify the varying degrees of deception, scholar Robert Mitchell proposes a hierarchy describing subsumptive levels of deception, and lists six levels of increasing complexity creating different forms of deception. While the first level involves evolution, selection, morphogenesis, and registration by the victim, the second level calls for registration of the deceiver coordinated with actions of the victim. The third level, call for learning and memory, with the fourth calling for pretense, conscious thought, and imaginative planning. More complex, the fifth level takes the other's perspective, and the sixth level recognizes the other's perspective on the self's perspective.

Several different forms and levels of complexity of deception are practiced by animals. These levels may distinguish simpler processes from more complex quasihuman behavioral patterns. The problem with this distinction is that the adjective *simple* runs the risk of diminishing the fact that any mimetic or deceptive analogy involves the origin of all species and all adaptation.

### Insects

Insects are exemplary of the first two levels of deception, although some performances on the part of insects, such as pretending to be something they are not, could very well fall under the third level of deception. Butterfly deception would fall under Mitchell's first two levels because they implicate camouflage and mimicry, but these first two levels differ when it comes to the involvement of the agent. As Mitchell states, "At the first level are simulations, produced through selection, evolution, and morphogenesis, which were selected for their resemblance, from the victim's perspective, to things that have special relevance (mimicry) to no relevance (camouflage) to the victim."

Examples of butterfly deception other than Bates's can be found in butterflies with wings that look like a head and antennae, and butterflies that have, as naturalist Adolf Portmann points out, independent patterns on forewings and hindwings that produce a deceptive symmetrical pattern. Portmann also describes the peacock butterfly, which not only disguises itself, but also performs a display on a sunny stone, as it "displays its glorious wings—it is an exhibitionist. On another occasion, when it is flying toward a wall . . . the same butterfly will suddenly fold its wings; as if by magic the colorful peacock disappears, and in its place we find a leaf." An illustration in Portmann's book, *Animal Camouflage* (1959), also shows the leaf imitation of a south American butterfly (*Draconia rusina*) with "damaged" wings and skeletonized leaf effects.

Yet another example of butterfly deception can be found in the Kallima butterfly of India. The caterpillar stage looks like the cruciferous plant on which the egg was laid: hairy green coat, fine black dots, and white lengthwise stripes. The Kallima's pupa, in turn, resembles the flower's maturing pods, and once the butterfly emerges, it displays colorful tricks either in flight or at rest.

Portmann notes, "Now, the male's conspicuousness is no quirk of nature—its markings are characteristic of all the Pieridae, a world-wide family of butterflies."

Similar to the phenomena observable in butterflies, the hindwings of the hawk moth have a frontal margin that is the color of bark, and this margin alone is exposed when the moth is at rest. These are concealing patterns that turn the attention away from the moth's contours by breaking up its outline. Because there appears to be coordination between the deceiver and the deceived, this deception would fall under Mitchell's second level of deception.

Examples of deception are innumerable in the insect world. Wickler lists insects that look like wasps and enjoy the same protection. Wickler also points out that the larvae of the praying mantis looks just like an extremely unpalatable larva of a predatory bug that is avoided by insectivores, whereas the adult mantis closely resembles a flower. Finally, Wickler demonstrates the similarities between the unpalatable leaf beetles and lady-birds, which are often mistaken for roaches that happen to be palatable to insectivores. Other insects that practice mimicry include the acid-spraying bombardier beetle that is imitated by the cricket, and the tiger beetle that is imitated by the grasshopper. The North American darkling beetle stands on its head when disturbed, and sprays a defensive secretion that is mimicked by a very similar beetle (*Megasida*) that assumes the same posture, but contains no defensive secretion.

There are also numerous ant mimics in the insect world. According to Wickler, the concept of ant mimicry is long-established because so many insects and spiders not only look like ants, but also behave like them as well, especially considering the similarity in size, color, body structure, and behavior. In an attempt to explain what effect such a resemblance could have, some naturalists have gone so far as to argue that this phenomenon is mimesis, rather than mimicry. Such a notion fits well in this approach to the animal world in terms of deception because *mimesis* is a Greek word used to denote imitation in the classical theater. In other words, the actor is viewed as mime, a pretender.

Yet another question concerns which animal is affected by the resemblance. While some insects

rely on deception by sight, either mimicking the ant's color or body structure with a false stem (the waist that joins the abdomen and the thorax) that is created by shading, other insects adopt the ant's behavior. For example, because ants have six legs and spiders have eight, many spiders run with only six legs.

Other examples of ant mimicry include tactile mimicry, in which a mime may resemble an ant by touch in the darkness of an ant's nest, and aggressive mimicry, where the ant guest simply enters the nest and devours its hosts.

### Snakes

There are countless symbolic values applied to the serpent. From the Greek *erpein*, meaning "to crawl," the serpent has come to symbolize malice, danger, damnation, pure negativity, and unworthiness, deception, and anything with a negative prefix, including Satan. A serpent lied to Eve in the Garden of Eden, and what ensued from this lie was paradise lost. A great deal of natural snake behavior lends credence to these images; for example, some snakes even produce a particularly elaborate death-feigning display, "wriggling about uncontrollably and ending with their mouth open and their tongue hanging out," as Mitchell notes.

Both poisonous and nonpoisonous snakes are argued to engage in deception. Quite a number of snakes found in the Americas have earned the title of coral snake, but they are not all poisonous; in fact, the venom of these snakes may range from deadly to nonexistent. There are both true and false coral snakes, and according to Wickler, their conspicuous color pattern represents a warning device in the case of the dangerous or true coral snakes. Consequently, there is the notion that false coral snakes are mimics or deceivers. There has, however, been debate as to which snakes are in fact the mimics, as it is possible that the dangerous or true coral snakes are in fact deceivers pretending to be harmless.

In 1956, herpetologist Robert Mertens observed both true and false coral snakes in the field, classified the various color and ring patterns, and came to the following findings:

- The coral pattern is found in 75 species belonging to 18 genera, all living

in tropical and subtropical zones of the Americas.

- Coral snakes belong to two separate families, the poisonous Elapidae and the nonpoisonous Colubridae.
- Mimicry is the likeliest explanation for these similar color patterns: While the pattern is advantageous to poisonous species as a warning effect, the harmless snake can enjoy the same protection.
- Any attempt to explain the color pattern in terms of ancestry, kinship, or environment is doomed to failure.
- The less poisonous mimics could very well be the actual models because snakes have a whole range of enemies.
- There is no evidence that snake predators can recognize a true coral snake innately—that is, without prior experience, because there is no way to gain experience from a deadly snake.

With these findings, Mertens questioned the function of the color pattern and determined that predators could only learn from experience from snakes producing a mild poison. Therefore, the moderately poisonous species are the true protective agents, and both the nonpoisonous and deadly snakes are the mimics or deceivers. Mertensian mimicry is thus defined as a form of mimicry in which the most offensive species is not the model, but is rather the mimic of a less offensive species. The serpent as deceiver can be either deadly, or harmless.

### Fish

Portmann avers that the greatest masters of disguise, by far, are fishes. Fish are capable of rapid color changes that allow them to not only adapt to their background, but also show sexual excitement, aggression, or submission. Portmann adds that chromatophore responses in fish are very complex. Wickler describes the many flatfish, such as plaice and sole, that are extremely adaptable when it comes to their coloration. Such an environmental adaptation of coloration can serve these fish both as predators and as prey.

Spots are yet another example of fish deception. Some ichthyologists believe that the small spots on the flanks of some coral fish are intended

to resemble bubbles, which help camouflage the animals in the clouds of bubbles produced by breakers on the reefs.

Other round spots on fish can resemble eyes. For example, the “eye spots” of the sunfish are used as threats, but according to Wickler, it remains to be seen whether some fish actually mimic the eye of a distinct species, and not just an eye in general. In any case, Mitchell deems some eye spots to be striking examples of second-level deception. “When these animals are attacked, they expose or make salient parts of their body which resemble eyes, thereby scaring the attacker,” he notes. “The eye spots are only revealed when the animal detects a predator or is otherwise disturbed. Sometimes this second-level deception is coordinated with first-level camouflage to avoid predation.”

There also species of fish that are almost indistinguishable from the “cleaner fish” that scour the surface of most well-known fish species, even large predatory fish. However, there are cleaning mimics that bite chunks out of their customers instead of scouring them. These mimics are almost indistinguishable from the true cleaners, and even mimic their behavior up until the moment that their subjects place their trust in them. Portmann also describes adaptive behavior common to many marine fishes that resemble seaweed and certain types of freshwater fish that float like dead leaves. It would appear that these fish are pretending to be something that they are not.

### Birds

Birds can deceive with spectacular plumage, humble disguise, or noise reproduction. Portmann

*An adult female chimpanzee plays with two babies at the Gombe Stream National Park in Tanzania, July 23, 2010. At Gombe, Jane Goodall observed chimpanzees acting out nonsocial pretenses, such as a young chimpanzee imitating her mother's ant fishing with an imaginary nest of ants. This prompted Goodall to question if the act was really pretense, or just imagination. Scholar Robert Mitchell questions whether there is any compelling evidence to distinguish among pretense, hallucination, and ritualization among animals.*

notes that although the distinction between brightness and drabness is often sexual, the roles are reversed for birds such as shorebirds, especially when the inconspicuous father sits on the eggs. There is also a variety of birds that is extremely adept at blending into their background. The beautiful plumage of nightjars, for example, is emphasized when they are held against a light background. However, when in their breeding grounds, the nightjars' markings merge into the environment, transforming them into branches, pebbles, and odd shadows. The ability to hold still is also an essential part of camouflage, and such a skill could very well be an inherited characteristic.

Similarly, the frogmouths from Sumatra blend into their environment with a combination of bark-like colors, patches, and dotted feather tips. In this case, a broken-up pattern deceives both predators and prey alike.

Yet, birds are not only masters of deception because of their plumage. Somewhere along the evolutionary process, birds began to produce noises in order to deceive other animals in their environment (their own species included). Birds can even mimic human speech, which makes observation all the more difficult because the observer runs the risk of attributing human traits and perhaps even emotions to the birds under observation.

Bird behavior, especially when it comes to the reproduction of sounds, could very well fall under the category of third-level deception, which involves learning and memory. Mitchell writes that if the *beau geste* hypothesis put forth by John Krebs in the 1970s is correct, birds that are genetically programmed to imitate the diverse repertoires of numerous avian species do so "because their expanded repertoires suggest what appears to be a crowded environment to other birds, who are thereby dissuaded from nesting nearby." Mitchell notes that while the influence of selection on learning propensities can be seen, selection can also produce organisms with learning that is much more open to environmental influences.

In other words, Mitchell is suggesting that the deceptive intention in some birds could very well be of the order of third-level deception, or learned deception, that goes beyond mimicry

and camouflage. Although the third-order deceptions require more intention and intelligence than the first two levels of deception, there is a broad spectrum of learned deceptions, from less sophisticated to more sophisticated, from functional deception to intentional deception, and all the deceptions in between.

## Mammals

Wickler writes that examples of mimicry are least common among vertebrates; he cites the unpalatable tree shrews as the most conspicuous case of mimicry in mammals. These shrews are so often mimicked by members of the palatable squirrel species that skins from the two groups cannot be distinguished without the skulls.

But mammals are more often observed practicing more sophisticated or more seemingly voluntary forms of deception. Dogs and chimpanzees are excellent examples of mammals performing at these more sophisticated levels. Primatologist Jane Goodall observed that after having gotten attention because of an injury, some chimps went so far as to feign an injury for more attention. Charles Darwin earlier noted that dogs displayed a sense of humor with sticks and objects thrown to them. A dog will carry an object away and wait until his master comes close enough to take it, then run away with the object, but stay close enough to lure the master back again before repeating the entire maneuver. In this case, dogs appear capable of deceiving their masters into believing that they will actually surrender the object.

With such numerous examples of animal deception, Mitchell asks if one must remain skeptical of any implication of planning on the part of an animal, and subsequently suggests that an animal that plans should also evidence some pretense of others' actions "because planning has an imaginal component which is concomitant with pretense of others: both involve kinesthetic-visual matching." In other words, an animal pretending to be another animal must know its own actions, and here lies the fourth level of deception: pretense and planning.

Thus far, the only nonhumans observed to engage in pretense are the rhesus monkeys and chimpanzees. At Gombe Stream National Park, Tanzania, Goodall observed chimpanzees

enacting nonsocial pretenses. For example, one chimpanzee imitated her mother's ant fishing with an imaginary nest of ants. Mitchell adds that other chimps that have interacted with humans display a surprising similarity with human pretense, citing the example of a home-raised chimp that pretended to have a pull toy; other chimps and orangutans played with dolls, and attributed psychological qualities to them.

Such behavior as the chimp imitating her mother's ant fishing prompted Goodall to ask rhetorical questions such as: How do we know that her twig was not swarming with a record, though nonexistent, catch? According to Mitchell, Goodall's questions suggest that an answer is unknowable, and in turn, asks about animals engaging in play fighting (if they imagine that they are fictionally really fighting), as well as if there is any compelling evidence to distinguish among pretense, hallucination, and ritualization.

## Anthropology, Cultural

Cultural anthropologists have studied deception around the world and have found that they exist in virtually all human societies in varying degrees of frequency and concern. Deception is actually a fundamental human capacity, found even in non-human primates, and societies struggle to strike a balance between it and the desire to be good, trustworthy, and honest. It is understood that in some cultures what might be regarded as lying and deception may be necessary and even desirable forms of social interaction.

Anthropology is the study of people. Archaeology, linguistics, physical anthropology, and cultural anthropology are the four major subdisciplines of anthropology. Cultural anthropology, which is sometimes referred to as social anthropology, studies variation within cultures.

### Ethnographies and Lying

One of the primary research approaches of a cultural anthropologist is to construct a detailed ethnography, which is an intensive description of a particular group of people at a particular place and time. This is usually achieved by means of an extensive period of fieldwork as a participant observer. It has been suggested by some cultural anthropologists that an ethnographic study is only possible to conduct by means of self-deception and partial truths and, in fact, it has been asserted that ethnographers must lie to complete their research.

Cultural anthropologists do not automatically assume that informants are lying during an ethnographic interview but, on the other hand, it is recognized that their perceptions and ideals may not, in fact, correspond to the actual realities of their everyday life. It is accepted that deception is not necessarily intentional, or even if it is,

that it may not be regarded as negative, and may well conform to their cultural norms.

Nevertheless, signs of deception have been identified by cultural anthropologists. These include body language signals such as avoiding eye contact, wringing of the hands, and lightly touching the face. Talking more than one usually would is another common sign of avoidance and lying. Informants selectively may also screen out information that they believe to be extraneous or embarrassing. Other areas of information may be regarded as secret, and discussion of these subjects may be restricted to select individuals within a culture. These are some of the factors related to deception that cultural anthropologists must consider in constructing an ethnographic report.

### **Lying in Cultures: Functions and Strategies**

Lying and deception can serve varied functions in respective cultures. For instance, in societies in which people live close together, there may be few actual secrets. However, cultural anthropologists have found that individuals can maintain a sense of personal integrity and privacy by means of the use of information, rather than physical space. In such contexts, deception can create ambiguity and, thus, also social distance, making the interactions of daily social life possible. Lying and deception can also be used to reveal deeper truths. For example, Raute pastoralists use rhyming proverbs (*uklan*) to both entertain and mislead as a form of accepted verbal evasion in order to deceive Nepali agriculturalists as to their true intent thereby establishing a social space to conduct their nomadic practices.

Lying can also be a rational strategy for resisting an oppressive social environment. This phenomenon has been found by cultural anthropologists in studies of patients institutionalized for substantial periods of time in psychiatric hospitals, where lying can be used to compete for attention from staff and to cope with disillusionment when there appears to be little to no hope of a cure. Lying can also be employed to ascertain the truth of a matter, such as when an individual pretended to be a devout disciple of a traveling sheikh who claimed to possess supernatural insights, but was thereby revealed to be a fake. Lies can also be seen as a legitimate

strategy to defend the interests of a kin group or other association.

Different taxonomies of lying and deception have been constructed by cultural anthropologists. For example, three types of deception based on the level of the deceiver's awareness of the deception and the subject of the deceiver's action have been identified. These include ordinary deception, in which the conscious intention is to deceive others or, at least, to hide information from others. There is also an involuntary or unconscious deception that involves a certain level of self-deception. Finally, there is illusion that involves complete self-deception, even in the absence of another individual. Similarly, there can be various types of lies about thoughts, feelings, or actions.

In some cultures, cultural anthropologists have found distinctive traditions in which lying and deception is the norm. In many east Asian cultures, for example, deceptive communication serves as a useful vehicle for the maintenance and preservation of social relationships. Cultural beliefs about deception are often reflected in folklore and local sayings. Many Native Americans in the southwestern United States, for instance, have traditions of the Trickster as a hero in their folk stories. Trickster figures, like Ananse, are similarly common in many African folklore traditions as well. Tricksters are inventive heroes in many oral traditions around the world, even though they may appear as clownish fools; their skills at trickery and deceit allow them to successfully negotiate challenges, and they are culturally respected.

Further, norms for behavior so dramatically vary that behaviors stereotypical of lying and deception also vary across cultures. For example, Jordanians consider blushing, negative statements, speech hesitations, and self-references as indicative of deception. Linguistic differences also contribute to this cross-cultural variability. It has been postulated that cross-cultural differences in lying and deception reflect differing socialization customs.

In some cultures, particularly many in the Mediterranean region, honor-status traditions can reinforce the likelihood that deception will be seen as socially acceptable if done in the service of honor. A high degree of misrepresentation and

defamation have been identified in these cultures in association with these customs.

### **Deception Research in Cultural Anthropology**

One cultural anthropologist studied the role of deception on the part of patients and psychiatric care workers in Greece, particularly with respect to the construction of a specific psychiatric disorder. In this study, some Greek mental health patients were found to use deception in order to acquire prescription drugs and/or government assistance for disorders that they did not actually have. There was a process of negotiation noted between the patients and the psychiatric care providers in making a diagnosis for a particular disorder. Symptoms to focus on, and those to ignore, were part of this negotiation process. Operating under the dynamics of suspicion, bias such as racism and other forms of discrimination was evident on the part of the providers, particularly if the patient was not a member of the predominant Greek Orthodox faith. In the context of national psychiatric reform in Greece, these suspicions of deception created pervasive problems with respect to ethical relations between patients and psychiatric care providers.

Another cultural anthropologist studied the nuances of truth and deception in China, and noted a propensity for deception in public interactions. The Chinese beliefs concerning deception are different from those of Americans, who hold to a tenet of absolute truthfulness. The Chinese use a different moral standard, and are more concerned with the consequences of lying and deception. These values have a longstanding tradition in Chinese society.

The interactions between patients and folk healers in the Caribbean have been examined as a lying game by another cultural anthropologist. From this perspective, both the patients and the healers operate within the culturally constructed limits of credibility. In clinical encounters, neither the incoherence nor the contradictions within the illness narratives of the patients, nor the apparent unrealistic if not outright whimsical prescriptions from the healers are questioned or denounced. Both parties must accept the accounts and opinions of the others for the therapeutic relationship to function within this

cultural context. Lying is accepted and understood as an instrumental way to bring certain truths to light and to enable clinical interpretations of the situation, even if it is at the expense of others. The patients and healers can blame a third party for placing a curse against the ill individual; the perpetrators of this witchcraft can be blamed, rather than the patients having to accept responsibility for their actions. It is most important for the patient and the folk healer to appear to fully comply with each other's discourse, rather than seek some objective truth. There is also a communal dimension to this interaction, as the lying game between the patient and healer works because other members of the community have had experiences with this form of health practice, and their recognition of its efficacy lends it greater credibility and legitimacy. The magical beliefs of the therapeutic potency of these supernatural practices are part of the cultural heritage of contemporary Creole societies in the Caribbean.

### **Anthropological Perspective of Deception**

Cultural anthropology reminds individuals that they should set aside their cultural values about lying and deception. These strategies can be appreciated for the distinctive roles they play in respective cultures. Cultural anthropologists justifiably do not endeavor to separate the truth from lies in the narratives of their informants. Truth is better understood in this sense to be a strategic cultural construction, as opposed to an empirically established fact. Under the precept of cultural relativism, cultural anthropologists intentionally avoid making any value judgments or moralizing, but rather attempt to gain an understanding from the intersubjective construction of reality. In cultural encounters, actors consciously and unconsciously integrate truths and lies to produce a dynamic truth that unfolds. Communication, accordingly, is a dynamic process best understood as a culturally constructed phenomenon in which deception can be incorporated.

Finally, cultural anthropology asserts that deception cannot be understood in isolation from other aspects of the cultural practices of a particular people. This is in accord with cultural anthropology's holistic perspective. There can be a social and moral good to deceptive behaviors that serve

to protect the interests of the members of a cultural group.

## April Fool's Day

April Fool's Day is an informally recognized holiday celebrated each year on the first day of April. The day is characterized by pranks, hoaxes, and/or practical jokes. The celebration of April Fool's Day can be traced as far back as the 14th century. Although it is not a nationally established holiday anywhere in the world, April Fool's Day is currently observed by numerous countries spanning six continents.

The origin of April Fool's Day is a mystery. The holiday is often attributed to a misinterpreted line

from the "Nun's Priest's Tale," one of *The Canterbury Tales* written by English poet Geoffrey Chaucer. First composed in 1392, "Nun's Priest's Tale" is a cautionary fable of hubris and flattery in which a vain rooster by the name of Chauntecleer is deceived by a predatory fox. Because of a copying error, early readers interpreted the poem's 375th line to mean "March 32," or April 1. Modern scholars, however, believe the story's actual setting was May 2, the anniversary of King Richard II's engagement to Anne of Bohemia. Additional scholars point to the 16th-century poets Eloy d'Amerval and Eduard de Dene as the first recorded mentioning of April Fool's Day. In 1508, d'Amerval wrote of a *poisson d'avril*, meaning "April fool/fish." In 1539, Dene wrote of an aristocrat who sent his servants on fool's errands on April 1.

Another prominent theory for the origin of April Fool's Day involves the reinstatement of January 1 as New Year's Day. Until the late 1500s, France celebrated the beginning of its new year on March 25, which marked the Archangel Gabriel's visit to the Virgin Mary. In 1564, France reorganized its calendar by moving the start of the year from March 25 to January 1. Other countries throughout Europe followed suit, although some waited until the 18th century to do so. Thus, those who chose not to adopt France's calendar change and continued to celebrate New Year's Day during the week between March 25th and April 1 had jokes played on them. Tricksters would secretly paste paper fish onto their backs, hence the term *poisson d'avril*. Critics of this theory point to its failure to explain the aforementioned references to April Fool's Day by 16th-century poets d'Amerval and Dene, whose writings date as early as 1508.

### April Fool's Day Celebrations

Regardless of its origin, April Fool's Day had become a well-established custom throughout much of Europe by the late 1700s. In 1686, English antiquarian John Aubrey referred to April 1 as "Fool's holy day" in one of his works, *Remains of Gentilism and Judaism*. During the 17th and 18th centuries, the "Washing of the Lions" was also a popular prank in London, England. The joke involved inviting unsuspecting citizens to view an annual washing-of-the-lions ceremony

within the Tower of London. Victims were told that they could watch lions being washed in the tower's moat, yet in actuality, there was no annual lion-washing ceremony. The first record of this prank dates back to the April 2, 1698, edition of *Dawks's News-Letter*, making it the earliest documented example of an April Fool's Day joke.

Today, April Fool's Day is celebrated around the world. Although the specific customs vary by region, the relationship between practical jokes and the first day of April is well established in Australia, Belgium, Brazil, Canada, Denmark, France, Germany, Iran, Ireland, Italy, Japan, the Netherlands, New Zealand, Russia, South Africa, South Korea, Sweden, Switzerland, the United Kingdom, and the United States. Portions of Canada, France, and Switzerland continue the April Fool's Day tradition of placing paper fish on the backs of unsuspecting victims. In Belgium, it is customary for children to lock their parents out of the house, only to let them in once they have agreed to bring the children treats. In Iran, people play jokes on one another on April 1 or 2, which corresponds with the 13th day of the Persian New Year. In Scotland, April Fool's Day is traditionally called Hunt-the-Gowk Day, and in Poland the public devotion to April Fool's Day is so strong that most serious endeavors are avoided altogether. The anti-Turkish alliance that Poland signed with Leopold I on April 1, 1683, was even backdated to March 31, in order to avoid association with the first of April.

Finally, a number of countries today celebrate a day of pranks on a date other than April 1. Countries throughout Central and South America, as well as Spain and Portugal, have a tradition of tricking others on December 28. Similarly, Denmark and Sweden have a traditional joking day on May 1. Although they do not occur on April 1, each of the customs observed in these places has comparisons to the traditions of April Fool's Day.

In conclusion, April Fool's Day is celebrated each year on the first of April, and is distinguished by people playing pranks, hoaxes, and/or practical jokes on one another. Although mention of the holiday can be traced as far back as the 14th century, its origins remain veiled in mystery. Throughout the world today, April Fool's Day

continues to grow in popularity, as evidenced by its celebration on six continents.

## Aquinas, Thomas

In "Question 110: Secunda Secundae Partis" of his magnum opus, the *Summa Theologica*, medieval philosopher and theologian St. Thomas Aquinas (c.1225–74) discusses lying with the kind of definitional precision and logical rigor that one expects from a Scholastic scholar. Aquinas argues that all lies by definition oppose the truth. He claims that they do so materially because what is conveyed is false in some essential way: formally, in that it is the desire of a liar's will to convey this falsehood to another; and effectively, to the extent that the liar is successful in causing another to believe true what the liar thinks is false.

Aquinas acknowledges that lies need not be verbal. The manipulation of signs with the intention to deceive constitutes lying, even in the

absence of words. Planting forensic evidence to incriminate an innocent person or hiding evidence of guilt are examples of such nonverbal manipulation. In Aquinas's view, the intention of the liar to deceive is an important component of the sin of lying. For this reason, a liar's conveying an objective truth in such a way as to create a false impression, and thus deceive another, is still defined as a lie by Aquinas. As he explains, while such communication might materially and accidentally be connected to the truth, in its intent and its effect, it remains formally and essentially a falsehood, and is therefore a lie.

As a contemporary example of this view, a student tells her mother that she stayed at The Library (a bar near campus) until 2:00 A.M. While factually true, the absence of any mention that The Library is a bar leaves the mother with a false impression of the way that her daughter spent the evening. Conversely, if a person conveys something that is objectively false, wrongly thinking it true, then he or she is not guilty of lying. Such is the case, for example, when a person reports that the solar system has nine planets, unaware that the count is now eight because scientists demoted Pluto to dwarf planet status in 2006.

According to Aquinas, all lies fall into one of three categories: officious, jocose, and mischievous. Officious lies are instrumental means of accomplishing some goal; jocose lies are told with the intent of entertaining; and mischievous lies, have as their object harm directed toward another. As a moral theologian, Aquinas is adamant that lying is always sinful. However, he is pragmatic enough to recognize that there are circumstances when it might be deemed necessary to lie in order to promote some positive good or avoid a greater evil. While Aquinas holds that lies told for such reasons are still sinful, he admits that the demands of difficult circumstances mitigate, though they do not totally negate, the sinfulness of the act.

He uses biblical examples to illustrate this point: Abraham referring to his wife Sarah as his sister while in Egypt, Jacob deceiving his father into giving him his older brother's birthright, the midwives of Egypt lying to the Pharaoh in order to save Jewish males, and Judith deceptively gaining the trust of Holofernes so that she can slay him and save her people. Like all lies, these are

*Carlo Crivelli's 1476 panel of medieval philosopher and theologian Thomas Aquinas, made for the high altar of San Domenico in Ascoli Piceno in Italy, depicts the saint with a sun on his chest (a symbol of sacred learning) and holding a book and a church. Aquinas asserted that all lies by definition oppose the truth, and they do so formally, materially, and effectively.*

sinful violations of God's law, despite the positive consequences that resulted from them. They are wrong, as Aquinas explains, in much the same way that it is wrong to steal, even if one's intention is to give the ill-gotten money and goods to charity.

Similarly, Aquinas argued, good intentions—such as the desire to make a bland narrative more interesting through the use of a jocular lie—also diminish, but do not eliminate a lie's sinfulness. In contrast, when the intention of the liar is to harm another, as is the case with any mischievous lie, the severity of the sin is rendered all the greater.

Aquinas does not insist that it is always imperative to tell the truth; rather, he admits that keeping silent about the truth, when prudently necessary to do so, is a lawful evasion.

### Why His Teachings Still Matter Today

What Aquinas taught centuries ago still matters today. Among medieval theologians, none has continued to exercise greater influence within and outside the Catholic Church than Aquinas. As a theologian, Aquinas demonstrated intimate familiarity with the Judeo-Christian scriptures and church tradition. He did not, however, limit the scope of his intellectual inquiry to these sanctioned sources. His work reflects an intimate and encyclopedic knowledge of both Christian and non-Christian intellectual traditions. He cites ancient Greek philosophers, especially Aristotle; Jewish rabbis, most notably Maimonides (Mosheh ben Maimon); and such Muslim scholars as Averroes (Ibn Rushd) and Avicenna (Ibn Sina) with the same easy familiarity as the Bible and the church fathers. His extensive use of Aristotle in particular, who he cited so often that Aquinas routinely referred to him as simply “the Philosopher,” was highly controversial during his lifetime; but in the end, Aquinas succeeded in “baptizing” Aristotelian logic, rendering it an acceptable theological tool in explaining the Catholic faith to believers and defending it against attacks from heretics, Muslims, and other external critics. This legitimization of Aristotle significantly influenced the subsequent development of philosophy, theology, and science in the Western world.

Initially, Aquinas’s bold and original synthesis of such diverse intellectual traditions was viewed with suspicion by many within the Catholic Church; so much so, in fact, that there was the serious possibility of his being charged with heresy. However, within decades of Aquinas’s death, Pope John XXII canonized him in 1323, officially recognizing him as a saint. In 1567, Pope Pius V declared Aquinas a doctor of the church, a rare and high honor, in recognition of his many and substantive contributions to the development of Catholic doctrine and theology.

In 1879, Pope Leo XIII issued an encyclical, “Aeterni Patris” (Eternal Father), in which he designated the Thomistic system as the official

philosophy and theology of the Catholic Church. In later encyclicals, the same pope pointed out the relevance of Thomistic thought in addressing various contemporary concerns. Pope Leo is credited with prompting renewed interest in Aquinas, whose thought then influenced such prominent 20th-century philosophers as Yves Congar, Etienne Gilson, Jacques Maritain, and Josef Pieper. Pope Benedict XVI, as well as his predecessor, Pope John Paul II, both pointed to Aquinas as an example of the complementarity of faith and reason.

Because of the high esteem in which the Catholic Church holds him as a saintly scholar, Aquinas is revered as a patron saint of students and universities, and has had numerous schools and colleges on several continents named after him. Aquinas’s contributions to philosophy and theology are included in the curricula of secular and religious schools, and he continues to be taught in the seminaries that prepare Catholic priests. However, Aquinas’s significance is not limited to the academic world. He is included in the “Paradiso” of Dante’s epic poem, *Divina Commedia*, and in Raphael’s Vatican stanza masterpiece, the fresco painting *La Disputa del Sacramento*. He is also referenced in contemporary popular culture artifacts as disparate as David Fincher’s cult classic film, *Se7en*, and Umberto Eco’s best-selling novel, *The Name of the Rose*.

## Aristotle

Aristotle arguably initiated the study of ethics with his examination of philosophical questions raised earlier by Socrates and Plato. In defining *ethos*, or character, Aristotle focused on individuals who possessed well-chosen habits of behavior that led to wellbeing and happiness. Deception, which adversely affects one's relationship with the surrounding world, interferes with the development of the habits required to achieve good and avoid evil. Aristotle greatly influenced Thomas Aquinas, a philosopher and theologian who is considered highly influential in the thought of the Catholic Church.

Aristotle was born in 384 B.C.E. on the Chalcidic peninsula of Macedonia. In or about 367, Aristotle joined the Academy of Plato in Athens, where he served as Plato's student and colleague. After Plato's death in 348, Aristotle left Athens, moving first to the northwestern coast of Anatolia, and later the island of Lesbos. Aristotle was involved in extensive scientific research, and he is considered a pioneer in the fields of zoology and marine biology. In 343, Aristotle was asked to serve as tutor to the 13-year-old son of Philip II of Macedonia, the future Alexander the Great. In 334, Aristotle returned to Athens, founding a school known as the Lyceum just beyond the city's boundaries.

At the Lyceum, Aristotle assembled a large library and continued his work, which built upon rather than repudiated that of his mentor Plato. Unlike the Academy of Plato, which served as a private club, the Lyceum made many of its lectures open to the public without charge. During this period of stewardship of the Lyceum, Aristotle wrote the majority of his surviving works, exploring ethics, metaphysics, physics, politics, and psychology. Although Aristotle's relationship with Alexander had considerably cooled over the years, upon Alexander's death in 323, Aristotle left Athens, because his Macedonian background caused many of the citizens there to be suspicious of his motives. Aristotle escaped to Chalcis, and died the following year.

### Truth and Deception

Aristotle explored concepts such as truth, lying, deception, and virtue in a variety of his works,

but especially in his discussions regarding the philosophy of mind, ethics, and science. Aristotle's work on the philosophy of the mind, which was expressed in his treatise *De anima* and a series of monographs, reflects his background as one interested in the sciences. Unlike Plato's conception of the soul, Aristotle believed that the soul had a relationship to an organic structure that could be found in flora and fauna in addition to humans. The soul is comprised of faculties, which have varying operations and objects. The varying operations and objects are what differentiate the various faculties. Thus, sight differs from hearing not because eyes are different than ears, but because colors are distinct from sounds. Aristotle identified certain inner senses, such as imagination and memory, which concerned the highest level of the soul, as occupied by mind and reason. Thought involves making judgments and concerns intellectual knowledge that involves universal truths, unlike sensations, which involve reactions. Lying, either to oneself or to others, thus interferes with intellectual knowledge because it impedes the making of judgments.

Aristotle's work on ethics also deals with these issues. The three surviving treatises written by Aristotle—*Nicomachean Ethics*, *Eudemian Ethics*, and *Magna Moralia*—examine moral philosophy and the roles of truth, lying, deception, and virtue. Aristotle maintained that a desire for final ends exists in nature, and this affects his approach to nature. For life to be worth living, it must be desirable for its own sake. The “good life” that individuals seek involves either the philosophical life, the political life, or the voluptuary life (i.e., the life focused on aesthetic, bodily, and intellectual pleasures). Happiness, which Aristotle uses to represent a state of wellbeing or flourishing, is an activity of the rational soul in harmony with virtue. Virtue can be either moral or intellectual in nature. Moral virtues include courage, temperance, and liberality, whereas intellectual virtues include wisdom and understanding. Wisdom that governs ethical behavior, and understanding that is expressed in scientific investigations and reflection are the two virtues concerned with truth.

As with the other Aristotelian virtues, wisdom is a subset of an individual's good qualities. Not innate, like hearing, wisdom is acquired which

practice. Moral virtue expresses itself in good purpose, and represents the individual's efforts to avoid excess and shortcomings in his or her daily actions. While lying is an action, it is not an action such as murder that must not be engaged in at all. Instead, one must balance the rightness and wrongness of lies by considering their possible consequences. Lying and deception are thus not necessarily always morally wrong, but instead must be examined in accordance with the outcome that results from statements that contain false statements.

Aristotle's interest in science also shaped his views regarding truth, lying, deception, and virtue. His interest covered most of the sciences, including biology, botany, physics, and zoology. Some of Aristotle's work in zoology remained unsurpassed until the 19th century, and his respect for the scientific process was strong. Aristotle's detailed observations of a wide variety of organisms include features that were not again observed until after the invention of the microscope in the 1600s. Understanding, one of his key virtues, is reflected in the care that Aristotle took in ensuring that his observations were accurately recorded. Aristotle posited that perfect happiness involved a combination of the pleasures of wisdom with the pleasures of understanding. To include deceptive statements in a report of a scientific investigation would be to compromise the value of that endeavor. As a result, Aristotle maintained adherence to truth in reporting his observations.

### Influence

Throughout the centuries, the study of Aristotle and his peers has often been analogous to receiving an education. From about 600 through 1100 C.E., the study of Aristotle was limited in western Europe, although he continued to be studied in the East. Aristotle markedly influenced Thomas Aquinas, who was first introduced to his work while a student at the University of Paris. As 13th-century scholars and leaders were facing the rapid transformation of their society, Aquinas sought to use Aristotelian philosophy to negotiate the chasm between traditional agrarian practices and scientific rationalism. Aquinas embraced Aristotle's belief in the primacy of intelligence, and came to view scientific advances as a means to

embrace truth. After Aquinas was ordained as a priest, he became an important theologian within the Catholic Church, and he was embroiled in a developing controversy regarding Aristotle's place in a Christian society. Aquinas worked to integrate Aristotle's philosophy into Christianity. After the Catholic Church adopted much of Aquinas's theological work, interest in Aristotle's work grew, fomenting a renaissance in the study of his writings. Later thinkers, such as Thomas Jefferson, Martin Heidegger, Friedrich Nietzsche, and others have also used Aristotelian thought to influence their work. Aristotle continues to be relevant in discussions related to a variety of issues facing individuals, organizations, and governments in the 21st century.

## Aroused Suspicion

Suspicion is the presence of doubt regarding the veracity of an individual's statement(s), and thus the sincerity of their motives behind their actions. It is an assessment of intent, in that when a receiver is suspicious, he or she will tend to believe that the other interactant in the conversation is purposefully altering information.

Suspicion has long been believed to have an influence on individuals' ability to accurately detect deception. Because arousing suspicion among research participants or receivers has been

shown to decrease the use of biases, such as the confirmation bias, and increase more systematic processing of messages, so, too, it has been believed that it should also increase an individual's ability to accurately detect deception.

### **Research on Aroused Suspicion**

Research on how suspicion affects accuracy has shown inconsistent effects; thus, not fulfilling expectations of increasing accuracy. Some research has supported a curvilinear effect, in which moderate increases in suspicion resulted in increases in detection accuracy, but low levels and high levels of suspicion resulted in decreases in detection accuracy. This research was conducted among romantically involved couples, yet linear relationships were found when this research was replicated with strangers. Among strangers, as suspicion increased from low- to medium- to high-manipulation levels, the lie accuracy rate steadily improved, whereas the truth accuracy rate gradually decreased.

These studies that found separate effects on truth and lie accuracy came after the discovery of the veracity effect. In other words, individuals are better at detecting truths than they are at detecting lies. However, by separating out truths and lies, it may be easier to determine the differential effect of suspicion on accuracy. Because it can thwart the truth bias, but not create a lie bias, the result would be an increase in accuracy in detecting lies and a subsequent reduction in the accuracy of detecting truths.

The way that suspicion has been induced may explain the mixed findings with regard to aroused suspicion and accuracy. Some researchers have used two levels of suspicion, low or high, or the presence or absence of suspicion. Other researchers have used three levels of suspicion: no suspicion, low level of suspicion, and a high level of suspicion. Research using three levels of suspicion has tended to show either the curvilinear or linear effects of suspicion on detection accuracy. Thus, when suspicion is induced at different levels, the picture of its potential influence on accuracy becomes clearer.

Further, suspicion may lead to increased confidence or an overconfidence in the ability to detect deception. In a study examining police officers, it was found that when police officers were highly

suspicious of a potential criminal, they then began to believe that their suspicion was a certainty. With increased certainty that an individual committed a crime, it may become more likely that accused individuals will enact false confessions.

Because of the relationship between suspicion and truth bias, much of the research on suspicion has focused on whether it can reduce the truth bias, or the tendency to believe that a message is truthful, even in the presence of information that shows the information to be false. This has been the most robust and consistent effect across aroused suspicion studies. In studies with strangers, friends, and romantic partners, increased aroused suspicion has led to a reduction of the truth bias.

The lie bias has also been found to be affected by increased suspicion. Research has demonstrated an influence of increased suspicion on encouraging a lie bias among receivers. When contextual cues are used to arouse suspicion, receivers can switch to being more lie biased. However, the affect on truth bias may be stronger than on lie bias.

### **Individual-Level Variables**

Individual-level variables have also been found to influence the effect of suspicion on accuracy. Experts on a topic area, for example, have been found to have reduced deception detection accuracy when suspicion is induced, but the same has not been found for novices on the same topic area.

Another individual level variable is generalized communicative suspicion (GCS). GCS is a trait variable and has been defined as an individual's predisposition to perceive another's communication as deceptive. In tests in which GCS and state, or experimentally induced, suspicion were both assessed for their potential to create a lie bias, individuals who were already highly suspicious (high level of GCS) and received a moderate induction of suspicion demonstrated a higher-than-average ability to accurately detect deception (70 percent detection accuracy). GCS has also been found to moderate the relationship between state suspicion and lie bias.

Finally, an affect for sex differences has been found such that women who had high levels of GCS had the strongest emotional reactions to discovered deception when compared to men who

had a high level of GCS. Tests of the GCS measure have demonstrated support for dimensionality, construct validity, and some support for predictive utility of the measure.

distinct category that typically only comprises a small percentage of participants within studies that do not specifically target this group. This makes it difficult to draw broad conclusions, but compiling findings from several smaller studies allows for conclusions to be made about Asian Americans and deceptive behavior.

In order to understand the cultural aspects that are associated with deception in the Asian American culture, it is first important to define who Asian Americans are as a cultural group. The 2010 U.S. Census data defines the category of Asian as any person with ancestors from the Far East, southeast Asia, or the Indian subcontinent. These countries include Cambodia, China, India, Japan, Korea, Malaysia, Pakistan, the Philippine Islands, Thailand, and Vietnam.

Lying and deception are almost universally considered unacceptable behaviors, yet members of most cultural groups consistently lie and engage in deceptive behaviors. The deceptive behaviors displayed by various cultural groups may be similar, but there appear to be some unique differences regarding why members of different cultural groups choose to use deceptive communication styles.

In Asian American communities, the collective cultural values that place group needs before individual needs affect how members of the community use deceptive communication styles, compared with individualistic communities that value individual needs over group needs. Some studies indicate that Asian Americans tend to use deception to maintain harmony in relations when truthful communication may result in strained relationships with others. Conversely, members of individualistic communities appear less likely to use deception to maintain significant social relationships. For example, a member of an Asian American culture may express less-than-truthful opinions with others to maintain positive relationships and ensure acceptance into a group. In the same situation, a member of a European American culture who values individualism may share his or her honest opinion with others without worrying about negative repercussions in order to make themselves stand out in a way that is unique. This type of collectivist or individualistic influence on communication may begin early in life.

## Asian Americans

The relevance of specific cultural variables related to deceptive behavior is an area that has received minimal attention in the literature. Most large studies of deception typically have a very limited representation of individuals from distinct cultural backgrounds. Asian Americans are one culturally

Some deceptive behaviors may be modeled early on in life, and become seen as effective methods for achieving certain desired outcomes. In studies of parental lying to children, researchers have examined differences in lying among different ethnic groups. Participants from different ethnic groups were asked to report if their parents had engaged in deceptive or lying behavior similar to that described in a scenario involving lying. Both Asian American participants and European American participants reported that their parents promoted honesty and truth-telling to them, but the Asian American participants indicated that their parents utilized lying more frequently than European American participants. The lying by parents of the Asian American participants was primarily targeted to promote compliant behavior from the children.

### Language and Cultural Identity

Language represents the vessel that holds the cultural, historical, and ecological experiences of a specific cultural group. In communicative language, emotional and nonverbal cues are language-specific. Researchers in the field of intercultural communication believe that children learn display rules, which are sets of subconscious emotional expressions. Later in life, humans rely on display rules to gauge the accuracy of emotional cues presented to them. Variation in interpretation of verbal and nonverbal behavioral cues is to a great degree included in language.

In certain studies, Chinese participants were asked to predict the deception patterns of hired actors speaking in their first language, and others speaking in their second language. The results indicated that participants identified truth-tellers more accurately in actors who spoke in their first language compared to those who spoke in their second language. Also, participants identified liars who spoke in their second language more accurately compared to their first language. Researchers believe that when lying in a second language, more emphasis is placed on facial expressions compared to lying in a first language. It is important to consider factors such as language and culture in judging the deception of second-language speakers.

Having a strong collective cultural identity may also influence the tendency to engage in deceptive

behaviors. Studies have shown that when compared to individuals with less collective cultural identities, people with strong collective cultural identities may have greater motivation to avoid telling the truth, in part to avoid unnecessary confrontations and social disagreements. Members of Asian cultures tend to use indirect communication styles in day-to-day communication to preserve relationships and avoid confrontation. Research has shown that when presented with hypothetical scenarios, participants who value relationships, as is common in Asian cultures, were more likely to use deception to benefit others. In comparison, when presented with the same hypothetical scenarios, participants who value individuality over relationships were more likely to use deception to benefit themselves.

Similarly, research has shown that being from an interdependent or an independent cultural background may impact a person's ability to detect lying in others. Participants from independent cultures appear more likely to rate responses that depart from the truth as highly deceptive, whereas participants who come from interdependent cultures tend to rate the same responses as not at all deceptive. The lenses through which participants view deceptive responses and make decisions about them may be greatly influenced by their cultural experiences. These lenses impact numerous aspects of life and work.

Studies that look at deception in business settings have revealed differences in deception tendencies across cultures. These differences appear to be highly influenced by either the existing collectivist culture or the individualistic culture with which the students are associated. For example, in a hypothetical business scenario that involved the potential use of bribery to ensure a successful business transaction, participants from collectivist cultures such as Hong Kong, Korea, or Japan were more likely to utilize bribery in the scenario than those from individualistic cultures such as Australia, the United States, and Germany.

Several cross-cultural differences have been noted from investigations examining the theory of reasoned action. This theory postulates that the likelihood that a person will engage in a behavior is determined by his or her attitude about the behavior, and how important normative groups view the behavior. A study focusing

on Koreans and Americans found several differences between these two groups regarding the reasoning behind their responses to a hypothetical lying scenario. First, Korean participants highlighted the importance of relationships over lying, whereas American participants emphasized the importance of telling the truth over preserving relationships. Second, American participants were less likely to use relationship-oriented excuses when explaining the reasons for lying for a friend. This phenomenon may be explained by the individualist nature of American society, compared to Korean society. Hence, these types of excuses are not considered acceptable. Third, Korean participants used normative reasons, which are related to perceived expectations of others, when explaining intentions of lying for a friend. On the other hand, American participants used normative reasons more strongly to explain intentions of telling the truth.

Both American and Korean participants' intentions were consistent with societal values common in collectivist cultures, compared to those common in individualist cultures. American participants were more likely to use societal expectations of honesty when explaining their intention to tell the truth, whereas Korean participants were more likely to use societal perceptions to explain their intention of lying for a friend. It is evident from the study that the influence of a collectivist society that values relationships over honesty in the intention of its members to participate in deception is greater than in members of an individualist society.

Reaction time is another variable that may provide some insight into lying and deceptive behaviors. Reaction time might involve measuring the speed at which a person detects lying, or it could include measuring how long it takes a person to contrive a lie. At least one study has indicated that east Asian Americans were more accurate in selecting correct statements than European Americans and Arab Americans, but they had a slower reaction time in making their selections than European Americans. The relationship between reaction time, deception, and culture appear to be in need of more extensive examination to determine what influences might exist.

Environment can also play a major role in influencing the behavior of a specific cultural

group. As part of human evolution, the survival of human beings depended on their ability to adapt to their environment. In one study, researchers examined reward and punishment behaviors associated with deception in east Asian Americans compared to European Americans. Both cultural groups were compared with east Asian participants residing in China. In the study, participants were given a hypothetical scenario in which they could lose or gain hypothetical money as a result of the deception or honesty condition presented in the scenario. Participants were asked to rate how likely they were to reward honesty and punish deception. Participants residing in the United States from both cultural groups (i.e., east Asian or European) were more likely to reward honest behavior than punish deception. On the other hand, east Asian participants residing in China were more likely to use punishment than reward.

In efforts to understand deception, cultural attributions, environmental factors, and language should be taken into consideration. When reviewed, several studies reflected significant trends in deception in Asian American culture versus European American culture, such as lying to preserve relationships and to maintain the group benefit over individual benefit. Understanding these trends can help strengthen the communication between the two cultures. To gain a better understanding, future research should focus on understanding differences in lying tendencies of Asian Americans versus Asians, and factors that influence lying tendencies.

## Assassin Bugs

The "assassin bug" is the common name for predatory insects belonging to the Reduviidae family. Assassin bugs actually encompass thousands of different species, including the wheel bug (*Arilus cristatus*), the leafhopper (*Zelus renardii*), and the spined assassin bug (*Sinea diadema*). Adult assassin bugs can grow to close to two inches in length, and can be identified by their grasping front legs and beaked heads. Assassin bugs feed on other insects, and can be found on every continent with the exception of Antarctica.

### Using Deception to Lure Prey

As immature nymphs, assassin bugs employ a unique type of deception to help lure unsuspecting insects closer. Their natural colors can range from brownish-gray to bright orange, making natural camouflage nearly impossible. Instead, nymphs attempt to obfuscate their appearance by covering themselves with the husks of their previous victims and bits of plant debris. Many of the species preyed upon by assassin bugs tend to investigate the heap of debris, significantly reducing prey capturing time and providing the nymph with a better opportunity to successfully attack.

The behavior of decorating one's exterior with foreign material is known as "masking," and its use as a feeding strategy has also been observed in spider crabs and in the larvae of the insect family Chrysopidae. One particular nymph, the dust bug (*Reduvius personatus*), masks itself with a layer of sand and dust particles in order to appear to its usual prey, the bed bug, as debris carried by the wind as the bed bug maneuvers for attack. Masking has limited value for preying on insects that have no visual capacity, such as termites and army ant workers.

An additional function of masking is as protection against visually hunting predators. Assassin bug nymphs are highly vulnerable to larger predators. Birds, geckos, rodents, and some species of arachnids are potential hunters of assassin bugs, but they have been observed failing to recognize the heap of organic material covering the assassin bug as anything edible. Predators that investigate the heap have been observed failing in their attack because of the "backpack" of debris ripping off the nymph's abdomen mid-encounter, much like a lizard's tail, allowing the nymph the opportunity to escape. Thus, the obfuscating behavior of masking can provide assassin bugs with both the opportunity to lure prey into its vicinity, and the possibility of becoming prey to other animals in turn. The particle-carrying capacity of nymphs decreases as the insect grows older and less vulnerable to predation.

Assassin bugs can commonly be found in vineyards, fruit orchards, cotton and soybean fields, and other vegetative habitats. Despite their appearance and behavior, they are generally considered beneficial to row crops because they are known to

*Reduvius personatus, or the masked hunter, is an insect belonging to the assassin bug (Reduviidae) family. The name refers to the fact that its nymph camouflages itself with dust.*

feed on harmful prey such as aphids, boll weevils, and caterpillars. Because of their quick adaptation to new environments and short life cycles, assassin bugs can be deployed as biocontrol agents meant to eradicate a harmful species.

However, assassin bugs are not finicky feeders, and they will often feed on more beneficial species. Their numbers can be reduced through common pesticides. Some assassin bugs will even bite humans, preferring to bite victims (who are often sleeping) beneath the nose and around the lips, thereby earning the moniker “kissing bugs.” Some people have reported allergic reactions to the saliva of certain types of assassin bugs. Assassin bugs found in tropical areas have been linked with Chagas disease, which can be fatal in humans.

## Attorneys

Attorneys in the U.S. legal system are often targets of jokes and scorn. Surveys of the U.S. population have shown that less than 20 percent rate attorneys as high in honesty (only slightly more than those who perceive car salesmen as honest). Media, films, and television often portray attorneys as unscrupulous, greedy, and even fraudulent. Such portrayals may reflect a fundamental misunderstanding of the roles and responsibilities of those who practice law. While attorneys in the various fields of law may engage in strategic misdirection and occasional omissions (unintended or otherwise), outright lies and deliberate deception are less common than popular stereotypes might suggest. The origin of the public perception of attorneys as dishonest may lie in misconceptions of the role that attorneys must play as advocates for their clients, the professional standards guiding their actions as advocates, and the ethical boundaries within which they are (and are not) expected to operate.

### Role of Advocate

The role of the attorney is to advocate, as skillfully as possible, for the best interests of a party. The party may be the state (as is the case for a prosecutor), a criminal defendant, parties to a lawsuit or family court dispute, or clients seeking representation in the formulation of contracts, wills, or other legally binding documents. The attorney is obligated to follow strict rules of ethics, evidence, and procedures, but enjoys great freedom in attempts to shape interpretations of evidence, rulings, or verdicts among judges and jurors: in other words, to “spin” the facts to their clients’ advantage. Strict prohibitions exist

against the presentation of false, fraudulent, or fabricated evidence. Nevertheless, through clever bargaining and strategies to shape reactions to the evidence, the attorney is free to attempt to lead the judge, jury, or opposing party to a more favorable (though possibly incorrect or unjust) result, such as exonerating a guilty party or inducing an unwitting opposing party to sign a plea, settlement agreement, waiver, or contract against his or her self-interest.

### **Standards for Truth in Evidence**

Rules of the courts and ethical standards of the profession are designed, as much as possible, to assure just and fair (correct) outcomes. In theory, this is best accomplished when decision makers, or those who enter into legally binding contracts, have the greatest amount of relevant and true information available before signing an agreement, making a ruling, or rendering a verdict. Toward this end, rules exist to control the truth and completeness of information presented in contracts or for use in litigation.

These rules prohibit the introduction of false information, whether represented in contracts; as objects and documents presented as physical evidence; in the form of written or oral statements, presentations, and pleadings of attorneys; or in testimony of witnesses. Specific rules within the American Bar Association (ABA) model rules of professional conduct address matters of deception in the presentation of arguments and evidence to the courts. Under Advocate Rule 3.3 (candor toward the tribunal), attorneys may not knowingly make false statements to the court, they must not fail to correct false statements made relevant to a case or proceeding, and they may not offer evidence (including witness testimony) that they know to be false. If a lawyer, their client, or a witness called by the lawyer offers material evidence that the lawyer later learns is false, the lawyer must take reasonable measures to disclose it to the court. A defense attorney may refuse to submit evidence (other than the criminal defendant's testimony) reasonably believed to be false. Attorney-client privilege may be relevant in these instances, but if a court order is issued by a judge, that privilege may be superseded.

Moreover, under Rule 4.1 (truthfulness in statements to others), when representing a client,

attorneys cannot knowingly make a false statement to a third person, and must disclose facts to a third person in order to prevent fraud or an illegal act, unless attorney-client privileges prohibit it.

### **Rules of Discovery**

Discovery rules are designed to ensure that all relevant evidence is available to the two sides of a dispute. This refers only to what the attorneys for each side must disclose to one another, not to what they are obligated to present to the judge or jury. The use of this information is then governed by rules of evidence defining what is or is not admissible evidence, and by each side's trial strategy.

In noncriminal (civil) litigation, discovery requirements are the same for both parties. In contrast, in criminal litigation, a discrepancy exists between disclosure requirements for prosecutors and defense attorneys. The defense attorney's duty is to protect the rights of, and achieve the best outcome for, the defendant. Moreover, the Constitution provides that defendants have a right to avoid self-incrimination. Therefore, the defense lawyer is not mandated to disclose potentially incriminating evidence to the prosecution, and instead is required to disclose only specific classes of evidence, such as an alleged alibi, a list of witnesses to be called, recorded interviews of witnesses, reports provided by expert witnesses, and other relevant documents not excluded under the right to avoid self-incrimination.

Both the duties and standards for discovery are different for prosecutors. ABA criminal justice standards relating to prosecution functions (Standard 3-1.2.c) impose the duty on prosecutors to seek justice, not merely to convict. In line with this goal, prosecutors are legally bound to provide all evidence to a defense attorney, whether such evidence suggests the guilt or innocence of the defendant (under ABA Advocate Rule 3.8: special responsibilities of a prosecutor).

Arguably, violations of discovery are among the most common deceptive practices of attorneys. Failures to disclose relevant and potentially damaging information are often virtually undetectable. Lacking the deterrent of reliable detection and exposure, attorneys sometimes cannot resist the temptation to strengthen their case by

suppressing or destroying damaging evidence. The true extent of the problem is unknowable, but complaints among attorneys frequently address failure of their adversaries to disclose important evidence. In criminal law, such complaints are most often directed against prosecutors, who are obligated to disclose exculpatory information favoring the defendant; no reciprocal obligation exists for defense attorneys to disclose incriminating information.

### **Strategic Obfuscation, Managed Interpretation, and Misdirection**

While violations of discovery and outright misrepresentation of the evidence through fabrication, destroying evidence, or suborning perjury are strictly forbidden, attorneys are free to enact a variety of strategies to misdirect one another, judges, and juries. They are free to try to affect reactions to the evidence (but not to falsify the evidence) in an effort to facilitate their clients' interests, even if the desired reactions might be considered wrong or unjust. Lawyering has much in common with military strategies of obfuscation and misdirection outlined in Sun Tzu's classic *The Art of War*, and with stage magicians' strategies of misdirection.

Analogous to the magician's "smoke and mirrors," strategies of obfuscation are often practiced in legal documents, in which attorneys may use legalese and ambiguous language, and which may be unnecessarily lengthy and extensive. As a result, signatories will neither read nor understand much of the document that they sign.

The largest armament of strategies is practiced by trial lawyers as they prepare and try their cases before juries. Before trial, attorneys commonly present selectively relevant case law to judges in support of pretrial motions in attempts to influence judges' interpretations and rulings. They engage in plea-bargaining or settlement negotiations (or contract negotiations) in which they routinely bluff. In the process, they may attempt to exaggerate the strength of evidence favoring their case, or the resolve and willingness of their clients to accept specific outcomes. They attempt to conceal or misrepresent their coming trial strategies to the opponent, hoping to leave opposing counsel unprepared and ineffective in countering this strategy.

Attorneys may also work with lay and expert witnesses to shape their testimony to be more effective. They coach their witnesses about how to engage the audience and the appropriate demeanor needed to sound more credible and persuasive. Such coaching might involve specific lessons about diction, body language, appropriate attire, and word choices aimed at increasing the witnesses' credibility or implicitly complementing the attorney's case.

Because the goal of trial strategy is to convince the jury of the merits of one's case, the first goal of the attorney at trial is to seat an unbiased jury, preferably a jury biased toward his side. Toward this end, a highly sophisticated art and science of jury selection has developed to guide attorneys' attempts to achieve a favorable jury. Some strategies are intended to affect which persons end up on the jury. Others use the process of questioning potential jurors to bias their thinking to favor one's client, even before opening statements begin.

Each attorney has the opportunity to challenge and remove from the jury, a specified number of jurors who seem most biased against his client. One cannot select favorable jurors, but in order to get such people on the jury, a number of strategies of misdirection are enacted to prevent the opponent from correctly identifying which jurors are most biased against his client, and to protect these jurors from challenge. Other misdirections are utilized to mislead the opponent to believe that jurors who are actually favorable toward his client are instead biased against him, all for the purpose of getting the opponent to challenge the wrong jurors. This gives the attorney who successfully uses such strategies more challenges than he is allotted, and a jury that is more biased in his favor.

These strategies are enacted during the process of questioning prospective jurors through careful choice of questions and of jurors who will be asked them. Such questions are also intended to favorably frame the issues of the case, begin to shape jurors' interpretations of the evidence to come, selectively reveal (and inoculate jurors against) the influence of unfavorable evidence, and generally bias jurors to view one's interpretation of the case favorably.

Once the jury is seated and trial begins, each attorney is free to selectively present evidence. No attorney is obligated to present the entire truth.

Instead, lawyers are obligated to present the best case for their clients, selectively presenting evidence that they feel will serve that purpose while avoiding presentation of false evidence. Their presentations do not need to be predicated on actual truth, as they may vigorously argue for a position that they do not consider correct or just, as when a defense attorney defends an almost certainly guilty suspect or corporation.

To persuasively present the case, the attorney will attempt to define and present the issues to his advantage, and will present a story of what happened that, if true, would lead to the desired verdict (e.g., self-defense versus premeditated murder). In the process, he will attempt to control jurors' attention so that they will focus on favorable and ignore unfavorable evidence; manage their interpretations of evidence through arguments, examinations of witnesses, and presentation of expert testimony; and manage reactions to himself and his clients. Such efforts to shape conclusions are permissible, even if they lead judges or jurors to unjust conclusions, as long as no false statements or evidence are knowingly offered.

### **Advocacy, Self-Deception, and Self-Justification**

The role of strong advocate for a specific position sets in motion motivations and cognitive biases, setting the stage for attorneys to unwittingly deceive themselves. "Confirmation biases" refer to tendencies to selectively notice and search for information confirming individuals' desires and expectations, and to bias interpretation of information toward consistency with them. Such biases can make it genuinely difficult to "see" the other side of a case, including recognizing the importance of evidence that others readily view as favoring the opponent. Such biases can sometimes account for what appears to be willful deception.

Once an attorney has vigorously pursued a case, it can be very difficult to admit errors. The desire to think of oneself as a competent and good person can lead the attorney to try to justify and defend his position, deceiving himself in the process. This need is arguably responsible, for example, for many documented cases in which prosecutors have failed to recognize or admit that a defendant is innocent, notwithstanding exoneration by DNA or other seemingly definitive evidence.

### **Legal Regulations**

Questionable, misleading strategies are used by civil and criminal attorneys, both inside and outside the courtroom. Attorneys can implement their tactics, implicitly or explicitly, by instructing or directing others, such as law firm staff, clients, family and friends of clients, private investigators, witnesses, expert witnesses, and other professionals or persons providing services to the attorneys or the clients. The acceptability and lawfulness of these strategies hinge upon whether they cross the line between attorney-client obligations and outright falsification of the truth.

Attorneys practicing in any area of law may encounter situations offering them the temptation to cross the boundaries of acceptable deception. The ABA Center for Professional Responsibility serves lawyers and judges by developing, promoting, and fostering standards of high ethical conduct and professionalism through leadership and guidance. The ABA model rules of professional conduct serve as models for the ethics rules of most states, with each state's bar association handling allegations of attorney misconduct.

Attorney misconduct is addressed in the model rules (maintaining the integrity of the profession, Rule 8.4: Misconduct). Professional misconduct can manifest as one of the following:

1. A violation or attempted violation of the model rules, or knowingly helping or inducing another attorney to violate or attempt to violate the rules
2. To violate or attempt to violate the rules through the actions of another person
3. Conduct to commit a crime that negatively affects the lawyer's honesty, trustworthiness, or fitness to practice law
4. To engage in conduct involving dishonesty, fraud, deceit, or misrepresentation

ABA Model Rule 8.3 (reporting professional misconduct) specifies that if a lawyer knows of another lawyer's violation of the model rules or knows of conduct that challenges that lawyer's integrity or trustworthiness, he must notify the appropriate professional authority, usually a judge (if during a case), or the state bar association.

Reporting an attorney does not include reporting any information that would otherwise be protected by attorney-client privilege.

### Ethical and Legal Consequences

Dishonesty among attorneys can have severe consequences for lawyers and their clients. Because an attorney is not permitted to be dishonest or to direct others to be dishonest, the attorney may be charged with such crimes as obstruction of justice or subornation of perjury and, based on the circumstances, the attorney may suffer suspension, fines, or perhaps even disbarment, expulsion from bar associations, and loss of the license to practice law. Those who were dishonest at the direction or behest of an attorney may also be charged with being an accessory to perjury, or with other crimes as determined by a judge.

Perhaps the more serious (and unjust) consequences are for the litigants whose outcomes are based on inaccurate, incomplete, or outright fraudulent evidence. They may suffer wrongful conviction, for example, when prosecutors have withheld exculpatory evidence. A seriously injured plaintiff may receive no compensation when corporate lawyers have participated in suppression of evidence of corporate responsibility for the injuries. A wealthy murderer might be acquitted when his attorney facilitates the perjury of a false alibi witness. These and many other wrongful results can occur when the evidence is false.

More broadly, public trust in attorneys and the legal system is eroded when dishonesty is exposed. The Professional Reform Initiative (PRI) of the National Conference of Bar Presidents has established a campaign to update the core values used to compare lawyers to other professionals. The PRI, a body of judges, lawyers, and nonlawyers concerned with the reputation of lawyers, seeks to influence the judiciary, the bar, disciplinary authorities, as well as law school and bar admission boards to assert and foster integrity, honesty, and truthfulness as the fundamental values of lawyers.

## Audience

The etymological root of the word *audience* can be found in the Latin verb *audere*, which means "to listen" and "to hear." The contemporary use of the word *audience* refers to a collective of people who may attend, witness, experience, and participate in a communicative event. There are several competing definitions of communication; still, no matter which meaning of communication is considered, "audience" represents its necessary condition of possibility, its ontological and epistemological foundation. Not surprisingly then, parallel to the noticeable conceptual development of communication in the last century, the idea of audience has become a powerful aspect of the communication metaphor, describing important aspects of social reality: an audience's activity as metaphor of people's political agency, an audience as the producer of public opinion, and an audience as creator and

manipulator of media content. Equally not surprising, if the notion of audience has been intimately connected with the idea of communication, and lying and deception are instances of it, then audience becomes a quintessential aspect of lying and deception as well.

Deception can take place and succeed only by assuming the presence of an audience; however, its significance may vary according to the way that the audience is conceptualized. An audience can be thought as a “particular” audience, the specific audience targeted by rhetoric and, therefore, the specific target of deceptive and manipulative attempts of persuasive communication. It may be treated as an “immediate” audience involved in face-to-face communication, or as a “mediated” audience, when the audience receives, consumes, or reads the message in a time and place different than that of the speaker.

Traditionally, mediated communication, because of both the physical and structural distance separating production and reception of messages, has been considered the most concerning level for deliberate lies and deception. The audience can be treated as “theoretical” or “imagined,” assumed to be present in any act of communication; an “audience of self-communicating”; and an “idealized” audience, such as the “universal” audience, composed of all demographics.

According to Jan Bordewijk and Ben Van Kaam, audiences can also be distinguished according to the different kind of medium of communication involved or through which they receive the information. The audience of transmission media, such as radio and television, has control over neither content production nor reception. Audiences of consultation media such as print, on the other hand, actively choose when to access the centrally provided content, and what content to access. Finally, the audience of conversational media relies on a communicative relationship characterized by the genuine, dialogical coproduction of meaning in which the roles of sender and recipient alternate.

### Deception and Audience Theories

In all kinds of communication, audiences may be the subject and object of deception and lies. However, whereas the variety of communicative

situations leads to differently conceptualize audiences, there seems to be a dominant frame to understand the relationship between lying and deception and the audience. In fact, in the tradition of audience studies, lying and deception have most frequently been associated with the political question of citizens’ agency and possible media effects on citizens.

In other words, assuming that (mediated) communication content is consistently shaped by particularistic, political, and economic interest, and is often translated into manipulative and deceptive communication, the capability of the audience to resist, criticize, and counteract such messages has traditionally been assimilated to the political power and civic sense of the *demos*. From this particular perspective, the debate on media influence on their audience has always been framed as a question whether democracy was deprived or empowered by modern means of communications.

The answer to those concerns varied throughout time. Traditionally, the audience has been considered to passively receive information, supinely driven by the force of the rhetorician, and therefore more exposed to deceptive communication. The metaphor of the hypodermic needle exemplifies how first audiences were understood by the behaviorist social scientific tradition and the social political and cultural context of the 1920s and 1930s. Just like a hypodermic needle, the mediate message could be injected under the skin of the recipient, the audience. Because the audience was sociologically understood as a homogenous entity, isolated, alienated, and vulnerable, it could be the object of deceptive communication such as propaganda, manipulation of advertising and public relations, or powerful rhetoric. Informed by such a perspective, mass media were considered a means of mass deception.

A reaction to the hypodermic needle came from a new paradigm that understood the role of an audience in making sense of the message in more articulated and active ways. The so-called limited defects tradition conceptualized the audience as concrete historic subjects who, because of their ideological, class, race, and gender positioning, could be more or less prone to receiving the intended message. Effects of communication had to be specifically qualified. Mediating, such as

subject position in time and place, level of attention, perception, and retention, were considered as decisive factors that could limit the effect, intensity, and duration of deceptive communication such as propaganda.

A theory that exemplifies such a new tendency is the two-step flow model, which describes how the mass-mediated message would, as a first step, reach active media users, the so-called opinion leaders. Then, if the message succeeded in passing these gatekeepers, the opinion leaders would spread the message to more dependent individuals (such as friends, colleagues, and family) in their immediate surroundings, the so-called opinion followers.

A step further in terms of the active meaning-making of an audience in receiving the message is respected by the uses-and-gratifications tradition, according to which the audience uses media for its own purpose and finds specific psychological and social gratification produced by those uses. Uses and gratification would not necessarily imply the overwhelming capability of the audience to detect or reject deceptive communication, but would argue that some deceptive aspects, such as myth, ideological positions, or what linguist Noam Chomsky defines as “necessary illusions” could be playing gratifying social functions.

Another seminal conceptualization of audiences has been provided by the encoding and decoding model provided by Stuart Hall. According to Hall, there are three basic ways in which the audience may relate to the intended (by the producer) meaning of a given message. In respect to intended hegemonic meaning encoded in the message, the audience could follow a dominant reading when conforming to the preferred meaning, it could follow an oppositional reading when it contested the ideological implications of the preferred meaning, and it could negotiate between the two extremes.

Ultimately, the capability of audiences to resist or comply with deceptive communication has always been considered a political act of complying or resisting rhetorical strategies of any kind of power.

## Authoritarian States

Defining a state as “authoritarian” is problematized by a number of competing definitions and typologies. However, at the core, classifying a state as such denotes that power and control within the state are unfairly concentrated, exercised, and maintained. Repression, whether political or physical, is utilized in order to safeguard the status quo and prevent political and social change.

As such, authoritarian states restrict or fail to maintain institutions and processes designed to foster and ensure the rights and political participation of their people. Therefore, the legitimacy of such states can be questioned because of a lack of accountability and direct input of the governed population.

Authoritarian states routinely practice deception at both domestic and international levels in the context of propaganda, self-interest, self-preservation, and repression of their people. Such deception can be used to foster nationalism and support for the regime through the caricaturing of other nations, with ethnic or cultural groups seen as threatening, thus uniting the population in common opposition. This is often done with the support of state-owned or state-influenced media. Deception can also be used to cover up human rights violations and atrocities, or scapegoat others once evidence of such acts emerge, thus distancing the regime from such acts.

Authoritarian states are often governed through autocratic rule, whereby an individual exercises total control and power. Libya, while under the iron rule of Colonel Muammar Gaddafi, is a good example of this. Gaddafi ruled by suppression and violence for decades before he was overthrown and killed as part of the Arab Spring events in 2011. However, as Barbara Geddes's typology (and other typologies) of authoritarian regimes demonstrates, authoritarian states can be governed through a range of leadership regimes, including military and single-party leadership, in addition to the personalization dictator model. Tunisia under Zine El Abidine Ben Ali is an example of the single-party type, whereas Algeria can be viewed as fitting the military type, in which unelected military and civilian personnel wield power and control. Authoritarian states can also exhibit a hybrid or amalgam of these models.

Such inequitable methods of governance can be contrasted with that of a democracy, in which greater accountability of leadership exists, and social and political rights of citizens are guaranteed and embedded by a range of institutions and processes. In authoritarian states in which some of these institutions and processes exist, they are influenced by the regime and ultimately serve to maintain the status quo and prevent political or social change.

### **Authoritarianism and Deception: Propaganda, Validation, and Denial**

Authoritarianism and deception go hand-in-hand. Aside from the dubious nature of how leaders come to power in authoritarian states, deception is wielded in the course of maintaining power and controlling the population. Deception is also crucial within the context of international power play, in which such states seek to exaggerate or invent their relative strengths, including military capabilities. The motivation for doing so often relates to a desire to intimidate and threaten external powers, as well as increase state interests in a competitive and conflict-heavy international environment, which can be viewed within the context of a realist perspective of international relations. Deception is also practiced in an attempt to dismiss or hide breaches of social, political, and human rights; to thus gain external legitimacy from actors such as the United Nations and strategic allies.

Propaganda is one key form of such deception, and is targeted at both domestic and international audiences. Such propaganda can be positive in playing up the relative strengths or achievements of the state, or negative in portraying external actors in an adverse manner. In the latter case, this often involves lying to the people of a country about the threats and intentions of external actors, therefore uniting people in populist support for the regime and in opposition to such common enemies. This can then direct attention away from the economic and social problems within the country.

Such deception can also serve to validate the authoritarian rule and policies that emerge from the regime. Modern history is littered with examples of this, such as Iran's anti-American position, with Iran caricaturing the United States as an anti-Islamist aggressor. Another example is China's continued dispute with Japan. Anti-Japanese sentiments, because of the troubled history between China and Japan, including Japanese atrocities in World War II, have served to scapegoat Japan for a range of contemporary problems in China. The anti-Japanese demonstrations in 2005 across Asia (mainly in China), and the recent territorial dispute over a chain of islands in the East China Sea, serve as examples of the ill feeling between the two nations. Ultimately, such tensions as those in Iran and China serve to galvanize nationalism

*The Victorious Fatherland Liberation War Museum in North Korea displays the authoritarian state's version of the Korean War, including this mural of the "Great Leader," Kim Il Sung, depicted as victorious. In reality, the war ended with the two sides signing a truce on July 27, 1953; a peace treaty was never negotiated. Even 60 years later, current North Korean leaders continued the deception; on July 2013, Supreme Leader Kim Jong Un oversaw a massive military "victory" celebration in the capital of Pyongyang. Such propaganda is a key form of authoritarian deception, which is targeted at both domestic and international audiences.*

and popular support for the regime and its policies. Nazi Germany and the Soviet Union can also be included in this context because strong nationalism and the perceived difference and threat of others were exaggerated and utilized for political gain with disastrous consequences.

Propaganda in relation to military achievement or prowess is also common in the context of authoritarian states. In addition to playing up strengths or embellishing the truth regarding military capabilities, this can include claims to possess advanced military technologies. For the most part, these claims must be treated with a grain of salt. Recently, Iran claimed to have developed and built stealth fighter jet capability. In early 2013, a televised unveiling of the

Qaher-313 fighter jet featured President Mahmoud Ahmadinejad imperiously inspecting the aircraft. Experts questioned the ability of the jet to fly, and a released image of the jet supposedly flying past snow-capped mountains caused embarrassment when analysis of the image showed that the image was altered by using Photoshop. Iran's attempt to create awe and intimidate through military prowess backfired.

Similarly, North Korea's efforts to propagate long-range missile technology and nuclear weapons have attracted both concern and skepticism from the international community. North Korea has a strong track record of seeking to deceive both its people and the wider international community.

Authoritarian states routinely lie to external actors and domestic populations to hide or deny complicity in human rights violations, torture, and even war crimes. The Syrian regime, under President Bashar al-Assad, has constantly denied claims by its civilians, s human rights watch groups, and foreign powers regarding its brutal and despotic rule. Such brutality is said to involve systematic torture, illegitimate imprisonment, murder, and even massacre. In addition to outright denial of the existence of such acts, another approach is to blame the actions on rebel or terrorist elements, often foreign, once the former approach becomes futile. Atrocities and wider human rights violations in places such as Syria have been documented by a range of independent reporting bodies, including Human Rights Watch. Televised news recordings of such events are usually met with state denials and the scapegoating of terrorist elements. The role of the media is important in both bringing awareness to state crimes, and in supporting the authoritarian regime.

### **Control of the Media**

Within authoritarian countries, core media outlets are often controlled or even owned by the governing regime, or at least run by close sympathizers of the regime. In Syria, for example, the media has been state-owned for decades, and in other authoritarian states, such as China, the freedom media is strongly monitored and curtailed, even though it has become increasingly commercialized in recent decades. Such states practice deception through hiding or denying civil and human rights breaches by restricting the media and information systems more widely.

In the context of China, the monitoring and blocking of Internet material is particularly noteworthy. This has led some commentators to describe this process as the Great Firewall of China. This works to restrict or prohibit access to Web sites deemed provocative, subversive, or embarrassing to the state and regime. Western-based news sites are among the sites blocked, as are those that discuss sensitive topics and those that question the legitimacy and human rights record of the state. A famous atrocity at China's Tiananmen Square in Beijing, where in June 1989 hundreds of prodemocracy protestors were killed by security forces, is

erased from the history annals through the blocking of content and discussion related to that event. The Internet material blocked by the Great Firewall of China also includes images, search terms, and social networking sites.

The censorship and control of media, combined with strict controls over the movement of their people, allows some authoritarian states to invent history, as well as erase it. For example, world events can be falsely reported to foster nationalism. A number of reports concerning this in North Korea have emerged, relating to events such as the Olympics and soccer's World Cup.

Despite the use of propaganda and iron-fist rule, there are many examples of people within authoritarian states rejecting the corruption and deception of the ruling regime, and rising up to oppose their governments. For example, the recent Arab Spring has involved both successful and suppressed revolutions in a number of Arab countries since 2010. In Egypt, Tunisia, and Libya, the regimes were overthrown, whereas in countries such as Syria and Bahrain, continued revolt has been put down. The method of put-down has often been brutal, with subsequent reprisals and further human rights violations. This is in keeping with other authoritarian regimes. For example, Robert Mugabe and his followers have brutalized opposition in Zimbabwe over a sustained period.

### **Nonauthoritarian State Deceptions**

State deceptions are not limited to just those states deemed to be authoritarian in nature. A number of recent examples clearly expose how Western democratic states have deceived both domestic and international audiences in the course of military and intelligence operations. The events associated with the West's War on Terror, for example, can be cited as proof of such high-level deception. Analysis has exposed dubious and even illegal practices by the United States and others in the course of fighting, occupying, and prisoner management in Iraq, which was initially covered up.

The very justification and legality of war have been questioned, with deception used to push through military action against Iraq in 2003. United Nations (UN) commentators, including Kofi Annan and Hans Blix, declared the war illegal, while the United Kingdom's government

utilized a flawed intelligence briefing document that outlined the threat posed by Saddam Hussein to justify action against his regime. The document, which became known as the “dodgy dossier,” made false claims about the threat of weapons of mass destruction. The threat posed by Saddam Hussein’s regime was greatly exaggerated to make the case for war. The document was subsequently described by commentators and journalists as having been “sexed up.” Deception has also been used in the cover up of dubious or illegal practices outside of the conflict zones, including illegal torture and “extraordinary rendition” of terrorist suspects. Once details of such practices were leaked and emerged in the press, they were met with strong condemnation. In addition, difficult questions have been raised about the legitimacy and accountability of military and wider security operations.

Authoritarianism and deception go hand-in-hand. States that are governed by autocratic or similarly repressive mechanisms employ deception in the course of their propaganda, self-interest, self-preservation, and repression of their people. This deception can be targeted at both

domestic and external audiences, but the most worrying aspect of this relates to the covering up of human rights violations, violence, and even atrocities. Human rights watch groups and international bodies such as the UN are crucial in raising awareness of this and affecting change.

## Bailey, Frederick George

Frederick George Bailey is a British anthropologist, author, and academic born in 1924. Bailey taught at a number of American and British universities during the course of his academic career, and is currently a professor emeritus in the Anthropology Department at the University of California, San Diego. Bailey is a prolific writer who has authored texts covering a wide variety of topics. While perhaps best known for his work regarding formal and informal political systems and political processes, Bailey has also written on the significance of social structures and the processes associated with the societal resolution of human conflict.

In regard to the subject of deception, Bailey's work concerning the structural facilitation of human values and beliefs, and his work on the cultural integration of morality and the practicality of human deception, are the most significant. Much of this work initially focused on political processes, systems, and leaders, and their relationship to larger societal moral practices and ethical limitations. However, this work ultimately evolved to become more general in application during the course of Bailey's career by examining these phenomena in a broader context. In his later work, Bailey laid the foundation for his beliefs regarding the interplay of human social

interactions and organizational structures, and the use, application, and necessity of deceit.

In much of his early work related to human deceit, Bailey examined the significance, meaning, and purpose of human deception in relation to political processes and the practice of political leadership. Bailey ultimately determined that deception was an inescapable and perhaps even foreseeable consequence of the nature of social and political relationships and the practices that must necessarily be undertaken to exercise political power in a real-world environment.

Perhaps most interesting, Bailey asserts that the political reliance on chicanery is a common feature of the political process, and that this holds true regardless of the stature or public acclaim of any individual political leader. To underscore his assertion, Bailey notes that infamous leaders have employed the same strategies and tactics to manage and control the masses toward illicit ends, as have leaders who are widely viewed more positively, and are thought to be responsible for positive contributions to larger society. Further, the deception employed by political leaders is thought to be widespread. It involves the false assignment of blame and credit for failures and successes; the establishment of unrealistic expectations regarding the real capacity for political change and societal improvement; and a mischaracterization of the true complexity of significant social, economic, and

political issues in an attempt to mislead the public and achieve larger, often concealed, objectives.

In subsequent writings, Bailey expanded on his earlier discussions of human deception by examining two foundational presuppositions, or “saving lies,” that he believes provide human beings with the tools necessary to bring a sense of clarity and understanding to the complex world around them, and to navigate interactions and regulate relationships that they have with others. More specifically, Bailey compared and contrasted the concept he referred to as “methodological individualism” with the concept he referred to as “methodological holism.”

Methodological individualism refers to the human assumption that society is made up of individuals who are largely bent on acting in their own self-interest toward the accomplishment of their individual agendas. Methodological holism, on the other hand, refers to the paradigm that asserts that individuals largely act out of a perceived need to do what is thought to be morally acceptable and ethically required of them from a societal perspective. This behavior often involves doing for others at the expense of the individual.

Put more simply, Bailey examined paradigms that were previously dichotomously viewed as selfless versus selfish. In his analysis Bailey argued that it was wrong to assign moral preference to the two competing paradigms. Rather, he believed that both were necessary tools that could be used to either help build consensus, or as a weapon in the ongoing competition for power. As a result, these two competing saving lies are not diametrically opposed concepts; rather, they might rightfully be viewed as complimentary paradigms.

A number of important concepts run through Bailey’s collective work. Perhaps most important is the belief that deception and trickery might best be viewed as necessary and, in at least some ways, functional parts of human social interactions and political endeavors. Further, deceitful and manipulative tactics are regularly incorporated in many areas of human industry and human interactions for a variety of divergent purposes, and they are used by individuals who are characterized by both public disdain and acclaim.

Additionally, tactics that have historically been derided as undesirable may ultimately be seen as having both a purpose and a role in

social institutions and social interactions. Similarly, some of the previously identified dichotomies that were thought to exist between lauded and denigrated types of human behavior may be misguided in that these two supposedly opposed types of behaviors may ultimately be viewed as complementary, rather than wholly incompatible. Finally, it is important to look behind the ostensible meaning and purpose of human behaviors, institutions, and presuppositions in an attempt to determine their true significance and the real value and meaning that they hold for larger society specifically, and human interactions more generally.

## Bankruptcy

English legal practice in the 18th century sent numerous destitute and insolvent people to debtor’s prisons until they paid the debt. With no way

*General James Oglethorpe was the colonial representative from England's King George II to the American colonies. Deeply moved by the sufferings of bankrupt prisoners in England, he created a refuge for debtors in America, a colony that he named Georgia. Since that time, the state of Georgia has included a constitutional ban on imprisonment for debt.*

to work to earn money for repaying their debt(s), they would languish or die in debtor's prison. James Oglethorpe, who had investigated debtor's prisons while serving as a member of Parliament, was deeply moved by the sufferings and abuses that he witnessed among the prisoners. As a result of his findings of abysmal conditions, he took a leading role in organizing a company that sponsored a refuge for debtors. In 1732, King George II gave James Oglethorpe a charter to create this new colony in America, which he would name Georgia. As a consequence, the state of Georgia has included in its constitution a ban against imprisonment for debt.

Bankruptcy provides an alternative legal remedy to debtor's prison. Insolvent debtors can find refuge and relief from their creditors through bankruptcy, including bankruptcy law protections

enforced by the courts that allow for reorganization and time for eventual repayment. Totally insolvent debtors with no reasonable hope of repaying their debts may find relief from their insolvency by the court excusing their debts. Depending on the court decision, bankrupt debtors may be required to undergo psychological counseling, financial counseling, and other remedies that will reduce their likelihood of repeating unsound spending practices.

Modern business and bankruptcy practices often seek to reorganize a company's finances. Instead of liquidation of all assets and distribution to creditors, reorganization allows a business or government to continue to operate. The insolvent entity, when declared bankrupt, is given legal protection by the bankruptcy courts from creditors. It also provides an organized way for creditors to have an opportunity to be repaid. In some cases, bankruptcy gives persons or others owed money for taxes, wages, services, or goods to be able to collect payment.

In the case of companies that are not liquidated, they will be required to reorganize their operations, possibly restructure their debts with their creditors (usually with the aid of the court), and other remedies that will enable the company to re-enter the economy as a productive enterprise.

Around 1900, the U.S. Congress moved to federalize bankruptcy cases under Article 1, Section 8, Clause 4, of the U.S. Constitution. This section allows Congress to enact "uniform laws on the subject of bankruptcies throughout the United States." Today the subject of bankruptcy law is located in the U.S. Code at Title 11. Bankruptcy courts are legislative courts created by Congress under Article I of the Constitution. The judges are appointed of a set number of years.

Title 11 of the Bankruptcy Code has several chapters. Chapter 11 is for business rehabilitation, whereas Chapter 13 is rehabilitation for individuals. In Chapter 11 and 13 cases, the individual or the business retains ownership of the assets and develops a repayment plan that is agreeable to the court.

Chapter 7 bankruptcy cases are for liquidation of either an individual's assets, or those of a business. The debtor turns over all nonexempt property to a bankruptcy trustee, who then distributes the assets to the creditors. However, there

are some limitations. If a debtor has engaged in fraudulent behaviors, such as hiding records about their financial status, then the debts will not be excused.

In addition to the federal bankruptcy courts, there are various state laws on the subject of debtors. State laws play a major role in bankruptcy cases by setting terms for the exclusion of assets from attachment for the settlement of debts. Exempted property defined by state laws widely varies. Exempted items usually include personal clothing, household goods, or an older model automobile. Other protected assets include Social Security payments, unemployment benefits, trade tools, books, or a homestead in some states.

In bankruptcy cases, the debtor has the obligation to disclose all assets, even if they do not believe that the asset has any value. The decision about the value of an asset is up to the creditors, not the debtor. If a debtor does not disclose an asset, it is grounds for reopening the bankruptcy case. The bankruptcy trustee may then seize the “unscheduled” asset and have it sold for the benefit of the creditors. Undisclosed or “unscheduled” assets may be grounds for filing criminal charges of fraud and/or perjury if the trustee or bankruptcy judge believes it is warranted.

The Bankruptcy Abuse Prevention and Consumer Protection Act (BAPCPA) of 2005 made major changes to the Federal Bankruptcy Code. It was a controversial act that was argued to favor creditors over debtors. Some provisions were designed to prevent or remedy debtor frauds that were designed to use bankruptcy as a shield for people who were using the bankruptcy laws to “game the system.” Of major concern were credit card abusers who sought bankruptcy refuge.

### **Bankruptcy Fraud**

There were over one million bankruptcy filings in the United States in 2012. Cases of bankruptcy fraud undermine public confidence in the justice of the system. It also taints the reputation of honest people who are unwillingly associated with the lies and deceptions of criminals committing frauds.

Bankruptcy fraud in the United States is a federal crime. The fraud statutes usually focus on the mental state of the actors when committing the alleged acts of fraud. There are a number of

ways that people commit bankruptcy fraud, such as hiding assets, destroying or hiding financial records, or making false claims or declarations. Another way to defraud creditors is to distribute assets to relatives, friends, or allies.

Many cases involve debtors who hide assets. The goal is to keep from forfeiting them. Assets that are easy to hide are expensive jewelry, bearer bonds, cash, or properties registered in aliases. Some debtors seek to hide assets by transferring titles to relatives or some criminal associate who hides the assets. When these deceptive practices are successful, they raise the cost of lending, harming innocent borrowers.

Some debtors commit fraud by intentionally filing forms submitted to the bankruptcy court that are either incomplete or contain false statements. Another tactic used by unscrupulous debtors is to file for bankruptcy in multiple states, sometimes using aliases and false information. They may also use real information several times. The effect of multiple filings is to hinder the legal process of the bankruptcy courts. The multiple filings may also provide the criminal debtor more camouflage with which to hide assets.

Bribery of court-appointed trustees is another corrupt practice that some debtors have successfully used in order to cheat creditors. Criminals may combine these forms of fraud with other crimes such as identity theft, money laundering, mortgage fraud, and public corruption.

A growing abuse is the “petition mill” fraud. The criminals working the petition mill falsely claim to a poor tenant facing eviction that they can help. Pretending to be a consulting service, the petition mill lies to the tenant by claiming to be negotiating for the client, when in actuality, it is filing for bankruptcy in the name of the “client.” Meanwhile it is also collecting “service” fees, which are often exorbitant. When the tenant’s savings are depleted, the petition mill moves on to its next victim.

The Federal Code, Title 18 U.S.C. § 152 (concealment of assets, false oaths and claims, and bribery) deals with nine crimes that involve lying in a bankruptcy case. The punishable acts require that the government be able to prove that bankruptcy fraud was knowingly and fraudulently committed. The nine crimes are: (1) concealing property of the debtor’s estate from the court; (2) making a

false oath; (3) committing perjury; (4) presenting a false proof of claim against a debtor's estate; (5) receiving property from the debtor's estate with the intent to circumvent bankruptcy proceedings; (6) taking a kickback for forbearing on a claim against the debtor; (7) while acting as an agent, transferring or concealing property of an individual debtor or corporation; (8) "cooking the books" to hide a debtor's financial affairs; and (9) withholding property or financial affairs from the U.S. trustee or court.

The U.S. Department of Justice's antibankruptcy fraud program, the U.S. Trustee Program (USTP), seeks to identify fraud or abuse of the bankruptcy system. The program uses techniques to measure fraud or errors in personal bankruptcy filings.

Bankruptcy fraud is different from strategic bankruptcy, which is not a crime. This tactic may be used by a financially solvent company in order to achieve an important business goal that will make it more profitable. An example occurred in 2002 when Kmart filed for bankruptcy under Chapter 11. This gambit allowed the company to break long-term rental leases it had made for properties where it had stores. Because the stores had become unprofitable, bankruptcy was a way to break or renegotiate these long-term leases to its financial favor.

## Barnum, P. T.

One of the most famous sayings attributed to Phineas Taylor (P. T.) Barnum is "There's a sucker born every minute." However, there is no evidence that Barnum actually uttered that phrase. Barnum was an entertainment promoter who presented and operated displays, museums, singing tours, and music halls that helped create and define popular culture in 19th-century America. His instructive observation about his role as a public entertainer and trickster is this: "The public appears disposed to be amused even when they are conscious of being deceived." In the arena of lies and deception, Barnum's "victims" came willingly.

Born in 1810, Barnum left the grocery business and entered the world of promotions in 1835, when he bought the rights to an exhibition featuring Joice Heth, who was described as "a negress aged 161 years, who formerly belonged to the father of Gen. [George] Washington. She has been a member of the Baptist Church for one hundred and sixteen years, and can rehearse many hymns, and sing them according to former custom." Heth would also recount stories about Washington as an infant to inform the audience. A year later, Heth died at the less remarkable age of 80, but Barnum's career was launched nonetheless.

Barnum remained in the business of identifying and catering to public appetites until his death in 1891. At that time, the *Washington Post* declared him to be "the most widely known American that ever lived." Scholars say that he helped craft the American middle class, and then entertained it, educated it, and took some of its money, all while becoming a national celebrity. While his name today often connotes shady practices, President

James Garfield referred to Barnum as “the Kris Kringle of America,” hardly an indictment then or now. He demonstrated his public spiritedness by serving in the Connecticut General Assembly four times between 1865 and 1879; in 1875, he was elected mayor of Bridgeport, Connecticut.

Barnum created and perfected many devices to harness public attention. By any strict measure, these devices misled the public, but no one objected. In fact, customers came by the tens of thousands. Among his refinements in mass persuasion was the ballyhoo or street bally, which was “the art of attracting a crowd,” and “endless schemes to start people talking about . . . attractions.”

Barnum’s enterprises included a museum that he acquired in 1841, the American Museum in New York City. In those days, museums were evolving from philanthropic enterprises to commercial entities that displayed wild animals, natural history artifacts, waxworks, and other curiosities. Barnum’s displays targeted a middlebrow audience, whereas cultural critics desired the sophistication of European museums. This criticism is embodied in the Museum of Modern Art (MOMA) and the Smithsonian Institution, which were intended to supplant the vulgar commercial facilities such as Barnum’s museum. Nevertheless, Barnum’s facility served a million visitors at 25 cents apiece, and children for half price.

Barnum was also shaping culture through the museum’s theater, which presented morality plays such as *The Drunkard* and *Uncle Tom’s Cabin*. The plays had two themes, which were slavery and temperance, and had a single message: the joys of morality and the inevitable harms of vice. The moral stage was a safe alternative to conventional theaters, where Christians had reason to worry. Barnum’s facility was didactic, guiding the lower classes toward virtue and away from urban wickedness. Successors to Barnum’s American Museum were called dime museums and stood in contrast to the cultural palaces of MOMA and the Smithsonian. Dime-museum theaters also spawned vaudeville.

As the 19th century closed, elites lamented that even the World’s Columbian Exposition, held in Chicago in 1893, had been “Barnumized.” Whereas the midway at the exposition presented foreign cultures as oddities, the White City

exhibition had a sophisticated tone. However, after three months and \$1 million in losses, middlebrow activities were brought into these areas. This sort of broadening was derided and labeled as a “transitory disease . . . Barnumism.”

Many have asked how Barnum drew attention to his events. He pioneered the use of press agents and handbills to inform citizens that the circus was coming. Another group followed and planted stories in the local newspapers. A third group arrived four hours before the circus train to scout the circus parade route. Circuses were sometimes denounced as immoral by some, but the parade and publicity were staged to demonstrate their harmlessness. The parade is the highest refinement of the street bally; even today, New York City’s Macy’s Thanksgiving Day parade is a department store publicity vehicle.

One of Barnum’s simplest devices was a man walking along a crowded sidewalk carrying two bricks. He would put one down and walk on to place the second, then he would return to the first, pick it up, and place it beyond the other brick. In this leapfrog fashion, citizens would follow the man to Barnum’s destination to figure out what was happening. Barnum also created the contest as a publicity vehicle in 1850, when he offered \$200 for the best song written for Jenny Lind, the “Swedish Nightingale,” who he brought to the United States on a landmark tour. The publicity was effective. In 10 months of touring, Lind earned \$176,000 (\$5 million today) from Barnum, who took in \$700,000 (\$20 million today), though he had to cover the tour’s expenses.

## Baseball

The game of baseball was first referred to as “America’s pastime” in 1856, and from the beginning, deceit has played a central role in entirely legal baseball plays envisioned by the founders of the game. For example, at least once per season, a major league player will fall victim to the hidden ball trick. Even more often, a player will be caught too far from the bag, and be picked off by an observant pitcher. Pitchers, catchers, coaches, and batters have even created extremely complex series of signs in order to deceive opposing teams from being aware of their upcoming strategies. All of these elements of deceit serve to aid teams in legal ways throughout a game.

Not all lying and deceit, however, is as honorable. Consider the long-winded name of an American Studies course once offered at Carleton College: “An inside look at fighting, cheating, corking, scuffing, sign-stealing, drinking, race-baiting, name-calling, spitting, law-breaking, gambling, spiking, bug-hiding, doping, tomato-dropping, game-fixing, arrow-shooting, grooving, spying, lying, head-hunting, water-logging, freezing, sand-dumping, ridge-building, tackling, greasing, superball-stuffing, skull-smashing, head-pounding, potato-carving, bribing, lemon-tossing, field-burning, fling and other everyday occurrences in our nation’s beloved past-time: A historical analysis of ethics and ethical decision-making in Major League Baseball.”

This list provides only a sampling of the ethically questionable occurrences within baseball that could be labeled as either lying or deception. Baseball has seen more than its fair share of rule stretching by players, managers, and owners, including George Brett’s passion for pine tar, Albert Belle’s cork, John McGraw’s belt grab, Leo Durocher’s strategically placed bug, Barry Bonds’ steroids, Preacher Roe’s spitball, Danny Almonte’s birth certificate, Pete Rose’s gambling,

and the Black Sox throwing games. The following examples focus on a few of the most memorable bouts of lying and deceit in the history of American professional baseball.

### The Black Sox Scandal

The 1919 World Series would go down in history as producing the most famous scandal in all of professional sports, let alone baseball. Eight players for the Chicago White Sox were accused of intentionally throwing the series against the Cincinnati Reds. Ironically, the *Philadelphia Bulletin* published a poem before the World Series began, reminding readers that baseball was the cleanest sport in the country. Almost a century later, the details regarding the scandal and exactly how each of the players was involved remain relatively understudied.

On only the second pitch of the World Series, the White Sox starter hit the leadoff Reds’ batter. This action signaled that the White Sox were in on the fix. The players—eight total—were not found to be criminally guilty, yet they were still issued lifetime bans from Major League Baseball (MLB). The story made front-page news across the country, and an assumption of guilt—especially given the team’s overall performance in the series, compared to the season as a whole—was enough for baseball officials to justify the ban. The eight banned men were Shoeless Joe Jackson, Eddie Cicotte, Lefty Williams, Buck Weaver, Chick Gandil, Fred McMullin, Swede Risberg, and Happy Felsch. The scandal so marred the team that the 1919 White Sox are historically remembered as the Black Sox. Williams lost three games in the best-of-nine World Series, which is still a record.

### Pete Rose

In February 1989, outgoing commissioner Peter Ueberroth and his successor, National League president Bart Giamatti, met with Cincinnati Reds third baseman Pete Rose regarding allegations that he was betting on baseball, a violation of Rule 21, “Misconduct, (D) Betting On Ball Games.” The rule stated, “Any player, umpire, or club or league official or employee, who shall bet any sum whatsoever upon any baseball game in connection with which the bettor has a duty to perform shall be declared permanently ineligible.”

Despite the commissioners dropping the investigation at one point, *Sports Illustrated* went public with details of the allegations in an issue that coincided with MLB's opening weekend in April 1989. Attorney John Dowd, hired by MLB to lead the investigation, interviewed many individuals associated with Rose. By May, he reported that Rose had bet on 52 Reds games in 1987. Most concerning were his gambling activities while managing the team following his playing career. While players have some opportunities to influence games through their own performance, managers control the games and make decisions that could easily alter outcomes to favor personal betting needs.

Despite Dowd's report, Rose remained defiant in claiming his innocence. However, facing harsh punishment, Rose and his attorney sought a compromise with MLB. On August 24, 1989, Rose agreed to a voluntary lifetime ban from baseball, based on three key provisions: MLB would make no finding of fact regarding gambling allegations, and would halt its investigation; Rose would neither admit nor deny the charges; and Rose could apply for reinstatement after one year. In other words, in return for his voluntary placement, Rose was spared a formal ruling on his gambling. His reinstatement was applied for twice, but it was never approved.

In 2004, Rose finally admitted in his book, *My Prison Without Bars*, that the gambling accusations were true, a confession that he claimed he had already admitted to Bud Selig, who became the MLB commissioner in 1998. Rose, however, stated that he always bet on the Reds, never against them.

Despite being the all-time Major League baseball leader in hits, games, and at-bats, and being an All-Star 17 times from five different positions, Rose remains outside the MLB Hall of Fame. He has even been unable to have his number retired by his Cincinnati Reds. Since there is no evidence that he ever bet against the Cincinnati Reds, there are many who believe that Rose's punishment was severe, especially when compared to the activities of major league players during the steroid era.

### **Corked Bats: Albert Belle and Sammy Sosa**

Both the Black Sox and Pete Rose were criticized for potentially seeking monetary profits

in exchange for play. Albert Belle, Sammy Sosa, and four other players since 1970, however, were caught and suspended for intentionally trying to boost their performance through illegally altered bats. When considering altered bats—either through the insertion of cork or rubber balls—MLB's rule 6.06 (d) states the following:

A batter is out for illegal action when: (d) He uses or attempts to use a bat that, in the umpire's judgment, has been altered or tampered with in such a way to improve the distance factor or cause an unusual reaction on the baseball. This includes bats that are filled, flat surfaced, nailed, hollowed, grooved, or covered with a substance such as paraffin, wax, etc. No advancement on the bases will be allowed and any out or outs made during a play shall stand. In addition to being called out, the player shall be ejected from the game and may be subject to additional penalties as determined by his League Punishment advisor.

For both Belle (caught in July 1994) and Sosa (exposed in July 2003), the discovery of their cheating ways was public, thanks to shattered bats that exposed fans and players alike to the corky contents.

### **Banned Substances**

In the past eight years, the most prominent discussion regarding lying and deception in American baseball has centered on the use of banned substances by players in an effort to improve performance or minimize time away due to injury. David Wells, former MLB pitcher, suggests that just under half of all players are "juiced." Players such as Ken Caminiti, Mark McGwire, and Alex Rodriguez have all admitted to using performance-enhancing drugs at one point during their careers (typically steroids or human growth hormone). The issue was severe enough in 2005 that the U.S. Congress called in players to testify about performance-enhancing drugs and a specific nutrition center called BALCO. Toward the end, Chicago White Sox outfielder Jose Canseco, New York Yankees third baseman Alex Rodriguez, Baltimore Orioles first baseman Rafael Palmeiro, St. Louis Cardinals first baseman Mark

McGwire, and Baltimore Orioles right fielder Sammy Sosa were forced to swear an oath and answer questions.

For San Francisco Giants left fielder Barry Bonds, his single-season home run record in 2007 will forever be marred by his association with steroids. In 2007, Bonds was indicted for perjury and obstruction of justice for telling a 2003 federal grand jury that he did not knowingly use performance-enhancing drugs. In 2011, a federal court found Bonds guilty of obstruction of justice for his original evasive answer under oath.

In summer 2013, 13 baseball players were suspended for 50 or more games because of their connection to Biogenesis (a now closed rejuvenation clinic) that supplied human growth hormones (HGH) to players. Most importantly, Ryan Braun of the Milwaukee Brewers accepted a season-long ban (after successfully appealing a previous positive HGH test and accusing the blood sample collector for incompetence), and Rodriguez is facing at least a season-long ban, despite a career ban being mentioned throughout the media at one point.

### Conclusion

There are numerous examples of how baseball players have attempted to lie or deceive the general public, their teammates, and the sport of baseball as a whole. Whether they are gambling, altering equipment, or modifying their bodies, players will continue to be lured, despite the best efforts of baseball to minimize temptations and control the potential for players and managers to shirk the rules.

## Basketball

Deception plays an important role in basketball both on and off the court, from physical moves in the game designed to mislead an opponent to deceptions in player drafts. The referees can be a target of deception, with players faking injuries, but referees have also been investigated for deception.

### Offensive and Defensive Deceptions

On the court, deception involves offensive players attempting to fool defenders and find the opportunity to score. Two of the most common offensive moves are the "pump fake," faking a shooting motion and subsequently making another move; and the "crossover," a quick change of dribbling motion from one side of a player's body to another. The crossover is often listed as one of the most potent moves in the game. It involves a player handling the ball and leaning his body in one direction, giving the appearance that the player will attack in one direction, but then actually attacking in the opposite direction. This often leaves the defender unbalanced because of the quick change of direction, freeing the offensive player to either take a shot or drive to the basket.

This particular move has been used to devastating effect by players such as Michael Jordan, Tim Hardaway, Allen Iverson, and Dwyane Wade. For example, the game-winning shot by Michael

Jordan of the Chicago Bulls in the 1998 National Basketball Association (NBA) finals against Bryon Russell of the Utah Jazz was made possible by a crossover.

Another important move that relies on deceit is the pump fake. The ball handler feigns a shooting motion, without actually lifting his feet from the ground. Often, the defender will respond by jumping in an attempt to block the shot. This response gives the offensive player an opportunity to draw a foul or drive to the basket. Masters of the pump fake are Michael Jordan, Kobe Bryant, Dwyane Wade, and Paul Pierce. In Game 1 of the 2008 NBA finals, Paul Pierce of the Boston Celtics

*Paul Pierce playing for the Boston Celtics, January 13, 2008. An important basketball move that relies on deceit is the pump fake. Pierce used it in one of the most memorable plays in National Basketball Association (NBA) playoff history—a three-point shot against the Los Angeles Lakers in Game 1 of the 2008 NBA finals while his team was down three points.*

made what some consider one of the most memorable plays in recent playoff history. With his team down three points to the Los Angeles Lakers, Pierce pump faked a three-point shot, which caused his defender Pau Gasol to challenge the shot. Pierce was subsequently hit by the falling Gasol, which resulted in a foul, but he still made the shot after contact. This was a pivotal turning point in the game.

### Referees

Referees are sometimes also the targets of deception because of their authority to call personal fouls on players. If a player receives six fouls, he is automatically disqualified from the game. A personal foul can also cause a team to give up possession of the ball or give a player the opportunity to take free throws (unopposed shots taken from the restricted area of the court). Players sometimes use deception to draw fouls by intentionally falling or faking injuries after little or no physical contact. As a result, deceived referees believe that misconduct has occurred and call a foul.

One example of this kind of deception is “flopping.” Flopping can transpire in many ways. One of the most popular forms is when a defender immediately falls to the ground upon feeling contact, giving the appearance of an offensive foul. The offensive player can also flail his body and fall to the ground upon contact with a defender, giving the appearance of illegal defense. Other in-game instances of deceit along these lines include faking injuries, in which a player feigns being hurt to give the appearance of a foul.

Basketball referees have also come under suspicion for deceptive activities. In 2007, the *New York Post* broke a story reporting that the Federal Bureau of Investigation (FBI) was investigating allegations that an NBA referee had been betting on games, uncovering one of the largest scandals in NBA history. The referee, Tim Donaghy, had reportedly been betting on games since 2005. In 2008, he pled guilty, and was sentenced to 15 months in prison and three years of supervised release. In one of his statements, he specifically acknowledged a playoff game, widely believed to be Game 6 of the 2002 Western Conference Finals between the Los Angeles Lakers and Sacramento Kings, in which fouls in full view of the referee were ignored because it was in the NBA’s interest

to add another game to the series. Statistics show that during the two seasons under investigation, games refereed by Donaghy resulted in teams scoring more points than expected by the Las Vegas sports books 57 percent of the time, a discrepancy with the odds of one in a thousand of happening.

### Off the Court

In professional basketball, such as the NBA, deception is also evident off the court. For example, one of the most important activities in the off season for NBA teams is the draft. During the off season, all teams are allowed to select recruits from a pool of draftees that include collegiate players and international professionals. NBA scouts rank players based on their opinion of a player's potential. They evaluate each player based on several criteria, including physical measures (i.e., height, wingspan, jumping ability, and speed) and mental criteria (i.e., knowledge of the game, leadership ability, and maturity).

Agents, players, and even college coaches will often resort to deception in order to raise the draft "stock" of the player. Lies take place when reporting the age of potential NBA players because younger athletes represent greater potential for growth. In 2011, the Minnesota Timberwolves drafted Tanguy Ngombo, a 21-year-old star athlete from Qatar. After the NBA draft, however, the Timberwolves discovered that Ngombo was 26 years old and a veteran of a professional basketball league in the Middle East. The NBA stipulates that any international player over the age of 22 is ineligible for the draft, and can join a team only as a free agent. However, because the occurrence of falsified ages is extremely rare, the NBA made an exception and allowed the Wolves to keep their pick.

Deception most commonly exists during interviews between basketball teams and the media. Players, coaches, and managers lie to the media in order to protect locker room morale, promote team unity, protect their image, or for a variety of business reasons. Players will often tell the media that they are happy after being traded to another team in order to be seen as cooperative and team-oriented individuals. However, most players actually resent trades because it forces them to move their family, start over with a new team, and prove their worth with a new organization.

In an effort to maintain a positive morale within the team and to keep fans hopeful and engaged, players will also tell the media that their team is competitive and is going to make the playoffs, even though the team has no realistic chance of doing so.

Lies do not always remain unnoticed. One of the worst examples of an individual caught lying occurred in spring 2012, when Dwight Howard of the Orlando Magic was confronted in an interview about reports claiming that he asked for his coach, Stan Van Gundy, to be fired. Although evidence proved the reports accurate, Howard publicly denied meeting with team management regarding Van Gundy's termination, and denied requesting a trade to another team. This resulted in a situation in which Howard could no longer comfortably play under Van Gundy because of the animosity between them. The Orlando Magic subsequently fired Van Gundy and traded Howard.

## Battle of Fishguard

Between February 22 and 24, 1797, the French launched an attack on Great Britain during the War of the First Coalition. Ultimately, it would end up being the last time in Britain's history that it was invaded. While the French had a stronger presence during the invasion, the British were successfully able to deflect French aggression by bluffing about the strength of their military in the immediate area. Through this deception, the French agreed to an unconditional surrender, despite having a significant advantage (albeit an unknown one) if they had opted to engage in further battle.

### The Invasion is Planned

The initial invasion was planned by General Lazare Hoche. He envisioned multiple attacks on Great Britain in order to assist Wolfe Tone's Irish Republicans. In the initial stages, two groups of forces would land on British soil in an effort to divert attention away from the third group, which would ultimately come to ground in Ireland. However, the plan failed miserably. Only one of the three groups (intended to land in Wales) was able to do so because of a combination of weather and personnel problems. After landing in Wales, the successful group then marched toward Bristol. Commander William Tate's forces consisted of almost 1,500 troops from La Legion Noire. More than half of those troops were irregulars, relatively untrained and unprepared for what was to come when compared to their full-time counterparts. They arrived in Wales on four French warships at Carregwastad Head (in the immediate vicinity of Fishguard) on February 22.

The immediate details after the landing have become sketchy over the years. An 1892 account claims that the French struggled to gain entry into Fishguard harbor, but no previous versions of the story mentioned that detail. As a result, it seems that the detail may be a stretch. Upon making land, the irregular soldiers lost any sense of discipline. They started by deserting the group, and then turned to looting for personal gain. The troops that chose to follow orders were almost immediately met by a group of 500 British. Most of these forces included reservists, militia, and a few sailors, who were led by John Campbell.

Much like the French side, the British forces were not used to working together.

The actual battle began with skirmishes between the two sides. With Fishguard led by a volunteer infantry, it took the efforts of Lord Cawdor moving his men nearly 30 miles overnight. Upon arriving, Cawdor was handed full responsibility and authority over command. He had control of some 400 troops and a series of artillery weapons. Yet, he was slow to arrive.

By February 23, the French had begun moving inland, and were becoming concerned for the British. Thomas Knox, the leader of the British efforts at that time, was ultimately given three choices: attack the French, defend Fishguard, or retreat toward Cawdor's men as they moved toward Fishguard. He chose to retreat—reasoning that he would have a greater chance against the significantly larger French group if all the British infantry was together.

By the time that Knox and Cawdor's men combined, Tate was beginning to struggle with the French effort. Discipline was nonexistent because his troops preferred drinking wine to waging battle. The irregulars who were still involved began calling for a mutiny. With their egregious behavior, the Welsh citizens quickly sided with the British forces. As a result of all these events, French and Irish officials began discussing the potential need to surrender.

### Change of Strategy

By dark on February 23, the British had returned to Fishguard with Cawdor in command, and opted to immediately attack the French and Irish. With a total of 600 men, they unknowingly marched directly toward an ambush. With the dwindling light and the narrow passages, Cawdor had a change of strategy while headed to attack. He opted to retreat to Fishguard and wait until February 24 to take action. This decision likely prevented the annihilation of his troops. Before the sun would rise, however, French officers arrived to negotiate a conditional surrender with Cawdor. In a high-risk, high-reward strategy, Cawdor bluffed and told the French that because of his superior forces, he would only be willing to accept an unconditional surrender, and would attack at 10:00 A.M. if the French did not decide to end hostilities by that time.

On the morning of February 24, the British lined up in battle formation and waited to see how the French and Irish would respond to the ultimatum. Despite efforts to delay the decision, they opted to accept the unconditional surrender offer, and the three-day skirmish ended. The French had lost—and lost quickly—with barely any fighting actually taking place. Legend has it that many French troops saw local women wearing red jackets and tall hats, and assumed that they were British soldiers. The number of such women may have impacted the decision to surrender as quickly as the French chose to.

The hero for the British was Cawdor, who orchestrated the bluff. When the French pushed for a safe passage home if they agreed to surrender, he stated: “The Superiority of the Force under my command, which is hourly increasing, must prevent my treating upon any Terms short of your surrendering your whole Force Prisoners of War.” The only understood reason as to why the French and Irish fell for this bluff was the belief that the British had to be reinforced if they were willing to make such a clear claim of superiority.

In a counterfactual sense, it would be interesting to see how the entire saga would have played out had Tate refused Cawdor’s mandate. Given the numbers of French and Irish soldiers who had already abandoned the mission, both sides were in equal disarray. The British went from nearly walking into an ambush the night before to winning on a bluff just a few hours later. While the battle would have ended either way, the forcing of the unconditional surrender sent a strong message to those who looked to attack British shores in the coming years—even though the British were not nearly as strong as perceived. Cawdor successfully turned a relative tie into a victory for the British over the French and Irish, squashing Hoche’s initial plans before they could even gain traction. They had snatched victory from the jaws of defeat.

## Battle of the Bulge

The Battle of the Bulge was the German offensive of December 16, 1944, to mid-January 1945 in the Ardennes Forest of Belgium during World War II. On September 16, 1944, Adolf Hitler announced a counteroffensive in the Ardennes with the goal of capturing Antwerp. German Panzer units had been organizing in the areas near the Ardennes Forest in Belgium near the German border. Allied forces made successful landings in France in June (Operation Overlord) and the Netherlands (Operation Market Garden) and were making steady progress toward the border of Germany. Military planning for the offensive was delegated to General Alfred Jodl of the Wehrmacht Operations Staff on September 25.

Hitler chose the location of the Ardennes because it was the weakest part of the Allied line. He believed that an attack at this place would separate the British and the American forces and would hopefully lead to political problems between the Allies. The terrain was also ideal because it would require few German divisions to defend, and it was a heavily wooded area, thus providing secrecy from Allied air reconnaissance.

The final plan composed by Jodl was code-named *Wacht am Rhein* (Watch on the Rhine), involving the OB West commanded by Field Marshal Gerd von Rundstedt and Army Group B under Field Marshal Walter Model. Upon review of the plan, von Rundstedt and Model revised and returned it to Jodl for Hitler’s approval. The proposed changes were not approved and ultimately Hitler’s original plan was approved on December 9, 1944, because he could not be swayed otherwise. The deception of the plan’s name, which alludes to a Rhine River attack

against the Ardennes, combined with the small number of persons who knew of the plan and the true location of the attack, all helped continue the ruse. For additional security, a separate diary related to the counteroffensive was maintained by officers involved in the planning, rather than by a secretary. All persons involved in the planning knew that the penalty was death if they violated the secrecy of the plan.

Hitler's plans called for the buildup of troops in secret locations without notice by the Allies. German forces gathered east of Aachen, where the Allies would see the false preparations for the counteroffensive, while the real buildup took place near Eifel by the Seventh Army. Northwest of Cologne, military and civilian activity increased during daylight for the benefit of the observing Allied forces. Road improvements, truck and rail traffic, increased anti-aircraft battalions, evacuated civilians, and a ghost army with real and false divisions all contributed to the charade. Meanwhile the real troop buildup continued in the Eifel. Troops hid in small villages; all movements of troops, supplies, and rails took place at night; and the area observed both a shooting and radio blackout. This plan was so well conceived that Allied intelligence failed to pick up on obvious indicators of a coming offensive.

Allied units in the area around Eifel did note changes in the weeks building up to the attack. Civilians reported a buildup of military vehicles, which was disregarded by commanders. Allied air reconnaissance noted train traffic with flat cars of Tiger tanks on the rail line between Düren and the Roer, but no one realized that a branch line went into Eifel. Other reports showed increased troop movements and traffic on the roads. A lack of coordination and communication between Allied air and ground units contributed to the success of the German counteroffensive. Even more unusual is the fact that the weather did not impede daily missions, and that the original attack date was moved from November 27 to December 16 because of problems getting more reinforcements and, more important, fuel to the area.

Three days prior to the attack date, German units began moving into place under the cover of night and using some tricks learned in World War I. Infantry divisions moved into place in sections labeled Area I, which had restraining lines six

miles deep. Artillery moved up, using horses and hay on the wheels to reduce the noise, and were placed five miles from their ultimate destination for the day of the attack. German planes buzzed areas known to have American listening posts in order for motorized vehicles to move into position unnoticed. All of these sections moved up the next day, and were in place two hours before the set time for attack.

In the first days of the attack, the weather in the Ardennes area provided a natural camouflage for the German army. Allied planes were grounded because of fog and mist, thus aircraft could not be called in for support or supplies. Snow allowed the Germans to disguise fortifications such as pill-boxes and gun emplacements, and soldiers wore white camouflage to disguise their uniforms. As the days passed, the weather warmed and the fog briefly lifted, allowing the Allies to see the enemy tanks. Roads became impassable because of mud, and then the winter began, bringing more fog, snow, and rain. This new storm hampered the German supply line and allowed the Americans to bring in their armor. The fog lifted, and Allied bombing runs began to attack German vehicles in the area. The weather contributed to the deception on both sides, giving each an advantage as the battle continued.

### **Allied Deception**

The Allied deception in the Battle of the Bulge was the secret counteroffensive launched on January 3, 1945, by the Third Army commanded by General George S. Patton. Allied command held a meeting at Verdun on December 19, where they assessed the situation and reviewed the messages from ULTRA indicating the German plans. General Dwight Eisenhower authorized General Omar Bradley and Field Marshal Bernard Montgomery to launch a counterattack. Patton was told to launch an attack to relieve Bastogne and drive north to St. Vith. Patton had already ordered his staff to prepare for this possibility and was able to promise an attack on Bastogne in 72 hours, despite his army being over 100 miles from the city. Bastogne was relieved on December 26.

Hitler counted on the inability of the Allies to respond to a surprise attack that split them in two. Eisenhower reacted quickly and changed the command structure, overruling any challenges

that emphasized the British over the American military. Hitler realized that the Ardennes campaign would fail, so he changed his focus to the Alsace area and withdrew his forces. The Allied success in the Battle of the Bulge relied on the cooperation of the weather and the Allies' ability to quickly reorganize. In many ways, Hitler was the victim of his deception because he took command instead of listening to his generals. It is possible that if he had followed the advice of his commanders Model and von Rundstedt, the battle might have turned into a German victory.

As a matter of deception, Hitler's counter-offensive in the Ardennes was a great success. Armies and supplies in both the decoy area near Cologne and in the real areas in the Eifel were moved into place with little reaction from the Allies. The attack was so unexpected that typical indicators of impending military action by the enemy were ignored. Hitler correctly assumed that the attack would cause a rift between the Americans and British, but he did not count on the command abilities of General Eisenhower. The Germans benefitted from both the poor weather conditions, which effectively hid their armament, and the fact that the Allies did not plan on a counterattack. However, the same factors that helped with the deception of the German plan also contributed to German failure in battle. German reinforcements could not move up, the weather cleared and allowed for Allied air attacks, and German positions were compromised by thawing conditions.

The Battle of the Bulge is a turning point in history, and it is a good case study in the effectiveness of military deception. The ability to carry out an operation of this size without being detected indicates the experience of military planners in Germany, who employed lessons learned from previous military actions in the area of the Ardennes. The Allies also achieved a level of deception by being able to change the route of their army in a matter of days and to counterattack without being detected. The outcome of the battle exposed the weaknesses in the Allied command and signaled the need for better communication between air and ground forces.

## Beatles Hoax

The Beatles were a rock and roll group that formed in 1960 in Liverpool, England. The band's classic line-up included George Harrison, John Lennon, Paul McCartney, and Ringo Starr (stage name for drummer Richard Starkey, who replaced the band's original drummer, Pete Best). At the height of their career, the Beatles dominated the airwaves and produced a record-breaking number of hit singles and albums. To this day, they remain one of the best-selling musical acts since the advent of recording technology.

In addition to their commercial success, the Beatles were critically acclaimed for the range and quality of their rapidly evolving music, much of which is credited to the writing team of Lennon and McCartney, even though some songs were actually solo compositions. Because of personal and professional tensions, the two frequently wrote independently of one another, especially toward the end of the band's career. The Beatles' groundbreaking albums and innovative songs challenged the conventions of pop music in terms of content, format, and length. The influence of the Beatles was not limited to their music, however. During the decade when they were active as a band, they exercised a significant influence on culture, fashion, grooming, religious beliefs and

A Beatles tribute prominently stands in an unlikely spot—downtown Ulaanbaatar, Mongolia. The sculpture mimics the *Abbey Road* album cover, which has fueled the conspiracy theory that Paul McCartney died in 1967, and was surreptitiously replaced by a look-alike. Like the cover, which some fans argue symbolizes a funeral march, Paul is set off from his companions; he is also the only one barefoot.

practices, and social mores. In 1970, the band broke up, and each of its members went on to pursue successful solo careers.

### **“Paul Is Dead” Rumor**

In 1969, a rumor began to spread that Paul McCartney had died in an automobile accident in 1967 and had been replaced by the band with a look-alike. Speculation regarding Paul’s possible death was perhaps fueled by his relative absence from the media, from which he says he was taking a break at that time. The first known printed mention regarding the rumor appeared in an article written by Tim Harper that appeared on the front page of the September 17 edition of the *Times-Delphic*, the student newspaper for Drake University in Iowa. Harper claimed to have learned about Paul’s death from his friend, Dartanyan Brown, who said that he heard it from a musician who lived in his dorm, who in turn claimed that he heard of Paul’s death somewhere in coastal California.

Tracing the rumor back to its origin has proven an impossible task because it involves a pattern

of information transmission that folklorists specializing in urban myths refer to as “friend of a friend” (FOAF), in which one source references another, which points to yet another, and so on. In October 1969, disc jockey Russell Gibb of WKNR in Detroit related the rumor. Later that same month, Roby Yonge of radio superstation WABC in New York City discussed it at length on his show. Before long, the rumor had become such a pop culture phenomenon that it was reported upon by such respected mainstream news and entertainment media outlets as the *New York Times*, *Life* magazine, and *Time*. In response to the rumor’s rapid spread, the Beatles issued a press release denying that Paul was deceased.

Because the source of the rumor is unknown, it is impossible to determine whether its author intended to perpetrate a hoax or was merely reporting misinformation in the belief that Paul was dead. Likewise, it is difficult to determine whether initial disseminators of the rumor believed it to be true or were knowingly spreading a false

story to increase print sales and broadcast ratings by exploiting the public's interest in Paul's purported death. While the Beatles officially denied that Paul had died, the group playfully responded to the rumor, fueling it through verbal and visual suggestions that fans still point to as evidence that Paul had died and had been secretly replaced by an imposter.

The Beatles' rather tongue-in-cheek response to the rumor prompted the band's fans to search for hidden hints and minute clues related to Paul's death on album covers, in publicity photos, and in song lyrics. Some inventive fans seemed to find such hints wherever they looked. In searching for clues, fans even played albums backward in the hope of discovering some backtracked reference to Paul's death. An illustrative example of the extent to which some fans looked for such evidence can be found in the way that they interpreted the cover for the 1969 album *Abbey Road*, which featured a photograph of the four Beatles crossing the street single file near the suburban London location of the EMI recording studios (now Abbey Road Studios). Some fans have argued that the image represents a funeral march. Viewed thus, they see sartorial symbolism in the clothing that Paul and his companions wear. John, wearing a white suit, is the preacher; Ringo, in black, the undertaker; George, in denim, the gravedigger; and Paul, who is barefoot and walking out-of-step with his band mates, is the deceased.

The 1967 double-album *Magical Mystery Tour* includes the song, "Strawberry Fields Forever," at the end of which John Lennon is believed by some to have said, "I buried Paul," although the song's published lyrics renders the same passage as "cranberry sauce." Other clues pointed to as evidence of Paul's death have included pictures of Paul, who was left handed, smoking and playing the bass in ways purportedly inconsistent with his left-handedness.

The rumors regarding Paul's supposed death in 1967 offers a classic example of how such stories are spread in the age of electronic media. Decades after the rumor began, it still circulates and continues to foster arguments and claims adherents who use the Internet to advance their theories regarding Paul's alleged death and offer evidence in support of their views. In addition, people who believe or doubt the rumor now use social media

to make their case through blogs and Web pages. In this way, the new media continue to perpetuate what was originally spread by older mass media.

## Behavioral Analysis Interview

One of the most important challenges facing law enforcement investigators is the detection of truths and falsehoods in the statements of the people they interview in the course of an investigation. Witnesses and victims may have motives to lie about aspects of the situation for reasons that have nothing to do with hiding their guilt or protecting the guilty party, and these falsehoods early in an investigation can taint the picture that emerges from the body of evidence, or lead investigators off the trail of the guilty party in pursuit of a red herring. Eyewitness testimony is of questionable reliability because of the construction of memory and various cognitive biases; when active attempts at deception are added to the mix, the interview process becomes fraught with obstacles. Though there are a number of remedies to this, the most popular is the Reid technique, a system of investigative processes designed to make inconsistencies and the possible lies causing them more obvious and to elicit confessions from subjects.

The key element of the Reid technique is the behavioral analysis interview (BAI), which is used not only with suspects, but also with witnesses, victims, and persons of interest to the case.

The BAI is a technique for interviewing witnesses, victims, and suspects in criminal investigations. It is designed to not only collect information, but also to help the interviewer ascertain the truthfulness of the interviewee. The Reid technique is the standard interviewing and interrogation method used by American law enforcement and in much of the rest of the world, but is criticized as too likely to elicit false confessions from suggestible interviewees. The Reid technique was developed by John E. Reid and Associates beginning in 1947, which also runs the Reid Institute to train investigators in the technique. The most recent revision of the Reid technique was published in the fourth edition of *Criminal Interrogation and Confessions* in 2001. Many of the basic precepts of the Reid technique are taught by other interrogation schools under other names. Even police departments and other law enforcement agencies that do not use the Reid technique are likely, especially in the United States, to use a technique heavily influenced by it. Most television shows portray a police force using similar techniques, albeit simplified and filtered through Hollywood tropes such as the “good cop/bad cop” interrogation.

### Behavioral Differences

The BAI component of the Reid technique was developed research in 1973 that found behavioral differences in deceptive and truthful subjects in a controlled test in which truthfulness was established by a polygraph. In such tests, subjects are usually asked to lie or tell the truth about information to which they have no emotional attachment, such as the results of a coin flip or the color of a playing card dealt to them. While the interrogation phase that follows it states the suspect’s guilt in unequivocal terms, and attempts to lead the suspect into a confession, the BAI is confrontational and coercive but not accusatory, and evaluates subjects’ behavior while collecting answers.

The BAI remains Reid and Associates’ flagship product. In contrast with an interrogation, it is described as a nonaccusatory interview, although

it may be used for suspects as well as victims and witnesses, and is still often considered adversarial because of its trademark use of “behavior-provoking questions.” These questions are designed not only to obtain information, but also to provoke behavioral responses in the subject that help the interviewer determine whether or not they are being truthful. Investigators are trained in the verbal and nonverbal cues to look for in order to determine truthfulness while attempting to lead the suspect into a confession.

The interview always begins with innocuous questions such as basic biographical information, even when the subject knows that the investigator is already in possession of that information (e.g., name, age, and residence). This provides a breather and allows the subject to relax while falling into a rhythm of answering questions. It also provides a baseline of behavior for the investigator to observe and compare with later behaviors. Biographical questions are usually followed with a question like, “Do you know why you’re here?” inviting the subject to describe the circumstances of the situation that brought them to police attention. Parties hiding something, even if they are not the person who committed the crime, often give evasive answers, as though in anticipation of avoiding more specific questions later.

The BAI commonly features as the second of three components in a Reid technique interrogation. It is preceded by a factual analysis stage, which guides the investigator through the generation of suspects and leads based on available information. The BAI is in turn followed by the interrogation stage, which is not a question and answer exchange, but a structured accusation leveled at the suspect, in which both the demeanor of the investigator (calm and understanding) and the behavior of the suspect in response to accusation (which is presented as though there is no doubt as to the suspect’s guilt) are critical. One of the aims of the BAI is to enhance an investigator’s ability to detect lies, deception, and inconsistencies in the statements given by witnesses, victims, and suspects.

### Interrogation

The Reid technique divides interrogation into nine steps that act as a script for the investigator to follow. This script presents the suspect with the

accusation that their guilt is known beyond the shadow of a doubt, and is provable, but the interrogation is actually designed to elicit a confession or other behaviors that will tip the suspect's hand, and is not reserved for occasions when a case is all but solved. A suspect who is known to be an unlikely candidate may well be treated as clearly guilty for the purposes of the Reid technique, and is subsequently eliminated when the suspect's behavior and responses to the interrogation give investigators no reason to treat them with enhanced suspicion.

The suspect is told or otherwise caused to believe that the evidence in the case led directly to them, and that he or she is being offered the opportunity to explain him or herself. Circumstances that might have justified the crime, regardless of whether they have any legal bearing on a prosecution, are forwarded in an attempt to craft a narrative that the suspect either confirms or denies. Opportunities to deny guilt are curtailed whenever possible on the belief that a confession is easier to obtain if the suspect is not asked, by the act of confession, to directly contradict an earlier assertion of innocence. Until a confession is obtained, the Reid technique encourages the investigator to do most of the talking, essentially floating and abandoning various narratives until the suspect positively responds to one, at which point the confession is recorded in some form later admissible in court.

The Reid technique has been challenged as too likely to lead to false confessions. The objection is principally to its structure and the way that it leads the suspect. For this reason, the use of the technique on young offenders and children is banned in some countries (though not the United States) out of concern that they are too impressionable and that too many wrongful convictions have resulted. Critics consider the Reid technique coercive, confrontational, and psychologically manipulative, especially when used earlier in an investigation when the body of evidence may still be developing.

### Employment Applications

John E. Reid and Associates offers a variety of services similar or related to its BAI. It administers polygraph examinations on behalf of law enforcement agencies and businesses in the

private sector throughout the country, conducts telephone interviews on behalf of businesses following up on consumer complaints, fraud investigations, or other concerns, and consults on interviews, interrogations, and background checks. The integrity interview, like the BAI, is a structured interview, but is designed for job interviews rather than criminal investigations, with an eye to discovering and discussing the applicant's past behavior patterns on the theory that past behavior indicates future behavior. Specific areas investigated include employment history, theft and other crimes, work-related drinking, drug use, company policy violation, and criminal behavior.

The Computer Employment Application (CEA) is a software package for administering interactive job applications for jobs in positions of trust, whether as law enforcement personnel (the traditional Reid and Associates clientele) or private sector positions of authority or in sensitive positions. The CEA delivers follow-up questions and asks for amplifications and clarifications based on applicants' responses, and is designed to be the first stage of a job application process, weeding out inappropriate or undesirable applications while minimizing application fraud with a minimal investment of face time or man hours.

The Reid Institute was established by John E. Reid and Associates in 1999, and is open to all graduates of Reid technique seminars. Through the institute, investigators may take advanced Reid technique seminars and work toward the Certification in the Reid technique (CRT). Seminars cover special topics such as the interviewing of children or witnesses who have experienced trauma and court decisions that impact the admissibility of confessions.

## Betrayal

Betrayal occurs when a social actor violates an established rule or expectation underlying cooperative behavior. Social actors can be thought of as individuals, entities such as organizations, or even nation-states. Social actors cooperate with each other to accomplish a wide range of goals. In personal relationships, people depend on each other for caregiving and social support, companionship and affection, and sexual gratification and reproduction; people even rely on each other for the formation of personal identities—that of a parent, lover, or friend. In professional life, people work in collaborative teams and/or the work they do is contingent on other people’s contributions. From a societal point of view, complicated tasks such as organizing and maintaining a system of government, and mundane tasks such as walking down a bustling street, both involve complex patterns of cooperation.

### Expectations and Cooperation

Cooperation, however, requires shared expectations. In order to receive the benefits of working together, people must operate by an established set of rules and norms. Social contracts, which indicate everyone’s responsibilities, must be negotiated to achieve cooperation.

The expectations that underlie cooperation can be directly negotiated, in an explicit manner. For instance, at a societal level, some people’s

expectations are written into law. In professional life, organizations often spell out explicit policies outlining appropriate codes of conduct. In close relationships, partners can make their expectations clear by establishing specific rules about the types of behavior that are acceptable within their relationship.

Expectations underlying cooperation can also be established through more indirect means and can be implicit in nature. Implicit norms are acquired through a variety of methods, including socialization processes such as modeling other people’s behavior, the use of rituals, the telling of stories, or through direct experience with others. For example, through repeated interaction, people can indicate to others what is desired without articulating their specific expectations. If a spouse comes home from work later than expected, their partner may not explicitly address this issue, but rather signal their displeasure through nonverbal displays of disapproval or anger. Through socialization processes and repeated experiences, people implicitly learn what is expected of them across a variety of different situations. Most of the time, implicit norms or expectations operate in the background—outside of conscious awareness. For instance, people are not typically aware of the rules for riding in an elevator, but people nevertheless tend to follow the rules. Again, from a larger societal perspective all the way down to interpersonal relationships, cooperation is possible because people establish and adhere to an elaborate set of norms and expectations.

Although some of the norms that people establish are universal, such as the notion that kindness should be met with kindness, many of the expectations that people place on each other are influenced by one’s culture, group memberships, relational experiences, and personality differences. For instance, in some cultures, the expectation for sexual fidelity in a romantic relationship is less important than in other parts of the world, where infidelity can result in severe forms of punishment. At the individual level, people vary with respect to the expectations that they place on others, especially within their close relationships. Some individuals set unrealistic expectations about an intimate partner’s behavior, including the belief that a partner should always be available and always know exactly what the other person is thinking.

As a general rule, people establish more unique and idiosyncratic expectations as relational intimacy increases. While a wide range of both implicit and explicit norms underlie cooperative behavior, individuals' expectations become increasingly complex as they become more emotionally involved and interdependent. People tend to place more expectations on a spouse than a next-door neighbor.

Because people live under such a complex set of social expectations, especially in their close relationships, it is difficult for individuals to always live up to the expectations that have been agreed upon. Sometimes people lack the motivation to behave according to the norms that have been established. At any given moment, an individual's desires or wishes may run counter to what is expected. Sometimes people lack the ability to keep all of the promises they have made. People can also experience conflicting expectations, where one set of expectations may directly conflict with another set of expectations; for example, the common conflict of needing to put in long hours at work, while also trying to meet the expectations involved with being an attentive spouse and/or parent.

### When Betrayal Occurs

A betrayal occurs when a social actor violates established, cooperative, implicit, or explicit norms within a given relationship. By this definition, betrayals can occur within personal relationships, between organizations, and between individuals and organizations, just to name a few. Across all of these different types of betrayals, the basic dynamic is the same: Betrayal involves an actor's disregard for following pre-established expectations. An act of betrayal calls into question the basic rules by which people cooperate with each other.

The consequences of not meeting established expectations depends on a variety of factors, including the importance of the specific rule that was broken, as well as the nature of the relationship in which the violation occurred. People who have been betrayed often experience negative emotions, view the other person in a different light, and react by expressing their disapproval or engaging in some form of distancing and/or punishing behavior.

Given the negative consequences that can occur for failing to meet cooperative expectations, social

actors often try to conceal what they have done. Deception is frequently used to cover up such shortcomings. People cover their mistakes by explicitly lying about what happened and/or by deliberately failing to disclose the relevant information. For the most part, acts of betrayal are followed by deceptive attempts to conceal the truth.

There is a risk involved when trying to use deception to cover up the violation of an established expectation. For the most part, people expect others to be forthright and honest. Therefore, concealing an initial betrayal can be viewed as engaging in an additional act of betrayal. Furthermore, if the initial betrayal was unintentional—a mistake made in a moment of weakness—it is more difficult to argue that the cover-up was unintentional.

Discovered betrayals can produce intense, negative emotions, including anger, disappointment, shock, sadness, loss, and increased uncertainty. Discovered betrayals also result in a cognitive reappraisal of the self, the perpetrator, and the relationship in which the betrayal occurred. People often express their anger and disappointment, attempt to punish the betrayer, and in some cases terminate the relationship altogether.

Reactions to the discovery of betrayal are influenced by a host of factors, including the specific nature of the rule that was violated, the closeness of the relationship, the potential consequences or loss experienced, the intent of the perpetrator, the method of discovery, and the relational history between the parties. People react more strongly to discovering betrayal when important expectations are violated and the betrayal involves serious consequences, especially in close relationships, and when the violation appears to be intentional in nature.

Because discovering betrayal results in a loss of trust—that is, the awareness that another person has put their interests ahead of mutually negotiated expectations—it can be difficult for people to recover from a betrayal. Recovering from an act of betrayal requires cooperating with an individual who has just revealed that he or she is willing to violate norms of cooperation. Factors that influence whether individuals can repair a relationship after the discovery of a betrayal include the degree to which individuals were satisfied with the relationship before the discovery of the

betrayal, the importance of the rule that was violated, the specific consequences that were incurred by the betrayal, whether the betrayal was an isolated incident or part of a reoccurring pattern of behavior, the method by which the betrayal was discovered, the perceived intent underlying the perpetrator's actions, the amount of investment people have put into the relationship, the remorse or willingness of the perpetrator to make amends, and the degree of willingness on the part of the victim to work through a resolution and reestablish trust.

The book provides laws, parables, and principles about deception that have served as a guideline for generations. The complex legal code developed within the Bible returns to this prohibition time and again. The Bible also features stories of deception, evasion, manipulation, and self-deception, all of which conclude with lessons that these actions are discouraged because of their consequences. The books of Psalms and Proverbs feature several verses regarding the offense of lying and how people should strive to avoid it. For thousands of years, the Bible's moral tradition has instilled in its readers the attitude that deception is wrong.

The Hebrew Bible has served as the foundation for the Abrahamic religions: Judaism, Christianity, and Islam. Academic sources indicate that it was written between 1200 and 100 B.C.E., with the latter texts progressively added until it was developed into a full canon. Based on the discovery of several ancient versions of the text, including the recent uncovering of the Dead Sea Scrolls, the Bible is said to have reached its current edition around the 2nd century C.E. It is almost completely written in Hebrew, aside from several passages in Aramaic, which is the language that the Jews adopted once Hebrew became phased out as their colloquial language through the Diaspora.

Because the Bible has influenced many different societies, its impact on beliefs about deception is massive. The canon contains the stories of Creation, the Patriarchs, and Moses; the giving of the Torah, the religious and legal code that the Israelites were told to follow; a historical look at the Hebrew nation as it conquered and settled Israel and developed its religious framework; and poetic and theological texts. Together, these scriptures have influenced the followers of these religions in several aspects because of the diversity of their text. Literature, law, cultic practices, and history can all be derived from the writings within the Bible. Because of the canon's multifaceted nature, its outlook toward deception has pervaded the attitudes of its followers since it was written. Traditional Jewish methods of biblical analysis set the precedent for future religious interpretation, particularly in how moral lessons are derived from the law, principles, and parables.

---

## Bible

The Bible has served as the moral foundation of many societies, and it contains several references regarding the moral aspects of deception.

## Law

The most explicit law forbidding deception is the eighth commandment, “You shall not bear false witness against your neighbor” (Exodus 20:16; Deuteronomy 5:20). The Ten Commandments are seen as a foundational list of absolute moral rights and wrongs, more so than any other law or story in the Bible. Because the Bible has been used both as a legal code (in ancient Jewish civilizations as one of the earliest known legal codes in the world) as well as the basis for other legal codes, this law has served as the moral impetus for the heavy weight of the crime of false testimony. The ancient understanding of the law was that false testimony is a sin against God, but modern interpretations regard it as a general warning against lying and deception.

Deception researcher Dan Ariely has used the Ten Commandments to establish a moral context in his subjects’ minds. He considers religion to be a social mechanism, and while it evolves over time, its tenets are intuitively important and pervasive enough to be used as moral framework.

## Principles

The poetic Book of Psalms has several verses regarding the offense of lying: “Save me, O LORD, from lying lips and from deceitful tongues.” (Psalm 120:2); “Let their lying lips be silenced, for with pride and contempt they speak arrogantly against the righteous.” (Psalm 31:18); “Remove from me the way of lying: and grant me thy law graciously.” (Psalms 119:29); “He . . . who has not . . . sworn deceitfully. He shall receive the blessing from the LORD.” (Psalms 24:4–5); “. . . the mouth of them that speak lies shall be stopped.” (Psalms 63:11); and “He that works deceit shall not dwell within my house: he that tells lies shall not tarry in my sight.” (Psalms 101:7). Similar verses can be found in the Book of Proverbs: “Lying lips are abomination to the LORD: but they that deal truly are his delight.” (Proverbs 12:22).

## Parables and Stories

The Bible’s stories depict human nature and desires. Moral lessons are often extracted from the text for religious reasons, but the stories can serve many purposes. The Bible is one of the earliest forms of writing to closely describe through

stories humankind’s innate deceptive dispositions, and the potential consequences if people succumb to them. Other forms of allegorical literature also follow this model: Greek classics; folklore, fables, and parables; and fairy tales. The risks that society associates with deception are rooted in how the Bible treats these actions, and other parables in history tend to similarly treat deception.

Stories of deception featured in the Bible often serve a moral lesson. Many are taught to young children in order to provide a foundational understanding of the consequences of deception. A commonly referenced story is Isaac’s blessing to his firstborn son (Genesis 27). Isaac’s sons Jacob and Esau were twins, but Esau was born first, and thus owed a blessing as part of his birthright. Rebecca, their mother, wanted Jacob to receive the blessing, so she encouraged Jacob to convince Esau to exchange a bowl of stew for the right to the blessing. Rebecca cooked Isaac’s favorite meal and helped Jacob plan an elaborate

*Johannes Sadeler I's engraving, Jonah Thrown to the Whale, circa 1582, depicts the end of the line for the prophet Jonah's deception, both to God and to the sailors. In the biblical Book of Jonah, the prophet used evasion as a way to avoid the truth.*

disguise involving wearing Esau's clothes and fur on his hands to make him appear as hairy as Esau. Isaac's eyesight was already poor, so the disguise was intended to fool Isaac into thinking that Jacob was Esau. Jacob explicitly lied to his father, saying that he was Esau, though between the disguise and the voice, Isaac was confused: "The voice is Jacob's voice, but the hands are the hands of Esau!" (Genesis 27:22). Isaac gave Jacob the blessing, leading to a lifetime of strife between Jacob and his brother Esau. Among other lessons, this story has traditionally been used to show that deception undermines relationships.

A story of deception concerning Jacob is also told in Genesis 37. Jacob's sons sold one of their brothers, Joseph, and lied to Jacob about what they had done. The brothers hated Joseph because he was treated as special compared to the others. They threw Joseph in a pit and then sold him to some Ishmaelite passersby. To cover their crime, they took Joseph's multicolored coat, a special gift from Jacob, and dipped it in blood. They brought it to Jacob as a sign that Joseph had been savagely killed. The roles of the brothers of the family are then reversed in Genesis 42–45, when Joseph is living as a governor in Egypt. Famine in Canaan brought the brothers to Egypt to seek food, and they unknowingly came to Joseph. "Joseph saw his brothers and recognized them, but he acted as a stranger to them" (Genesis 42:7). He accused them of being spies, only revealing himself as their brother after a long saga. Similar to the story of Jacob and Esau, this story is often taught as a warning to protect familial connections from deception.

The Bible suggests a more approving stance toward deception when it is necessary for personal survival. Genesis 12 tells of husband and wife Abraham and Sara, who sought refuge from the famine in Canaan. They came to Egypt and approached Pharaoh's palace, where they were worried that Sara would be taken as a wife for Pharaoh. If this were to happen, Abraham would be killed because he was her husband. Thus, Sara lied and claimed to be Abraham's sister so that when Pharaoh took her, Abraham's life was spared. When Pharaoh took Sara, God became enraged and plagued him, showing his disapproval. Pharaoh then realized that Sara and Abraham were husband and wife, and made

them leave Egypt. This scheme is repeated twice more in the book of Genesis: once again by Abraham and Sara, and then by their son Isaac and his wife Rebecca. All of these deceptions were essentially true: in these societies, married partners tended to be related. Allan Turner argues that they were just concealing the truth of their marriage while honestly conveying the fact that they were siblings. To cover up the truth is simply a method of deceiving through misleading rather than lying.

Thus, deception comes in many forms, not always directly as lies. Theories of deception include evasion, manipulation, and self-deception as ways to mislead people by disregarding the truth. All of these can be found in stories in the Bible, and are accompanied by moral implications, most likely that whoever wrote them disapproved of such actions.

### **Evasion, Manipulation, and Self-Deception**

Evasion is a way to avoid the truth in order to fool people. The story of Jonah the prophet's evasion of God is found in the Book of Jonah. God ordered Jonah to visit the city of Nineveh, where there were many sinners, and preach against it. Instead, Jonah ran away and hid from God. He first boarded a ship to escape, but he was thrown overboard by the crew. The boat had hit a storm, and the sailors decided that it was caused by God's anger toward Jonah's evasion. A fish finally swallowed Jonah for three days after he was thrown into the water. Humbled by what had transpired, Jonah went to the city and prophesied as originally intended. This act of evasion is a classic story teaching that it is both wrong and impossible to escape one's obligations. That Jonah was found out and held responsible for his actions proved that God cannot be "fooled" into being disobeyed.

Manipulation makes use of tools or information at one's disposal to control others' actions or beliefs. Genesis 3 contains a classic story of manipulation about Adam, Eve, and the snake, in which the snake misleads Eve into consuming the fruit of the Tree of Knowledge, previously forbidden to her and Adam by God. Eve in turn convinces Adam to also eat the fruit. Once Adam and Eve consumed the fruit, the fate of humankind forever changed when they, as well as the

snake, receive curses. The snake traditionally has been abhorred for its characteristically deceptive nature. Eve has also been criticized for self-deception: that is, the act of misleading oneself, which is often a means of accommodating one's conflicting desires or intentions. Eve succumbed to the snake's tempting offer, despite knowing that it was forbidden. This is one of many examples of cognitive dissonance (holding two conflicting ideas or values) in the Bible. Characters often have to choose between personal desires and what is commanded of them by God or needed from the community.

Self-deception is not only found within the stories of the Bible; it might also be a consequence of commitment to Biblical texts. Because the Bible is so subject to human interpretation, it has often been used to serve drastically different agendas by delving into more complex levels of understanding. Jewish tradition teaches concepts regarding depth of interpretation. The Hebrew word *P'shat* (or *Peshat*) means the simplest or base understanding of the text, which can be derived without any other tools of interpretation. Society, though, moves far beyond the *P'shat* of the text to draw new meanings. Without knowing the actual intentions of the authors of the Bible, it is impossible to say if the reasons these people used it were loyal to its original purpose.

Because the Bible is so central to the Christian-influenced first world (as well as any region influenced by the Abrahamic religions), the assumption that this is the sole text that has dictated moral values to the rest of the world is an oversimplification; there are many societies in which the Bible is completely unknown. However, because the text was foundational as a legal code, there are notes of its influence in many subsequent legal codes. The Bible was received in Judaism's early days as a more modern, nuanced religious text than most other religions had the capacity for. Religion at the time was cultic: iconic imagery and idolatry were the mainstream beliefs, and people worshipped multiple gods. The Bible dictated a new religious order, commanding that God be worshipped as the only god, and all of the cultic practices were forbidden. Along with the new sacramental practices came a tone about the moral progress made by this new society of Hebrews. And despite thousands of years having passed to

allow for even more moral advancement, much of the Bible's emphasis on ethical principles remains the same. Among these principles is the rejection of deception; it may not be an exclusively Judeo-Christian tenet, but it has been carried out through religious practices and tradition through the Bible.

## Big Lie Technique

Originating in Germany during the rise of the National Socialist (Nazi) Party, the Big Lie is the practice of telling a lie so profound that the general public will not believe that someone would fabricate such a falsehood and, as a result, will accept the lie as truth. The origins of the phrase can best be traced back to Adolf Hitler's 1925 autobiography *Mein Kampf*. Retrospective studies of governmental propaganda have shown that big lies often have more influence over individual opinion than smaller ones. Thus, some governments still utilize the Big Lie technique today.

The Big Lie can be seen as an extension of Plato's "noble lie" described in *The Republic* in the 4th century B.C.E. Plato proposes that the noble lie is one that serves the purposes of advancing

a society and its goals, regardless of whether it is true. The definition of Big Lie, as it is known today, is sometimes falsely credited to Joseph Goebbels, the Nazi minister of propaganda, who said, "If you tell a lie big enough and keep repeating it, people will eventually come to believe it." The origins of this quotation are unknown, and Goebbels never admitted to using the Big Lie technique, for admitting the lie would counteract its effects. Rather, in his 1941 article "From Churchill's Lie Factory," he accused Winston Churchill of using the Big Lie tactic, stating that Churchill repeated his lies until he believed them.

The first mention of Big Lie propaganda actually appears 16 years earlier in *Mein Kampf*. Like Goebbels, Hitler never admitted to using the Big Lie technique, but accused the Jewish population of using it. However, Hitler detailed how such propaganda should be used. He stated that propaganda should be directed toward the uneducated masses in such a way as to convince them that all of the information presented to them is fact. Hitler argued that the delivery of propaganda must be psychologically correct.

At no point did Hitler recommend fabricating the propaganda. Instead, he blamed the German collapse on the Jews' use of fabricated Big Lie propaganda. Hitler elaborated that individuals are used to telling small lies, and thus are not surprised by the use of small lies in others. However, individuals, being more corrupt than purposely evil, would be properly ashamed by telling a big lie. Because they would not engage in such purposeful falsehood, they in turn are unlikely to believe that others would be capable of such "monstrous effrontery and infamous misrepresentation."

Beyond mere persuasion, Hitler accused his opponents (namely Jews, but also Americans and the British) of expertly using propaganda as psychological coercion. Hitler explained that propaganda should focus on emotions, rather than logic. In 1933, Hitler established the Reich Ministry of Public Enlightenment and Propaganda to spread Nazi propaganda throughout Germany. It is easy to see the technique of the Big Lie put to full use in the Nazis' creation of propaganda.

Many argue that all communication is some form of persuasion, and that the difference between the terms *education* and *propaganda* are simply a choice of words. Propaganda, originally

a neutral term, is now so closely associated with warfare and Nazi propaganda that it is largely considered negative. Most sources today define the differences between propaganda and education based on purpose and source. Education is persuasion based on truth and engaged in for the betterment of the target of the education. Propaganda is persuasion based on misrepresentations and half-truths and engaged in for the betterment of the source of the propaganda. Propaganda is the act of spreading information to some large audience in an effort to persuade or unite the public under some common goal. Propaganda often omits certain facts or misrepresents the truth in some manner. While discussion of propaganda and psychological warfare was abundant in the 1940s and 1950s, interest in the subject has declined over the years.

### Effectiveness of the Big Lie Technique

Small-scale studies have examined the effectiveness of the Big Lie technique used by individuals in bargaining; it was shown that the more extreme the lie, the more successful the bargain was for the liar. Unlike propaganda, however, repetition of the lie yielded no effect on the outcome because this study dealt with the individual, not a population. An imposed opinion (such as Big Lie propaganda), when compared with opinions held by individuals prior to being subject to outside influence, has a greater impact based on the degree that the lie differs from the individual's personal opinion. This can explain why Big Lie propaganda is so effective: Individuals, on average, shift their personal opinion a greater degree after they are influenced by an opinion drastically different from their own. Additionally, over time, individuals will tend to shift their opinion to group norms.

For the Big Lie to work, the perception that it is accepted as truth is more important than whether it actually is true. Part of the technique is convincing a populace not only of the lie but also that the lie is accepted by the group. The decision making of a group influenced by propaganda can be compared to groupthink. Groupthink, as explained by Irving Janis, is the phenomenon in which each individual's decision-making process and moral judgments deteriorate, or are pushed aside, in order to conform to group pressure. Individuals in groups will feel social pressure to conform,

which can lead to groupthink. An individual disagrees with the group's decision, but at the same time perceives that everyone else agrees, and thus, feeling isolated, agrees with the group as well.

The Big Lie technique has also been used by the People's Republic of China, North Korea, and the Soviet Union in the early 1950s. China, in particular, claimed that Americans dropped diseased insects on the country in approximately one-third of the country's press space and radio time. After the Japanese defeat in World War II in 1945, the Chinese Communist Party claimed that Japan had killed 1.75 million Chinese; by 1995, the number had inflated to 35 million. China currently implements the Big Lie technique in covering up or manipulating its own history, such as the famine that plagued the country from 1958 to 1961, and again in the mid-1970s.

Communist nations are not alone in their use of the Big Lie technique. Recently, in the United States, former president George W. Bush was accused of using Big Lie propaganda in initiating the Iraq War by claiming that weapons of mass destruction were located in the country. Nearly every government or organization uses propaganda in an attempt to gain support and achieve its goals. The psychological operations division (PSYOP) of the U.S. military is specifically devoted to spreading pro-American propaganda in the United States and other countries. However, the act of spreading a simplified truth versus spreading an outright lie separate traditional propaganda from Big Lie propaganda.

## Birds

While most deception research in nonhumans to date has focused on primates, research on complex cognitive behavior in birds dating back to the early 20th century has provided evidence indicating the presence of deception. While the existence of deception in birds is still contentious, alternative explanations for the function of certain behaviors have not been as well supported. Of the possibly deceptive behaviors in birds, those that have received the most academic support are: mimicry, brood parasitism, extra-pair copulations, injury-feigning, false feeding, false calls, and withholding information. A deceptive behavior is one performed nonrandomly by an actor that causes a receiver to react inappropriately in the given situation at a cost to the receiver and in a way that benefits the actor.

### Mimicry

Mimicry, a basic form of deception, is apparent in 15 to 20 percent of avian species. In almost all cases, the mimicry is vocal—birds are known to reproduce the sounds made by other avian species, other animals, and even human-made objects. Well-known mimics include parrots (Psittaciformes), the northern mockingbird (*Mimus polyglottos*), and drongos (Dicuridae). While no single function has been determined for such accurate vocal mimicry, some species, namely within the drongo family, appear to deceptively use this ability. Birds have been known to mimic calls of other bird species in order to attract individuals of that species to assist in mobbing a predator or to aid in foraging. It is argued that birds that produce accurate mimetic vocalizations in appropriate contexts are acting deceptively because the calls affect others in ways that benefit the caller. Alternatively, if birds randomly produce the calls, regardless of context, they are not behaving

deceptively, even if their calls occasionally impact the behaviors of others in a way that benefits the caller. The context of mimetic calls must therefore be studied to determine if they are a true example of deception.

### Reproductive-Related Deceptions

Related to mimicry is brood or social parasitism, most common in the cuckoo (Cuculidae), cowbird (Icteridae), and honeyguide (Indicatoridae) families. Brood parasitism is a reproductive strategy in which individuals of one species (the parasites) lay their eggs in the nests of another species (the hosts), leaving the host to raise the parasitic young. It is a prime example of coevolution because the hosts gradually evolve strategies to detect parasites while parasitic eggs evolve to look increasingly similar to eggs of the host, limiting the number rejected. The young of some species even mimic the begging calls or plumage of the hosts' young. If the parasites are not detected, the young of the hosts are typically killed. Nestlings of certain parasitic species have concave backs to push host young from the nest and specialized bill hooks to kill them, or they simply outcompete them by eating all the food that the adult hosts provide. In other parasite species, the adult will eject the eggs of the host as it is laying its own. Brood parasitism severely impacts the reproductive success of the host while benefiting the parasite.

Another form of deception that impacts reproductive success, extra-pair mating, has been reported in at least one species in nearly every avian family. The term applies only to bird species that pair bond, and has been well studied in the pied flycatcher (*Ficedula hypoleuca*) and great reed warbler (*Acrocephalus arundinaceus*). Extra-pair copulations occur when an individual mates with another who is not its social pair. Males have been known to mate with a first female and attempt to attract a second after she has laid her eggs. Some species, such as the pied flycatcher, achieve their deceptive polygyny by defending multiple territories, known as polyterritoriality. After its mate lays eggs, the male will establish a second territory from which to call. Species such as the great reed warbler, on the other hand, defend large territories, and will call to attract a secondary female from a location far away from

their mate. Whatever the method, extra-pair copulations can be called deceptive only if researchers are able to ascertain that the secondary female is not aware of the male's mated status. Extra-pair mating has been shown to reduce the breeding success of the secondary females that are left to raise the young alone while benefiting the male by increasing his fitness.

In order to improve reproductive success, nesting birds of many avian species use distraction displays as part of their behavioral repertoire when confronted by predators. While most displays are not considered deceptive, injury-feigning has been thoroughly studied and is believed by many to be an example of tactical deception. Injury-feigning, used most notably by plovers (Charadriidae), refers to birds acting in a way consistent with injury (such as fanning the tail, dragging one or both wings, and walking awkwardly) in front of a predator, apparently to lead the predator away from their nest. However, birds do not feign injuries in front of large animals that are not a direct threat to their young, that is, those who may accidentally trample eggs but would not eat them, suggesting that injury-feigning is not simply a natural response to animals approaching the nest but is deliberately used in appropriate contexts. This behavior appears deceptive because the birds move first to a location where the predator will see them, and then continue to move away from their nest while appearing to monitor the response of the predator. They will even fly back and repeat their actions if the predator does not follow.

While the young of most species are solely raised by a mated pair, cooperative breeding, in which more than two individuals are responsible for raising a single brood, occurs in approximately 3 percent of birds and allows for another potential deception—false feeding. A deceptive helper may go to the nest with no food, give nestlings only part of what it holds in its crop, or only pretend to feed the nestlings before eating the food itself. White-winged choughs (*Corcorax melanorhamphos*), laughing kookaburras (*Dacelo novaeguineae*), and carrion crows (*Corvus corone*) engage in false feeding. False feeding benefits the deceivers because they do not lose food, yet they still appear helpful to conspecifics (members of the same species) that

may otherwise punish them. It is likely that this behavior is an example of deception because it occurs most often when the cheater is alone at the nest and, if the cheater is caught, it is punished by the group.

### Calling and Caching

Another behavior in which duplicity is common is calling. Various birds use false alarm calls because the high cost of not responding to an honest alarm call generally causes animals to respond before they receive evidence of the call's veracity. False alarm calls are typically utilized in competition over a resource because they are safer to the caller than a threat display, which may lead to a physical altercation. False calls are considered deceptive because they are used when the situation does not apparently require them (i.e., an alarm call when no threat is present) and they benefit the caller in some way. Despite their low-risk and large benefits, false calls are naturally controlled because they will become ineffective if overused—conspecifics will stop responding to both honest and dishonest versions of the call.

Perhaps the most complex example of deception is practiced by members of the corvid family (Corvidae), which includes crows, ravens, rooks, jays, and magpies, regarded as the most intelligent of all avian species, with the possible exception of some parrots. Many corvids temporarily cache surpluses of food for later. Their high intelligence allows them to remember a great number of cache locations, and they are even capable of remembering locations where conspecifics have cached food. Therefore, an individual's cache may be raided by conspecifics, and corvids appear to prevent this raiding by manipulating the attention of others, primarily by withholding information. They choose to cache in areas with few or no conspecifics nearby, cache behind objects, delay caching, create false caches, and may even change cache locations. Research has shown that corvids often recache only if it is likely that a conspecific witnessed their initial hiding location, indicating that this behavior is not random.

This is a complex form of deception because the behavior depends on an individual bird's understanding what conspecifics can or cannot see and adjusting its behavior appropriately to prevent the others from learning its cache locations.

### Conclusion

Many behaviors performed by different avian species may be examples of tactical deception. Although other explanations are offered, deception remains the most likely function for mimicry (in certain species), brood parasitism, extra-pair copulations, injury-feigning, false feeding, false calls, and withholding information during caching. In all cases, the deceiver benefits from its actions and seems to utilize the behavior only when appropriate. Further research is necessary to determine whether these actions can definitely be attributed to deception.

## Blair, Jayson

In 2003, the *New York Times* revealed that one of its reporters, Jayson Blair, had fabricated and plagiarized material in many of his stories. The mea culpa came in a more than 7,000-word article that began on the front page of the newspaper. According to the publication's apology, "The widespread

fabrication and plagiarism represents a profound betrayal of trust and a low point in the 152-year history of the newspaper, the 23-year-old reporter had severely tarnished the reputation of one of the country's top newspapers.

An investigation into the stories that Blair wrote found that he had often pretended to travel to places to interview sources but never made the trips. This was a violation of the *Times*' policy on "dateline integrity." Blair fabricated details and copied the quotes included in stories written by reporters for other newspapers. The stealing of quotes led to his downfall when a reporter at another newspaper noticed them. An investigation proved that Blair had a lengthy history of fabrication and plagiarism.

### Charging Ahead

Blair's rise to a reporting position at the nation's top newspaper was swift. He was a journalism student at the University of Maryland when he began to stand out as a driven reporter. His fellow classmates at the school's newspaper, *The Diamondback*, later noted that this was also when he began lying and making mistakes.

While reporting at the student newspaper, he exceeded the number of corrections that were allowed. Yet, after only one semester at the publication, he applied to be an editor. The staff supported another student, although an outside board chose Blair for the job.

As an editor, Blair continued to make mistakes, and was chronically unreachable. He would miss deadlines and make up stories. In one example, he did not return to the newsroom after saying that he was making a quick trip back to his apartment. The next day, he reappeared and announced that he had almost died the night before when the kitchen gas stove was left on; he was saved only when a roommate woke him up. Curious, one of the students made calls to campus housing and learned that there were no gas connections on the campus.

Despite the warnings about Blair's journalistic errors and deceptions, Blair was chosen for top internships. In 1996, he interned at the *Boston Globe*'s Washington, D.C., bureau, and he returned the following summer to the newspaper's Boston offices.

In the summer of 1998, Blair landed an internship with the *New York Times*. He returned to

intern at the newspaper the following summer. At this point, he had one year of college coursework left at the University of Maryland. He never earned a college degree.

At the *Times*, he continued to make errors. At one point, he told editors that he was having problems because of the death of a cousin at the Pentagon during the terrorist attacks on September 11, 2001. It was later learned that Blair had fabricated the cousin.

In April 2002, *Times*' Metropolitan Editor Jonathan Landman issued a memo recommending that Blair no longer report for the newspaper. Blair took a brief leave from the newspaper and, rather than being punished, was awarded with a top story—the Washington, D.C., sniper case. He was not questioned when he used anonymous sources for important information.

Some publicly questioned if Blair would have made such errors of judgment if he had spent more time at smaller papers and climbed the ladder like most reporters. Others noted that because Blair was African American, his race may have played a role in being hired so young and receiving extra chances after he had repeatedly erred.

A reporter at the *San Antonio Express-News* ultimately exposed Blair's deception. Macarena Hernandez noted how similar one of Blair's stories was to one that she had written. She checked with the subject of the story, learning that Blair had never interviewed her. She soon made a call to the *Times*, where she had previously interned with Blair.

After the *Times*' editors were notified of Blair's stealing quotes, an investigation was instigated. Five reporters and three editors spent a week verifying information that Blair had submitted from October 2002 through his resignation on May 1, 2003. They found problems with 36 of the 73 stories published. In a brief review of the other 600 stories he had written earlier, more fabrications were discovered.

In the aftermath, Blair signed a six-figure book deal. The book, *Burning Down My Master's House*, was panned by critics and sold poorly. More than 200,000 copies were published, but in the first nine days of sales, only 1,400 books were sold.

The fallout from Blair's actions was swift. A meeting was held and grievances were aired about how he had been protected. *Times*' Executive

Editor Howell Raines and Managing Editor Gerald Boyd resigned soon after because of the fallout from Blair's actions.

The scandal led to crackdowns at newspapers across the country, where editors demanded more information about sources. Journalism schools included Blair's story as a cautionary tale about lapses in journalism ethics.

Blair's name is often mentioned along with other journalists who fabricated information, such as Stephen Glass at the *New Republic* and Janet Cooke at the *Washington Post*. In Cooke's case, she was forced to return her Pulitzer Prize when it was revealed that she had lied about information in her award-winning story.

## Bluffing

Bluffing can be delineated from lying in general in that bluffing typically involves attempts at making someone believe something that is not true by virtue of displaying false confidence in one's position. This confidence can be either heightened, such as when an individual tries to convince someone of the strength of the individual's position; or deflated, such as when an individual

attempts to convince someone of the weakness of the individual's position.

Bluffing often entails the presentation of misinformation vis-à-vis the manipulation of attractive alternatives and/or information. That is, one may obscure the range of behavioral options available to another person by making some options seem more costly or less attractive. For example, a meek woman who is threatened by an attacker may bluff her opponent by standing tall and taking a fighting stance in the hope of prompting her attacker into thinking that the costs are too great to pursue his aggressive behavior.

Another differentiation from lying is that typically the person being bluffed has the (sometimes unknown) advantage of time and/or the ability to "call" the bluff. That is, usually over time, the bluffer's true position is revealed, as in the case of a poker hand. Also, the person being bluffed can always "call" or ask the bluffer to present proof of his or her false assertions and, unlike a lie, this proof is required to maintain the deception. Research on bluffing has focused on four key contexts: (1) interrogations, (2) sports, (3) bargaining or economic settings, and (4) games of chance or skill.

Police officers employ bluffing as an interrogation method in order to convince suspects that the evidence against them is stronger than it actually is. For instance, the police may lie about finding a particular piece of damning evidence or about the results of a forensic test in the hope of convincing the suspect that the evidence against him or her is particularly strong and that denial is futile. This technique is usually combined with falsehoods regarding leniency, should the suspect make a confession. Here, research has shown that bluffing increases the rate of false confessions. For example, in one study, research participants took dictation while in the presence of a confederate. During the dictation, the computer crashed, supposedly because the participants hit the ALT key (something they were informed explicitly not to do because it would result in crashing the computer). When participants were accused of hitting the ALT key in conjunction with having the confederate serve as an erroneous eyewitness, the rate of false confessions nearly doubled to 94 percent, and of those confessions, 55 percent of participants were convinced that they may have

actually hit the ALT key. Recently, other research has shown that even more subtle bluffs can result in surprisingly high levels of false confessions. Thus, apparently innocent suspects will admit to a crime, hoping that the false or misrepresented evidence will exonerate them.

In sports, the majority of research has focused on detecting or anticipating movement. Being able to anticipate an opponent's movements can give one a strategic advantage in games such as tennis or soccer. Laboratory and field studies have both shown that novices tend to perform worse at detecting the direction of movement than more experienced players. Research in this context typically uses judgments on kinematic movement; that is, attempting to discern direction of movement using videos or point-light displays. However, knowing that anticipation offers strategic advantage, players will often foreshadow false movements to mislead their opponents into thinking that they are taking a direction that they are not. For example, football players will often make a movement to the left (or right), and then advance in the opposite direction to throw off the defending player. Theoretically, the enhanced ability by experts to detect movement direction should extend toward detecting deceptive movements. Research supporting this hypothesis, however, is mixed and may depend on the sport. Boxing novices outperform experts with fewer false alarms, suggesting that too much expertise resulted in seeing deception that was not there, but expert rugby players were more discriminating of deceptive movements than novices.

In the business setting, research on bluffing has taken two tracks: One looks at attempting to conceal an individual's true position in bargaining, and the other on presenting falsified information to business rivals. In the first line of research, union contracts, car and house sales, and even market haggling all involve the use of bluffing tactics in that all tend to imply that their bottom-line walk-away position is far lower (or higher) than it really is. For instance, labor leaders often start by saying they want a large wage increase or else that they are walking away from the bargaining table. In the second line of research, businesses often mislead others by filing erroneous patents, announcing fictitious new products, or making false alliances. Research in both of these

*John Phan contemplates his strategy at the 2008 World Series of Poker in Las Vegas, Nevada, June 17, 2008. As in the case of a poker hand, the bluffer's true position is usually revealed over time, and the person being bluffed can "call" the bluffer on it.*

areas has focused on the moral permissibility of bluffing in business settings, with scant attention paid to the psychological mechanisms or implications of bluffing.

Bluffing in the context of games of chance or skill typically involves misleading one's opponent into thinking that one's odds of winning are either more or less likely than they actually are in order to secure greater economic or strategic advantage over the opponent. Bluffing in poker has amassed a sizable literature, whereas games of skill such as checkers and chess have received less research attention. Bluffing in poker often entails more subtle forms of deception, such as feigning that one has worse cards than one actually

does; whereas games of skill may often employ false moves to mislead the other player into committing to a desired course of action that is more advantageous to the bluffer.

Bluffing can take many forms and appears in a variety of contexts. Research supports that bluffing tends to be effective, even against experts.

## Bok, Sissela

Renowned philosopher and ethicist Sissela Bok was born in Sweden. She was internationally educated at the Sorbonne, Université de Paris, from 1954 to 1955; George Washington University, B.A. in 1957 and M.A. in 1958; and Harvard University, Ph.D. in 1970. Bok is the daughter of two Nobel Prize winners, Gunnar and Alva Myrdal, and has served on the Nobel Prize board as chair or a member for nearly a decade. She is married to Derek Bok, former law professor and president of Harvard University, and has one daughter, Hilary Bok, who is also a philosopher. In 2012, Bok was a senior visiting fellow at the Harvard Center for Population and Development Studies.

Bok is the author of numerous respected articles and books. Two publications of particular relevance to lying and deception are *Lying: Moral Choice in Private and Public Life*, originally

published in 1978 and reissued in 1989 and 1999, and *Secrets: On the Ethics of Concealment and Revelation*, published in 1982. *Lying* was well received, earning the George Orwell Award and the Melcher Book Award.

*Lying* was particularly relevant when originally published because there were few, if any, modern-day texts focused on ethics and lying. Bok's work provided the first thorough investigation of everyday moral choices, including relevant quotations from philosophers and theologians from earlier centuries. And while there are many current texts analyzing moral choices, *Lying* is still regarded as one of the preeminent sources.

According to Bok in *Lying*, lying is any intentional stated message meant to deceive. This dramatically narrows the topic of lying. Not considered as lying are statements that a person did not create to deceive, statements that the person did not know were false, and all the ways that individuals deceive without relying upon words. Bok's new forward to the 1999 reissued *Lying* addresses this weakness, adding that a more accurate definition of lying exists between two extremes: a false statement deliberately presented as true and anything meant to deceive or create a false impression. This would greatly broaden the definition of lying from the original definition presented in *Lying*, though Bok acknowledges that she has addressed this broader definition in many of her written works since *Lying*.

The Principle of Veracity is a premise developed by Bok in *Lying*, which argues that lies should be given a negative weight; the moral presumption is against lying. This includes white lies and all other lies. Bok's justification is that individuals live in a world that relies on a system of trust, and lies violate that trust; individuals do not have the time to verify all information each time they hear it, thus veracity is a fundamental requirement of the communication system. When a person violates this trust, he or she fails to maintain their part of the societal system, and in so doing takes unfair advantage of others. Furthermore, the liar harms him or herself, creating a future propensity to continue lying, expending energy to create and maintain lies, and creating the possibility to harm the liar's credibility if caught in the lie. Thus, Bok argues, lies are harmful to society, the dupe, and the liar.

However, Bok does not claim that all lies are unacceptable. Instead, she argues that lies should be a last option. She does not offer easy solutions to the question of when it is acceptable to tell a lie but instead offers the “Publicity Test.” This test requires that a lie be acceptable to a general audience of reasonable persons, including persons like the dupe. It is rare that people like the dupe accept being lied to. Thus, before lying, an individual should ask others or imagine how others of all different types would respond and only move forward with the lie if others would approve of its use. This is a difficult task because as an underlying requirement is to remain unbiased while analyzing other people’s actual responses or imagined hypothetical responses.

Applying these premises, the Principle of Veracity and the Publicity Test, Bok analyzed lying in a variety of contexts—for example, lies for the public good, deceptive social science research, and lies to the sick and dying—illustrating the need to address lies in particular contexts. In her most recent forward to *Lying*, Bok addresses additional contexts that she would analyze if the book were written today: stories told by brain-damaged individuals; pathological lying; pleasurable motives for deceit; and brutal, needless, or uncaring truth-telling.

Bok offers a follow-up to *Lying with Secrets*, and though lying and keeping secrets are similar in many ways, Bok offers cogent analyses of context-specific arguments that examine the appropriateness of keeping secrets to point out a fundamental difference. Bok evaluates lies as morally wrong, whereas secrets are morally neutral. This means that while every lie requires justification, every secret does not. Bok notes that this difference is derived from the paradoxical nature of secrets when she says, “secrecy both protects and thwarts moral perception, reasoning, and choice” in her preface to *Secrets*. Thus, instead of arguing for or against secrets, Bok depicts the need to thoroughly analyze every situation in which individuals choose to use secrets, demonstrating when they are appropriate and inappropriate. As in *Lies*, Bok conducts this in-depth analysis via a variety of contexts: corporate secrecy, secrets of state, whistleblowing, and investigative journalism, among others. However, in *Secrets*, Bok does not offer a set of similar premises to analyze each

context; instead, each context is independently analyzed.

In the early 21st century, Bok’s work broadened to include the study of happiness, but her earlier works are a cornerstone in the study of lying and deceit. Numerous book reviews speak to the significance of her work when originally published, and a current reading of the literature on lying and secrets attests to three specific ways that researchers rely upon her work: (1) as a fundamental source for legitimate definitional and conceptual references; (2) as a secondary source for relevant quotes by ancient philosophers; and (3) as juxtaposition, typically in book reviews, to current publications on the topics of lies and secrets. Sissela Bok is viewed as a distinguished ethicist among philosophers, and is accessible to the general public. Her rational arguments and concrete examples encourage people to analyze, not take for granted, situations in which lying and secrets occur.

## Bond, Charles

Charles F. Bond Jr. is a research psychologist specializing in deception and the statistical analysis of data. He is most well known for his meta-analyses of deception detection research and his work on cross-cultural deception.

Bond received his Ph.D. in 1980 from Duke University. He has held faculty appointments at several universities and has been widely published

in psychology and statistics. He moved to India for a year to research cross-cultural deception.

### Three Major Meta-Analyses of Deception

Bond has authored three highly influential meta-analyses of deception detection research. Meta-analysis is a study of prior studies. Statistical conversions are used to make prior findings comparable from study to study, allowing researchers to look for trends and to draw conclusions across large numbers of studies.

Bond's first and most influential meta-analysis of deception detection research was conducted with fellow psychologist Bella DePaulo, published in 2006 in *Personality and Social Psychology Review*. This meta-analysis summarized the results of more than 200 separate research reports, spanning more than four decades of research and just below 300 unique findings from more than 24,000 research subjects. It was a massive undertaking, and it remains the most authoritative and comprehensive summary of the deception detection literature available.

One of the major findings of the 2006 meta-analysis was that across studies, deception detection accuracy averaged just below 54 percent, slightly higher than the 50 percent expected by pure chance. Findings were normally distributed around the cross-study average, with 90 percent of prior findings falling between 45 percent and 62 percent, and 99 percent of all findings either below 68 percent or above 38 percent. The 54 percent accuracy value was statistically better than chance. Thus, the meta-analysis revealed strong, consistent, and compelling support for the idea that deception detection accuracy is slightly better than chance.

The meta-analysis also provided evidence for truth bias. Depending on the statistical approach used, somewhere between 55 percent and 57 percent of judgments were truthful. Presumably, as a consequence, the veracity effect received strong support. Accuracy for truths was 61 percent, whereas accuracy for lies was 47 percent.

The results showed that the slightly better-than-chance accuracy finding was very robust and that several factors made very little difference. It mattered little whether the research used forced-choice dichotomous truth-lie measurement, or whether honesty judgments were scaled.

If anything, the dichotomous measures yielded slightly higher accuracy. It also mattered little if accuracy was calculated as a raw average, or if complex signal detection statistics were used. Different measures correlated nearly perfectly. Differences in communication media made little difference (video, no sound, 51 percent; audio, no visual, 53 percent; both audio and video, 54 percent). Motivated liars (54 percent) yielded about the same degree of accuracy as liars lacking motivation (53 percent). Spontaneous lies (53 percent) and prepared lies (54 percent) produced similar findings.

Watching baseline honest communication first provided little help (53 percent versus 54 percent). The same was true for judge expertise (nonexperts, 53 percent; experts, 55 percent) and interaction (no interaction, 53 percent; interaction between sender and judge, 52 percent; interaction with a third party, 54 percent). Regardless, accuracy was slightly better than chance. The most influential factor affecting accuracy was the size of the study. The larger the study in terms of the number of judgments made, the closer the results to the 54 percent average. Thus, the 2006 Bond and DePaulo study documents slightly better-than-chance accuracy in deception detection experiments, regardless of methodology or an extenuating circumstance.

In 2008, Bond and DePaulo conducted another meta-analysis, which has been less influential than its predecessor, but is equally important and informative. Rather than looking at averages across studies, the focus was individual differences. Individual differences are concerned with how close people are, on average, to the average. In other words, looking at individual differences asks the question, "Are people pretty much the same, or are people different from other people?" With regard to deception detection, the Bond and DePaulo study investigated individual differences in both senders and judges, and differences and similarities in both accuracy and truth bias.

The results of this meta-analysis showed that there are very few differences between judges in their ability to detect deception. It matters little who the judges are in deception detection experiments because everyone performs similarly. In contrast, there were big differences in sender believability. Some people are seen as more honest

and sincere than others, regardless of whether or not they are honest. The individual differences in judge-truth bias and sender transparency lie between the two extremes.

Bond's third meta-analysis with Maria Hartwig, in 2011, combined research on deception detection accuracy with research on cues to deception to explain why people are only slightly better than chance. Two explanations were tested. One was that there are useful cues to deception, but people look for the wrong things; the other was that people use the more valid cues, but even the most valid cues are only weakly linked with actual deception. The findings were consistent with the second explanation. People tended to use more valid cues more than less valid cues, but even the most valid cues involved considerable error.

Besides meta-analysis, Bond has conducted important research on cultural similarities and differences in deception. Perhaps his most interesting and important finding regarding culture and deception was reported in 2006 in the *Journal of Cross-Cultural Psychology*. Bond put together a team of researchers who examined perceptions of liars in 75 different countries around the world. Research subjects were asked, "How can you know when someone is lying?" By far, the most common answer is that a liar will not look another person in the eye. Almost two-thirds of the people surveyed listed gaze aversion as a signal of lying. No other stereotype was close. Gaze was listed as the top response in almost 90 percent of the countries surveyed. The belief that liars act nervous was second (listed by 28 percent of the subjects). Thus, the belief that liars won't look another person in the eye appears to extend across cultures and is widespread.

## Book of Mormon

There are at least two reasons that the Book of Mormon, which several million people consider to be sacred scripture, may be of interest to people who study lying and deception. The first reason is that the Book of Mormon contains many teachings about dishonesty. These teachings, from a book that is subtitled "Another Testament of Jesus Christ," are generally consistent with Christian doctrines about dishonesty. A second reason is that many people who have learned about the Book of Mormon's origins doubt believers' claims about what the book is, and where it came from. To many skeptics, it appears that the Book of Mormon's origins have been extensively lied about by its adherents.

#### Teachings About Lying

Like the Bible, the Book of Mormon teaches that lying is a serious sin. One Book of Mormon prophet states that liars will be thrust down to hell (a place of suffering in the afterlife for those who lived wickedly). The devil, a tempter of human beings and the overseer of hell, is described as the master of sin and the father of all lies. According to the Book of Mormon, the devil not only tempts people to lie but also rules over liars after they die and are banished to hell.

The Book of Mormon makes a distinction between God's true church and other, false churches. One prophecy describes false churches as having lax attitudes toward lying and taking advantage of others, with the implication that honesty should prevail in God's true church. Prophets in the Book of Mormon preach against

various deceptive behaviors and also teach that God is incapable of lying.

Several stories in the Book of Mormon suggest that under some circumstances, a just consequence for attempting to deceive people with false religious doctrines is death. In one such story, a preacher named Nehor is put to death for teaching perceived falsehoods (such as the idea that all of humanity will ultimately be granted eternal life). Nehor is executed in compliance with a law written by a God-fearing and well-respected king. In a second story, a vocal atheist named Korihor, who is also described as a deceiver of the public, is struck permanently speechless during a debate with a high priest. Korihor subsequently becomes a beggar and is ultimately run down in the street and killed. The author of the Korihor story ends the tale by noting that Korihor's death is an example of what can happen to those who try to deceive the public with false doctrines.

### Claims and Doubts About the Book's Origins

The introductory pages of the Book of Mormon identify the book as a volume of sacred scripture similar to the Bible, written by ancient prophets in the Western Hemisphere. (Later pages describe the events in the Book of Mormon as taking place between 2500 B.C.E. and 400 C.E.) The book's introductory pages also describe how Joseph Smith, a 19th-century American, found the book on a hillside near his home in upstate New York. Smith claimed that he found the original book, a set of inscribed plates of gold, with an angel's guidance. In other documents, some of Smith's associates described Smith as finding the plates not with the help of an angel, but with the help of a special stone that granted Smith private visions.

Smith claimed that his translation of the gold plates produced "the most correct of any book on earth." Within a few years, he established the Church of Jesus Christ of Latter-day Saints (or LDS Church) and described himself as a prophet. Some of Smith's modern followers in the LDS Church and several offshoot churches accept Smith's claims about the Book of Mormon's origins in their entirety; others value the Book of Mormon's religious teachings while doubting the book's historicity. People who reject Smith's claim of being a divinely selected prophet tend to also doubt Smith's claims about the Book of Mormon's

origins. The majority of scholars who study pre-Columbian history and archaeology have either ignored the Book of Mormon, or have expressed doubts about its historical value.

Book of Mormon skeptics have noted how little evidence there is that Smith ever had gold plates. Smith wrote that after he translated the plates, he returned them to the same angel who revealed their location on the hill. To many believers, the possibility that an angel made the plates unavailable is consistent with other instances of God testing people's faith. To nonbelievers, however, there seems to be an inconsistency. Having people accept the Book of Mormon was a priority to Smith. He initiated a missionary effort that today includes more than 50,000 LDS missionaries who teach about the Book of Mormon. If the plates were still available for inspection, they might provide convincing evidence of the Book of Mormon's authenticity and help bring many more believers to the LDS Church.

During the period that Smith is said to have had the plates, almost everyone who asked him for permission to see them was forbidden. However, two groups of Smith's trusted followers (one group of eight and another of three men) testified that they saw the plates. The two testimonies of these groups are published in the front of the Book of Mormon. Skeptics have noted that five of the 11 witnesses were from a family named Whitmer, and a sixth was a Whitmer son-in-law. Three more were from Smith's immediate family and a fourth was Smith's third cousin. Skeptics have also noted that there is evidence that the witnesses saw the plates only in spiritual visions.

Other doubts about the Book of Mormon have arisen from the book's content. To some authors, parts of the Book of Mormon appear to have been plagiarized from texts that were available in Smith's time. In addition, anachronisms in the Book of Mormon have been identified, such as mention of animals (e.g., horses, elephants) that did not exist in the Americas during the Book of Mormon era. The Book of Mormon teaches that Native Americans (some older editions imply most Native Americans, but a newer edition implies only some) are descended from people who migrated from Jerusalem. However, current genetic, archaeological, and anthropological evidence does not support this hypothesis. LDS

scholars, some affiliated with Brigham Young University, have published numerous responses to these and other Book of Mormon criticisms.

## "Boy Who Cried Wolf"

Although most people believe that they are able to detect when others are lying, research demonstrates that they are not able to do so. Interest in being able to know when another is lying has resulted in a variety of studies undertaken to examine this phenomenon. The boy-who-cried-wolf effect is a psychological heuristic, or simple learned rule, that helps explain how individuals make the decision that someone is lying. The boy-who-cried-wolf effect demonstrates that most observers are unable to distinguish the trait of trustworthiness from honesty, and is thus consistent with other research in the field. Once individuals believe that another person is lying, they tend to rate that person as generally untrustworthy. It also seems that once a negative evaluation of someone's trustworthiness has been formed, it is very difficult to change that assessment.

Attempts to determine human ability to detect when deception occurs as a part of interpersonal communication have taken place for over

a century. The "Boy Who Cried Wolf" is one of Aesop's fables, a series of stories attributed to Aesop, a slave and storyteller who lived in ancient Greece. Fables have long been viewed as a way to teach truths, especially to children. The "Boy Who Cried Wolf" involves a boy who works as a shepherd, guarding sheep that graze in a pasture near a village. The boy becomes bored watching the sheep, and periodically goes into the town and falsely tells the villagers that a wolf is attacking the sheep. After several such false alarms, the villagers resolve not to be tricked again and no longer put faith in the shepherd's statements. When a real wolf then appears and begins attacking the flock, the shepherd again seeks the villagers' assistance, but to no avail. As a result of the shepherd's prior deceptions, the villagers refuse to believe him and the flock of sheep is destroyed.

For over 2,500 years, the "Boy Who Cried Wolf" has been used as a moral example of the risks of deception, especially for children. The fable has great appeal because it clearly makes the case that lying results in bad things occurring to the tellers of falsehoods. Because the "Boy Who Cried Wolf" is not tied to any one faith, it is accessible to members of various cultures and religions. The fable has had significant influence, so much so that the phrase "to cry wolf" has become synonymous with lying.

### Crying Wolf in Theory

Examinations of why individuals are unable to distinguish between the deceptive and truthful communication and behavior of others have begun to examine the role of cognitive heuristics in determining deception. Fundamental attribution error (FAE) is one such cognitive heuristic. FAE involves the tendency to overestimate the importance of dispositional factors, such as making eye contact or loquaciousness, when deciding whether another is making truthful or untruthful statements while underestimating the significance of the situation in which the observed behavior occurs (such as during a medical examination, as opposed to during an afternoon party). Studies that explore the boy-who-cried-wolf effect examine why humans have difficulty determining when a normally untrustworthy person is telling the truth, or when a normally trustworthy person is engaging in deceptive statements.

The boy-who-cried-wolf effect examines how a general reputation for veracity or dishonesty affects the abilities, biases, genetic capabilities, or motivations of the individual who attempts to distinguish truth from deception. Specifically, these studies have examined the characteristics of the receiver of information, not the person sending truthful or untruthful statements. By examining the difficulty in detecting lies from the perspective of the receiving party, these studies have disclosed a cognitive bias among observers that reflects observers' beliefs regarding the personal characteristics of the sender, rather than actual differences in the credibility or demeanor of those being assessed.

What these studies have found is that when receivers attribute positive traits to someone, such as thinking someone to be attractive, interesting, or likeable, receivers are more likely to believe the other person is also telling the truth. As a result, positive correlations are found between positive dispositional judgments and truth accuracy, but these same attributions will work against the receiver when the sender is actually lying. If a receiver thinks well of the sender, the receiver will be disposed to believe that the sender is truthful. When the sender who is well thought of is actually lying, the receiver's accuracy in detecting deception is negatively affected. The fundamental attribution heuristic is activated when observers are asked to decide whether another is telling the truth or lying. This finding has several implications.

Whenever individuals are asked to decide whether someone is telling the truth or not, a fundamental attribution heuristic is activated. Because most lies are not significant, individuals make an accurate overall judgment of another person that serves as a guide for their interactions with that person, rather than focusing only on the truth of the person's statements. Less than a minute is needed to reach such judgments, and consensus about credibility does not represent accuracy regarding truthfulness. Most important, however, is the realization that even confirmed liars tell the truth upon occasion, and even the most honest individuals lie from time to time. As a result, when determining whether another is lying, people should rely more upon situational-related relevant states, such as an individual's

motivations for lying, than upon the individual's enduring traits, such as a reputation for honesty.

## Bragging and Grandiosity

Bragging is vanity on display. It occurs when a person refers to himself or his actions in excessively positive or grandiose terms. Bragging is much like praising; however, praise is offered to someone over whom the praiser claims no proprietary status. It is therefore an act of discursive giving, for it gives honor. In contrast, bragging, because it is self-referential, intends to take honor. One may brag of oneself, an object, or a bonded other such as an offspring, spouse, workplace, football team, or even a car. So long as a proprietary relationship exists between the speaker and the object, excessive positivity of language may be regarded as bragging.

### Bragging and Status

A brag is not regularly measured by the words spoken. A speaker's claim to have purchased a new car, for example, is merely a claim of fact, but it can be interpreted as a brag, depending

on the occasion, the audience, and the tone of voice, and so forth. Conceived as an attempt to claim or raise status, the dynamics governing bragging fall into place. One can hypothesize, for example, that bragging will be less tolerated among equals in contexts in which social status and mobility are comparatively rigid, such as classrooms and organizations. On the other hand, where status and mobility are flexible, bragging tends to be better tolerated, such as within competitive sports, where one can win “bragging rights” by advancing to a higher competitive level or by winning a game. Similarly, toddlers who brag about height, skill development, and even the quality of a bowel movement find their announcements well-received and congratulated, for the infant is obligated to a long period of status development.

Nevertheless, because social resources are finite, audiences regularly respond with trepidation to the bragger’s attempt to raise status and with envy of the bragger’s claim to new status. Bragging’s effect is best understood by imagining the words “I am better than you because . . .” prior to the boast, for it is a reminder that the one who is most sensitive to the brag is the one who feels a threat in it, a threat not felt by people who are far outside the status of the bragger. Neither a millionaire nor a vagrant, for example, will experience much more than boredom if a plumber brags that he averages \$200 for each house call; but another plumber who averages \$130 for his house calls will feel the bitter sting of lost status in the bragger’s words.

When the brag is discovered as a lie, the resentment is even greater because the brag in that case is patently recognized as an attempt to steal status. The dynamic relationship between bragging and resentment is well delivered in the Barry Levinson film *Envy* (2004), in which a 3M worker becomes unbearably envious and resentful of his friend and coworker’s successful get-rich-quick invention.

In Western culture, for century upon century, the virtue of *humiltas*, a caution against bragging, has been set forth as a quality of the refined in character. Similarly, in the East, *ch’ien*, commonly translated as “modesty,” takes a similar position. In this parallel, a cross-cultural disposition can be detected against bragging that is intimately connected with the preservation of established

hierarchies, a broadly distributed disposition against bragging that is organized around the dissuading aphorism “know your place.” Thus, when a bragger is referred to as “uppity,” the status ambition implicit in the phrase should not be overlooked. The corollary for *humiltas* was another virtue known as *magnanimitas*, which meant an awareness of one’s greatness. For the devout of the medieval tradition, this was a greatness grounded in their relationship with Christ. The “Christ loves me” expression has repeatedly played a role in social revolutions because it provides a logic from within which the oppressed can be in solidarity with a claim of higher status than the oppressor. Among the nobility, the term *magnanimitas* was self-referential, rather than exclusively Christ-directed, and is well-illustrated by Louis XIV’s well known articulation, *l’état, c’est moi* (the state, it is I).

### The Bragger’s Paradox

Because of envy, intimidation, and conflict, status transition is always a delicate and dangerous social process, one that is regularly mediated through passage rituals (weddings, graduations, or promotions) for just this reason. Bragging, as an attempt to change status and circumvent the legitimate process for doing so, can breed enemies and ultimately result in more status harm than good. The brag statement proposes a hierarchical no-man’s land, a wild west of social position. It thus can cause others to wish or bring harm onto the bragger, and thereby initiates dynamics that may escalate to the point that community wellbeing is threatened. As a result, communities that seek homeostasis tend to sanction bragging. To brag regardless of those sanctions is often seen as a weakness in character, to be a person who is arrogant or insecure. Thus, alongside the fear or envy it may breed, recognized bragging may even lead to status diminishment. Such are the considerations at the heart of what can be called the bragger’s paradox. Successful bragging is thus a delicate art, for one can get into the newspaper, even making headlines, but one cannot carry the newspaper across the street to ensure that the neighbors will see it.

Because of the contingencies of the bragger’s paradox, the artful bragger cultivates strategies to bring forth a brag with subtlety: the former friend

who calls after decades to inquire about a trivial reference that he needs for the book he has been asked to write, the associate who asks another person to mention one of his accomplishments at a party, or the man who used to live down the street and now “happens to be in the neighborhood” with his expensive new car. For the most part, such status bids minimize the bragging quality attendant to them.

The bragger’s paradox plays a prominent role in political rhetoric. Even in cultures in which political power is disproportionately in the hands of the wealthy, political ascendancy requires candidates to demonstrate that they are “of the people” in spirit, if not in fact. Politicians must therefore find a way to convince publics that they are better than their opponents, but not better than their electorate. To allow the public to sense its status inferiority during an electoral cycle is tantamount to political suicide. Consequently, prudent politicians cultivate an aura of humility and “hale fellow well met” in everything they do. Given the everpresent media, however, they are not always successful. Wealthy Mitt Romney, for example, was irreparably damaged by a video in which he expressed that the 47 percent of Americans who believe that “the government has a responsibility to care for them” would vote for Obama no matter what.

The bragger’s paradox also proved damaging to John Lennon when he famously bragged, “We’re more popular than Jesus now.” Lennon’s brag positioned the voice of that generation above, rather than among, its audience.

### Theatrical Bragging

Intimidation plays a role in the reception of bragging when comparing the real-world bragger with the nonintimidating, pretend braggers of the entertainment industry. From the time of Sweet Daddy Siki (a.k.a. Mr. Irresistible, the ladies’ pet and the men’s regret), outrageous theatrical bragging has been used by professional wrestlers to boost their public recognition. Hulk Hogan and the deceased Macho Man exemplified both the bragging of the hero and of the villain, and much of what they claimed was so grandiose that it had to be untrue. However, there is nothing original in that, for boasting in lies in order to glorify the self before battle can even be found in the prebattle brag that

Beowulf makes to Hrothgar in the Anglo-Saxon epic *Beowulf*. Among professional wrestlers, the bragging is spectacular, but it does not turn the audience against the character because theatrical bragging makes no claim for real status and intends no elevation of status in the real world; nor can lie-bragging performed in theatrical space be an act of status theft. Theatrical bragging thus provides a pretend context in which audiences can experience some of bragging’s effects without fully experiencing the intimidation and envy that genuine bragging elicits; it functions, that is to say, in the manner characterized by Aristotle for the reception of drama in general.

Bragging has also become something of an art form within the rock and rap music genre. For example, rapper Big Bank Hank of the Sugarhill

Carl Offterdinger's illustration in *The Valiant Little Tailor* depicts the tailor tricking a unicorn into ramming his horn into a tree, thus resourcefully fulfilling another heroic deed to support his grandiose deception to the king that he is a valiant fighter.

Gang identifies himself in the song “Rapper’s Delight” with the following description:

I’m the c-a-s-a-n-the-o-v-a, and the rest is f-l-y  
 . . . ya see I’m six foot one and I’m tons of fun,  
 and I dress to a t, ya see I got more clothes than  
 Muhammad Ali and I dress so viciously, I got  
 bodyguards, I got two big cars, that definitely  
 ain’t the wack, I got a Lincoln Continental and  
 a sunroof Cadillac.

Such bragging does not breed resentment in the audience, however, probably because audience members are attuned to the pre-existing status gap between themselves and the singer. Rappers may also engage in lie-bragging like professional wrestlers; however, reception of the message is governed by the principles governing theatrical bragging. As to any resentment that might exist between rappers, it is well known that the template for rap, in particular freestyle rap and rap battling, guides the creative toward the elevation of self-status and the diminishment of status in others. The M. C. Luscious hit “Boom, I Got Your Boyfriend!” illustrates this process. Audiences may also gain the satisfaction of pronouncing the vanquishing brag without being placed in the far more complex circumstances that its real world variant would generate, a form of cathexis not elaborated by Aristotle but one that is consonant with his argument. There is also evidence that some rappers, including prominent ones, have resented each other, such as, Big Daddy Kane and Tupac Shakur.

### Lie-Bragging

All such theatrical cases imitate the real world’s honorable tradition of bragging about physical power, possibly even lie-bragging, if the issues are confrontational. Deceptive self-magnification in order to intimidate is a cross-species phenomenon with deep roots in adaptation and survival, such as performances in puffer fish, lizards, and birds. They point to the suggestive notion that bragging, even lie-bragging, can be used to forestall aggression, intimidate others, unsettle opponents, gain workplace advantage, enhance social status, or gain sexual conquest. Male braggadocio, for example, can be something of an aphrodisiac in some cultures and contexts; thus, in William

Shakespeare’s *Othello, the Moor of Venice*, Iago makes plausible to Roderigo the attraction that Desdemona felt for Othello by saying that she was originally enchanted by the Moor’s “bragging, and telling her fantastical lies.” A relic of that sort of masculine braggadocio still exists across the wide spectrum of social performances typical of contemporary Western culture, and is illustrated in such popular reading as *Winning through Intimidation* and *Brag! The Art of Tooting Your Own Horn Without Blowing It*.

Nevertheless, to be regarded a bragger is usually damaging, and to be genuinely regarded a lie-bragger is even more harmful because lie-braggers are not merely regarded as status climbers, but further as status thieves. Lie-bragging is also more risky than simple bragging because all braggers can be challenged to provide unimpeachable evidence for the veracity of the claim and this is something a lie-bragger cannot do. In politics, accusing the opposition of lie-bragging is a staple of campaign rhetoric. During his bid for the presidency, for example, Al Gore was said to brag of a closer relationship to tobacco farming than he actually had. It has also been claimed that Gore bragged of creating the Internet; this charge does not hold up to evidence, but it illustrates the long-term resonance of charges that one is a liar and a bragger.

Where status-motivated lie-bragging occurs in a literary work, it regularly plays a role in a downfall. This happens in the short story “I’m a Fool” (1922) by Sherwood Anderson. The main character brag-lies to gain a girl’s attention, only to be ultimately trapped by his original deception. Similarly, Chichikov, the main character in Nikolai Gogol’s novel *Dead Souls* (1842), is characterized as a charlatan who brag-lies and puts on displays of great wealth (which he does not possess), intending to set in motion the most undignified of schemes that instead results in downfall. Fortunato, in Edgar Allan Poe’s short story “The Cask of Amontillado” (1846), is also a lie-bragger because his love for alcohol seems to exceed his arrogantly professed knowledge of wine.

Other lie-braggers who are more pathetic than ambitious, such as Mr. Pumblechook in Charles Dickens’s *Great Expectations* (1860), are ridiculous, rather than condemned, at the end of the

tale. George Costanza of the television comedy *Seinfeld*, who lie-brags that he is an architect (and another time a marine biologist) and deceives by wearing a toupee, is also brought to heel through ridicule.

If a bragging liar is to appeal to a reading audience, some other quality must diminish the impact of the false vanity. The Brothers Grimm, for example, record the story of “The Valiant Little Tailor,” who starts out bragging that he killed seven flies with one blow, yet inevitably is backed into the lie that the blow killed seven men in order to forestall the aggressions of a giant. The tailor’s position, however, can be likened to the position of the threatened puffer fish and lizard—he lies in the face of intimidating power. Ultimately, the tailor fares well in the story, which focuses less on vanity and misrepresentation and more on the value of a creative and resourceful mind when solving problems; the tailor therefore experiences a remarkable change in status when he marries the princess.

Another character who bragged in lies was Sarah Moffat of the 1970s British television series *Upstairs/Downstairs*. Sarah first appears with the tale that she was raised in France and of noble birth, only to be revealed both plebian and illiterate. In her case, the viewer understands that the poverty of her actual circumstances inclined her toward lie-bragging as a compensation for her ongoing sense of inferiority.

The complex character Randle McMurphy in Ken Kesey’s *One Flew Over the Cuckoo’s Nest* (1962) is also a bragger of lies; however, McMurphy is redeemed in that he performs truths of existence and character (e.g., living through his imagination, standing up for other people who are weak, and fighting injustice) that surpass both his and every other character’s capacity for language. His cocky and dissimulating surface is easily penetrated by the competent reader, who forgives McMurphy’s smaller vanities in the face of an antihero integrity that surpasses all characters in the text. Thus, bragging liars can become objects of affection if their predisposition is situated within an overall complex that renders the brag-lying warrantable, justifiably advantageous, or forgivable. In stable, highly ritualized environments, the brag-liar is anathema; however, in unstable and highly competitive or

conflict environments, the brag-liar may be an appealing figure.

## Brain

A great deal of research has been directed toward a better appreciation of how the brain operates when people engage in deception. Such research may be applied to the development of lie detection technology, but a thriving field of academic inquiry, the cognitive neuroscience of deception, has been making important progress in illuminating the processes by which deception is enacted at a neural level. This complex question has been addressed by a number of scientific disciplines, and convergent lines of research have included (but are by no means limited to) analysis of deceptive behavior in animals, developmental trajectories of deceptive behavior in children, loss of function and pathological studies of human adults, and more recently, psychophysiological and neuroimaging techniques.

Deception is a common feature of communication within human groups, but it is also a common feature of social interaction in nonhuman species. Reviews of deceptive behavior in animals illustrate a number of levels at which deception may be observed and that animals mislead, bluff, and deceive with a range of objectives and levels of sophistication or complexity.

By examining the brains of different species and the ways in which they live and breed together, a startling relationship is found between the average size of a social group and the size of the brain. Specifically, the bigger the social group, the bigger the brain. The "Machiavellian intelligence" or "social brain" hypothesis puts forward the idea that the comparatively large brains and complex cognitive abilities of humans have evolved as a result of intense social competition. It is suggested that earlier on in the human evolutionary lineage,

some individuals may have developed increasingly sophisticated Machiavellian or manipulative and deceitful interaction strategies in order to obtain heightened social position and reproductive success, resulting in a developmental arms race.

### Prefrontal Cortex and Deception

In an extensive survey of trained animal observers in which a number of possible confounding factors were considered, it was discovered that, as both cortical volume and specifically the relative size of the prefrontal cortex in comparison to the rest of the brain increases, the frequency and complexity of reported episodes of tactical deception increases. The prefrontal cortex, which is directly behind the forehead, is strongly linked in humans with language, memory, planning, the control of automatic behavior, and the representation of the minds of other individuals. These processes are all strongly implicated in deception, a finding that more recent neuroimaging studies appear to support.

The role of the prefrontal cortex, and especially areas of the prefrontal cortex supporting the representation of the minds of others (known as theory of mind), is also supported by developmental research. Children are unable to understand or make use of deception prior to a certain point in their cognitive development, usually indicated as around the same time as the development of the fully fledged theory of mind. This includes the understanding that others can have false beliefs, or beliefs that are inconsistent with one's beliefs and may be crucially inconsistent with the true state of the world. Several strands of neurobiological research have shown this period of development to promote rapid development of the prefrontal cortices in children, which have been shown to be crucial for theory of mind, false-belief understanding, and deception.

A causally strong relationship between the brain and specific tasks can be shown by so-called loss-of-function studies, in which performance in a certain domain is altered in some way in brain-damaged participants, thereby establishing brain areas that are essential to the task in question. Such research has been conducted on deceptive behavior. Individuals with Parkinson's disease often demonstrate impairment of executive function, a collection of supervisory functions such as

attentional control, mental flexibility, and task switching. Parkinson's disease sufferers are often noted as being more "honest," showing fewer instances of deception in their everyday interactions. They report difficulty lying when asked to do so in experimental tasks, and this has been shown to coincide with reduced metabolic activity in the left dorsolateral and right anterior subregions of the prefrontal cortex. These parts of the brain appear strongly associated with deceptive tasks in functional magnetic resonance imaging (fMRI) experiments.

Transcranial direct current stimulation (TDCS) is a noninvasive technique by which the normal operation of brain regions can be affected by the use of mild electric currents directed over the skull. These currents, depending on polarity, can be used to either excite or inhibit local cortical functioning. This methodology has been applied to deception in two recent studies. The first showed that excitatory, or anodal, TDCS to the dorsolateral prefrontal cortex slowed the speed and reduced the efficiency of deceptive responses in an experimental task by upsetting the normal operation of the prefrontal cortices.

The second study, on the other hand, found that changes in the excitability of the anterior prefrontal cortex using inhibitory, or cathodal stimulation, actually improved deception in a number of important aspects. Response times were faster, but guilt and galvanic skin response (one of the measures used by the polygraph) were reduced. Interpretation of these second study results suggests that by suppressing activity in the anterior prefrontal cortex using cathodal TDCS, it is possible to reduce the moral conflict that people naturally feel when they engage in deception, thus making deception easier. Although there have been few studies of this type, these results again suggest that a significant role is played by the prefrontal cortex in deception. TDCS studies may prove to be useful in establishing the contribution of a number of cortical structures to deceptive ability.

Although lying is often considered to be a normal aspect of human social life, it is when lying becomes destructive or dangerous that it may be termed pathological and is consistent with the characteristics of a number of clinical conditions such as antisocial, histrionic, narcissistic, and

borderline personality disorders. By understanding brain abnormalities that may be associated with pathological deception, it may be possible to collect more evidence as to the brain structures involved in the process. A recent study examined pathological liars who had shown a pattern of high-stakes deceptive behavior, such as criminal fraud. Their results illustrated an increased level of white matter (the name given to myelin-coated axons of neurons that allow information to be transmitted by the neuron extremely quickly) in a range of prefrontal regions of the brain, specifically the orbitofrontal, inferior frontal, and middle frontal cortices, again illustrating the importance of prefrontal regions in the process of deception.

The various strands of research outlined above give a clear indication that areas at the front of the brain, referred to as the prefrontal cortex, are very strongly associated with the evolution, development, and successful deployment of deception. The advent of neuroimaging techniques, among which functional magnetic resonance imaging (fMRI) is perhaps the most well known, has given researchers the opportunity to more directly look at the processes at work in the brain as people go about the business of lying.

### **Functional Magnetic Resonance Imaging Analysis of Lying**

With over a decade of research employing fMRI and dozens of individual experiments employing a range of types of deception, evidence continues to contribute to the idea that the prefrontal cortices are very important in the process of deception. General findings borne out by behavioral research have shown that individuals report deception to be cognitively demanding. Observations of "response latency," or the time delay between asking a question and receiving a response, suggest that it usually takes longer to lie than to tell the truth. In both of these situations, whether talking about how difficult the task of deception may be or comparing times taken to give deceptive responses, the control condition (or baseline) is truth-telling.

The method for comparing patterns of brain activity used in fMRI studies of deception is exactly the same. Based on the assumption that truth-telling is the default or baseline in human

*Psychologist Daniel Jay Goleman, science journalist and author of *The Psychology of Self-Deception*, leads a talk at the National Institutes of Health Deputy Director for Management Seminar Series, February 14, 2013. He discussed how the amygdala, the brain's emotional center, interacts with the brain's executive center, or prefrontal cortex. Studies have shown that exciting or inhibiting areas of the prefrontal cortex, which is strongly related to an individual's ability to deceive, increases and decreases deceptive ability, respectively.*

communications, researchers employ statistics in order to identify regions of the brain that are significantly more active during the process of lying than when telling the truth. Analyses such as these have identified a broad range of brain areas that are more active when persons are lying than when they are telling the truth.

However, a number of researchers have found no areas of the brain that are more active when telling the truth than when lying, supporting the idea that deception is a taxing process for the brain to perform. Many of the regions noted for their activation during deception may be termed frontal executive systems, and regions identified as preferentially active in deceptive conditions include many distinct parts of the front of the brain, such as the dorsolateral prefrontal cortex, the ventrolateral prefrontal cortex, the anterior prefrontal cortex and the anterior cingulate cortex.

This complex interplay of cortical activations is consistent with deception viewed as a task that requires extensive “executive control.” Executive

control may be conceptualized as a broad range of higher cognitive processes permitting the flexible modification of thought and behavior to cater to changing situational and environmental conditions. For example, the dorsolateral prefrontal cortex has previously been shown to be active during tasks in which response selection is required, perhaps similar to when making a decision to lie or to tell the truth. This area is also associated with aspects of working memory. The ventrolateral prefrontal cortex is associated with task demands such as response inhibition, such as the inhibition of a prepotent truthful response. The anterior prefrontal cortex is often associated with a process of integration of subprocesses designed to meet some broader strategic outcome, whereas the anterior cingulate cortex is often associated with conflict detection, such as that which might emerge from deceptive responding when individuals are fully aware that this is not a true reflection of information that they have or memories they possess.

In considering results such as these, scholars unfamiliar with fMRI analysis should beware of the “reverse inference” fallacy, whereby researchers often wrongly claim that seeing a region of the brain active during a task means the categorical involvement of a particular cognitive process. The same area of the brain can be involved in a number of very different cognitive processes, and this complexity means that specifying that a certain brain region does a single specific task is not possible.

### Types of Lies and Brain Activity

As can be seen from any overview of deception research, behavioral or neuroimaging in nature, a broad variety of experimental paradigms are employed. Specific analysis of different types of lies has found that the anterior prefrontal cortex is employed for general deception, but in the case of lies that were rehearsed (rather than spontaneous), activity in this part of the brain increased. The anterior cingulate cortex, on the other hand, is sensitive to differences in the type of lie produced, with results indicating that it is more active in spontaneous lies, which do not sit within a coherent narrative, than in rehearsed lies. With just these two examples, it is clear to see that the type of lie produced, of which there may be hundreds ranging from lies of omission to white lies and sarcasm, has a strong influence on what parts of the brain may be active and which cognitive processes may be at work.

The current ability to record the activity in an individual’s brain and accurately determine whether he or she is deceptive is by no means perfect, although companies already exist to do just that, and published research testing possible analysis techniques often achieve accuracy results that exceed polygraphy. Individual brains vary a great deal in size, structure, and how they perform processes, and so-called individual differences make it very difficult to compare one person with another in the same study, let alone generalize to the population as a whole, which might be required for a robust and universal brain “signature” that accurately relates to deception.

Although the majority of research examining the brain has focused on instances in which an individual tells a lie, a few studies have also tried to understand the processes involved in lie detection.

One notable study asked people to watch clips of people performing nonverbal behavior to identify when they were deceptive. When people judged that a specific clip showed the intent to deceive, the amygdala and rostral anterior cingulate cortex were activated, and later results also indicated that the amygdala only responded when they realized that they had been lied to. This region of the brain is often active during tasks with emotional content, suggesting that an important part of the lie detection process, and the result of being lied to, may be emotional in nature.

## Brer Rabbit

Brer Rabbit is the most well known of the anthropomorphic animals populating the stories told by the fictitious Uncle Remus, a synthetic character invented by Georgia journalist Joel Chandler Harris (1848–1908), based upon several African American storytellers he knew. Harris wrote his

first Uncle Remus stories in 1876 as a regular column for the *Atlanta Constitution*. These were soon syndicated and distributed throughout the United States. They proved to be so popular both north and south of the Mason-Dixon Line that demand for a book-length anthology resulted in the publication in 1880 of *Uncle Remus: His Songs and His Sayings*, which was followed by seven additional volumes. In these best-selling story anthologies, as well as his popular newspaper columns, Harris presented oral folklore that he had collected from former slaves in Georgia that he then retold in his written version of the African American dialect prevalent in 19th-century Georgia, which linguists regard as a fairly accurate transcription of that spoken language's syntax and vocabulary.

The stories are richly textured tales that draw upon the oral folk traditions of both African and Native American sources. They include additional material reflecting the lived experience, attitudes, and values of former slaves living in the south during and after Reconstruction, for whom such stories provided a narrative means of expressing outrage, critiquing injustice, vilifying tormentors, and vicariously enjoying revenge exacted by the oppressed upon their oppressors. Folklorists have found that Harris stayed true to his source material, and they have established relationships between many of the stories he recounts and their antecedents on both sides of the Atlantic. Others are unique to the Uncle Remus corpus, and might represent local oral traditions that would have been lost had they not been recorded by Harris.

The animal stories featuring Brer Rabbit and his friends and foes are told within a broader narrative framework, written in standard American English, in which a benevolent Uncle Remus shares his time and stories with a young white boy who he befriends. Harris's depiction of this relationship, and of the plantation life in which it takes place, has been criticized for promoting a romanticized version of race relations in the post-Civil War south, in which African Americans are, like Uncle Remus, content, passive, and pacific. Others, such as film director Spike Lee, suggest that through his tales, Uncle Remus cleverly subverts, rather than upholds, white authority.

### Clever Trickster

Brer Rabbit (Brer, or Br'er as it is sometimes spelled, is a syncope for Brother) is a clever trickster who manages to survive—even thrive at times—by employing his quick wit, sharp psychological insights regarding his adversaries, and an in-depth knowledge of the hostile cultural and geographic terrains that he must navigate. Brer Rabbit is especially adept at deceiving adversaries and even his friends and allies, when he deems it appropriate to do so. His skill in deception is central to many of the stories in which he features.

Of all the Brer Rabbit tales, none is perhaps as famous or popular as the story of his encounter with the Tar Baby, a doll crafted of tar and turpentine and placed beside a major thoroughfare by his perpetual nemesis, Brer Fox, who created it as a means of capturing Brer Rabbit. As Brer Rabbit passes by, he greets the doll, which as an inanimate object naturally remains silent. After several frustrated attempts to get the Tar Baby to respond, Brer Rabbit takes offense at its stubborn silence. He hits it with one paw, which sticks to the tar. As he continues to attack the Tar Baby, Brer Rabbit becomes inextricably stuck to it, at which point Brer Fox appears and announces that he will barbecue the rabbit, who—using reverse psychology—thanks the fox for planning to do that instead of throwing him in the briar patch. Brer Rabbit then declares that he would rather have Brer Fox hang, drown, skin, or maim him than be thrown into the briars. Wanting to hurt Brer Rabbit as much as possible, Brer Fox opts to throw him into the briar patch, which enables Brer Rabbit to disengage from the Tar Baby and escape.

Brer Rabbit is also capable of being fooled. In a story reminiscent of Aesop's famous fable, the race between the tortoise and the hare, Brer Terrapin bets Brer Rabbit that he can beat him in a race. However, instead of fairly competing, Brer Terrapin plants members of his family along the race course at the posted intervals, so that he wins the bet by appearing to have run the full course faster than his opponent.

The tales of Brer Rabbit have played an important role in American culture. For example, to this day, "tar baby" is used to denote an aggravating entanglement. (Some—perhaps unfamiliar with the term's African American roots—consider it to be a racial slur.) His stories also inspired the

1946 Walt Disney musical film *Song of the South*, which blended the studio's signature animation with live-action footage. A hit song from that film, "Zip-a-Dee-Doo-Dah," won the Academy Award for Best Original Song in 1947. It was sung by James Baskett, whose portrayal of Uncle Remus earned him recognition in the form of an honorary special Academy Award, making Baskett the first African American male to win an Oscar. The film features an animated version of the famous encounter between Brer Rabbit and the Tar Baby that takes some narrative license with the original.

*Song of the South*, like the tales upon which it is based, has generated controversy, with critics condemning its sanitized version of southern plantation life and its depictions of African Americans as visually and verbally exaggerated caricatures that perpetuate negative stereotypes. Brer Rabbit has appeared in other films, as well as cartoons, comic books, songs, video games, and even an amusement ride, Splash Mountain, which is featured at several Disney parks around the world.

## Burgoon, Judee

Judee K. Burgoon is an American scholar best known for her work in interpersonal and nonverbal communication, and on the detection of human deception using verbal and nonverbal cues. On the faculty at the University of Arizona since 1984, Professor Burgoon currently serves as the director

of research for the Center for the Management of Information, and she is the site director for the National Science Foundation-sponsored Center for Identification Technology Research.

Burgoon earned her doctorate in communication and educational psychology from West Virginia University in 1974, and she has since authored or edited 13 books and monographs and nearly 300 published articles, chapters, and reviews related to nonverbal and verbal communication, deception, and computer-mediated communication. Her research has been funded by U.S. government agencies such as the National Science Foundation (NSF) and the Department of Defense, as well as private companies and non-profit foundations. She is one of the most-published and most-cited researchers in the discipline of communication and has been named by numerous publications as the most prolific scholar in communication in the 20th century.

The most notable of Burgoon's countless honors and awards are the B. Aubrey Fisher Mentorship Award and the Steven B. Chaffee Career Achievement Award from the International Communication Association, and the Distinguished Scholar Award and Charles H. Woolbert Research Award for Scholarship of Lasting Impact from the National Communication Association. She has also been elected a fellow of the International Communication Association, as well as a member of the Society for Experimental Social Psychology.

### Expectancy Violations Theory and Interpersonal Deception Theory

Burgoon's research in the late 1970s and early 1980s was on the reactions invoked by violations of personal space. She developed the expectancy violations theory (EVT), which posits that discrepancies from expected nonverbal behaviors generate arousal, causing either positive or negative reactions, depending upon the attractiveness (positive valence) or averseness (negative valence) of both the violation and the communicator. A robust research program conducted by Burgoon and others using EVT has demonstrated how violations of expectations can help draw attention away from the content of a message and toward the unexpected behavior itself, engendering more positive interpretations of both the behavior and the message for positively valenced

communicators, but more negative evaluations for negatively valenced communicators. Burgoon's research has examined the effects of a broad range of verbal and nonverbal expectancy violations on the credibility and attractiveness of communicators, and on the quality of relationships when such violations are enacted.

In the 1990s, Burgoon began a long collaboration with David Buller and others in which she applied her knowledge of verbal and nonverbal communication to the detection of interpersonal deception, leading to the development of interpersonal deception theory (IDT). IDT posits that deceivers use strategic and nonstrategic behaviors to deceptively communicate, while recipients attempt to assess deceiver credibility. Strategic behaviors are seen as purposeful attempts to manipulate interactions, whereas nonstrategic behaviors are thought of as "leakage" that may provide clues to the presence of deception.

IDT is one of the only theories to examine how the behaviors of the deceiver and the receiver interact to perpetuate deception. While the deceiver is manipulating his or her message to appear truthful, the receiver is assessing the credibility of the speaker (perhaps unconsciously) while hiding any suspicion and providing feedback to the deceiver. The deceiver, in turn, can use the feedback from the sender to alter his or her behavior and appear more persuasive. The unit of analysis for IDT thus becomes the interaction, rather than the acts of the deceiver, the content of the message, or the responses of the receiver in isolation. Ultimately, the theory offers a communication-based explanation for how the give-and-take of human interaction can be observed to affect both the detectability of deceivers and the accuracy of credibility assessments.

### **Interaction Adaptation Theory**

Burgoon's work with both EVT and IDT has spawned a third theory: interaction adaptation theory (IAT), which posits that certain preinteraction conditions, such as a speaker's biological requirements, social expectations, and psychological desires, set the stage for the interpretation of behaviors exhibited during an interaction. A comparison between the preinteraction requirements, expectations, and desires and the actual behaviors unfolding within an interaction leads

to potentially favorable reactions in the form of reciprocity, or unfavorable reactions in the form of compensation. According to IAT, when needs, expectations, and desires for truthful interactions with a partner are perceived as deceptive, receivers will compensate by withdrawing and decreasing intimacy. Conversely, when these three receiver-oriented components are met with behaviors perceived as veridical, receivers will reciprocate by enacting approach behaviors and increasing intimacy.

Thus, IAT has formalized a basic assumption underlying all three of Burgoon's theories, namely that interactants are influenced by both preinteractional conditions and by how conversations unfold. The actual behaviors of interaction partners can often override the preinteraction expectations, but both can have implications for the outcomes of interactions and the development, maintenance, or dissolution of relationships.

Burgoon's work in the early 21st century has focused on the interactive nature of human communication through mediated channels. She has developed a model of interactivity, proposing how the structural properties, or "affordances," of a medium—such as the synchronicity of the communication, the richness it allows, and the geographical proximity of the interactants—can influence the experience of participants and the outcomes of their interactions, such as task performance and social judgments.

Applying the principle of interactivity to deception detection, Burgoon has demonstrated that the richest mediums are not necessarily the most effective for deception detection. The volume of information in the form of verbal and nonverbal cues can overwhelm receivers and make it more difficult for them to detect deception. On the other hand, isolating the most diagnostic deception indices, such as those within the vocalic channel, can oftentimes be more efficient at detecting deception. In 2012, Burgoon was working with a team of investigators at the University of Arizona to examine the most effective technologies for automating the detection process to remove human biases from the equation, and advance the science of deception detection into the future.

## Bush, George W.

George W. Bush was president of the United States from January 20, 2001, to January 20, 2009. After narrowly winning the 2000 presidential election against Vice President Al Gore, the Bush administration faced the terrorist attacks of September 11, 2001, which led to wars in Afghanistan and Iraq. President Bush and his administration have been publicly scrutinized and criticized for providing false information to the American people in the run-up to the Iraq War.

The Bush administration first made claims against Iraq and the country's connection to weapons of mass destruction (WMDs) in February 2002. Joseph C. Wilson, the former ambassador to Gabon and São Tomé and Príncipe, was commissioned by the administration to investigate Iraq's alleged desire to obtain yellowcake uranium from Niger in 2002. Wilson reported to Bush and his colleagues that the belief that Iraq was engaging in illicit construction of a nuclear weapon was "unequivocally wrong." However, the administration persisted in searching for a connection between Iraq and WMDs. In his 2003 State of the Union Address, President Bush professed that Iraq

President George W. Bush signs the U.S. Department of Defense Authorization Bill at the Pentagon on December 2, 2002, noting that Iraq's responses up to that date were "not encouraging." Signing the act helped chart the course of the War on Terror.

sought to obtain uranium, despite a Central Intelligence Agency (CIA) investigation confirming the opposite to be true.

In September 2002, the Bush administration, the CIA, and the Defense Intelligence Agency suspected that Iraq was looking for ways to acquire high-strength aluminum tubes in order to “make centrifuges to enrich uranium for nuclear bombs.” The Bureau of Intelligence Research and Department of Energy refuted the assertion that high-strength aluminum tubes were being used to build nuclear weapons. Rather, the two agencies maintained that the tubes were being used for conventional military procedures, and that the tubes were not able to enrich uranium. Despite this information from various government departments, Secretary of State Colin Powell presented information to the United Nations (UN) implicating Iraq as a country destined to use high-strength aluminum tubes for the eventual creation of a nuclear bomb. Upon further review, Powell rescinded his statements to the UN, and noted that he was given “deliberately misleading” information on Iraq’s quest for nuclear weapons.

### **Downing Street Memo**

On May 1, 2005, the national Sunday newspaper of the United Kingdom, the *Sunday Times*, published the Downing Street Memo. The memo was documentation of a secret meeting held by the British Labour Party and British defense and intelligence figures on July 23, 2002. Meeting participants discussed the ramp-up to a war in Iraq, and referenced the United States as also having a stake in the war effort. The leader of the Secret Intelligence Service in Britain noted that during his most recent visit to the United States, “Bush wanted to remove Saddam Hussein,” the president and prime minister of Iraq, “through military action, justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy.” Despite numerous allegations from the Bush administration stating that Iraq was preparing to construct a nuclear weapon, substantial evidence never surfaced from either U.S. or UN investigations.

Presidential Press Secretary Scott McClellan, who served in the Bush White House from 2003

through 2006, later faulted his boss for succumbing to “self-deception” and “permanent campaigning” throughout the planning of the Iraq War. In his 2008 memoir, McClellan insinuated that Bush’s domestic and international strategies focused on intense nationalism, blind accusations about foreign policy, and personal concern about public approval, rather than making sound choices for the nation. While McClellan’s book never stated that Bush explicitly lied to the American public, he asserted that the Iraq War was a result of political propaganda employed by the Bush administration. Many administration officials denounced McClellan’s memoir, believing that his unhappy experience while serving in the White House made him speak falsely about the inner workings of the presidency.

The Iraq War has been analyzed by a variety of political organizations and interest groups. In 2008, The Center for Public Integrity (CPI), a non-partisan, nonprofit investigative news organization, created a project called Iraq: The War Card. During this investigation, researchers documented every public statement made by the Bush administration’s top eight officials from September 11, 2001, to September 11, 2003. The CPI found that the administration made 532 statements about Iraq, claiming that the country had, produced, or tried to obtain WMDs, and had links to Al Qaeda, an Islamic terrorist organization. As the 911 Commission report has made clear, these statements are false because Iraq did not have WMDs, nor did it have links to Al Qaeda. An important question related to deception is whether Bush and his administration made these statements knowing them to be false, or whether they believed the statements and were simply mistaken. While it is difficult to confirm that President Bush and his advisors deliberately lied to the American people about the rationale for the Iraq War, the statements made in the run-up to the war were false.

Immediately after his two terms in office, President G. W. Bush did not make many public engagements. However, he was part of relief efforts to raise funds for a massive earthquake that hit Haiti in January 2010. These efforts, in collaboration with President Bill Clinton, raised over \$5 billion. His philanthropic and diplomatic efforts, including those in Africa, have provided better health care for struggling populations and

have contributed to a rise in Bush's favorability. A June 2013 Gallup poll found that opinions about President G. W. Bush were more positive than negative for the first time since 2005.

George W. Bush's presidency will likely be remembered as one of the most trying times in recent American history. In 2013, Bush was quoted as being "out of politics" for good, giving no opinion about matters of diplomacy or domestic affairs. His silence has been met with mixed reviews, and his legacy will likely follow suit.

## Business

Business, a profit-seeking enterprise, is often seen as synonymous with deception. Numerous illustrations of corporate scandals, buried under lies and deception, exist in industries throughout the world. Individuals entering the business world find that opportunities and temptation to lie and deceive are abundant. Often, the drive to be profitable is seen to conflict with the motive to behave ethically and truthfully. Based on high-profile scandals and news reports, deceptive individuals and groups seem to permeate the business world, driven by competition and a desire to

succeed. From teaching business ethics to some of the largest corporate scandals, ethical debates arise from business decisions and exposed deception, often leading to individual- and organizational-level humiliation, financial loss, and legal punishment.

Deception in the business world may be seen as a method to succeed, but it can also come with many costs. Unethical behavior can damage individuals by conflicting with their personal values. Deceptive practices interfere with the flow of information in an organization, impeding organizational success. Deception can result in serious theft and lawbreaking, leading to lawsuits and, in extreme cases, is costly and deadly to society at large. Estimations of the costs of dishonesty in business in the United States range from \$6 to \$200 billion annually.

Deception in business can occur at different levels. Deception on a micro-, person-to-person level, such as office politics, can damage morale, lower employee satisfaction, and create a climate of distrust. Such a climate impedes the amount of information that employees are willing to share with one another, ultimately damaging the output of the work. On a meso-, company, and company-to-company level, cultural climates that encourage dishonesty and deception can occur, and intracompany dishonest negotiations can severely impact the success of one or both companies. There is also an employee versus company dynamic in which unethical climates drive turnover and affect the bottom line by reducing the quality of the work. On a macro-, or organization-to-society level, corporate decisions have a vast impact on national and world economies, public health and safety, and the environment.

### Theories of Ethics

No set definition exists for what is or is not ethical in business. Each example must be looked at individually and, even then, debate can occur on the morality of many business decisions. Cultural relativism, the concept that morals and ethical standards differ among civilizations and cultures, is also important when considering deception in business, especially in today's global economy. For instance, Japanese negotiators have a tendency to reveal less information than U.S. negotiators. U.S. negotiators focus on direct information; Japanese

negotiators focus on indirect information. Cultural differences in negotiation style can easily be misinterpreted as a form of deliberate deception. Additionally, U.S. corporations must use deceitful financial tactics to conceal bribery.

In Germany, however, such deception is not always necessary, because bribery is seen as a business necessity and can even be tax deductible. However, bribery is generally frowned upon in global business in the interest of fairness. Compass, a foodservice company headquartered in England, was found guilty of bribing United Nations (UN) officials to ensure that it would obtain a \$235 million contract to provide food supplies to UN forces in Liberia. Compass settled with two competing companies, ES-KO International based in Monaco and Supreme Foodservice based in the United States, after they sued regarding the manner in which the UN contract was won. Compass also announced that all employees found to be involved in the bribery were terminated.

Defining deception in business decisions generally falls into one of the normative ethical theories, regardless of how individuals might view the theory based on their personal values. Normative ethical theories focus on how individuals should act. Some of the theories commonly taught in business schools include: virtue ethics, deontology, and teleological ethics (or consequentialism). A key element in all these theories is a focus on the malleable nature of ethics and a situational or conditional quality to all ethical decision making, often framed in issues of “the greater good.” Because the greater good in business is often framed in profit and success, an examination of the ethical theories taught in business schools provides the framework to examine deception in business.

Plato, one of the fathers of virtue ethics, states that the rulers of society are the only people who should have the privilege of lying at home or abroad. Rulers can lie for the good of the state in accordance with the Noble Lie, or the lie told by the elite in order to maintain order. Aristotle’s virtue ethics, expanding the philosophies of Plato, emphasize the moral character of a person. A virtue is a means between two extremes and the cardinal virtues are: fortitude, prudence, temperance, and justice. Temperance would be the mean

between rash action and complete inaction. In this line of thought, a decision to be honest might fall between a tactless or hurtful statement, and harmful deceit.

Deontology comes from the Greek *deontos*, meaning “ought.” Humans should act out of reason, not inclination or emotion; duty is the action that reason determines to be correct. According to Immanuel Kant, the morality of an action stems from the intention (motive) of the action. Duty is determined by the categorical imperative, or acting in a way that is universally acceptable and correct: If I act in a certain way, then it should be right for everyone to act that way; if not, the act is immoral. Kant does not claim that deception is always wrong. For instance, Kant once gave the example of lying to stop the plans of a potential murderer; in this instance, the duty to protect a life overruled the duty to not deceive. The theories of W. D. Ross suggest that no single formula for ethics is universal and immortal. Ross emphasizes the *prima facie* duties of: fidelity, reparation, gratitude, justice, beneficence, self-improvement, and nonmaleficence. An absolute duty is a duty that, in a given situation, is the most important, determined by intuition.

Teleological ethics focuses on the outcome of an action. The most commonly taught consequentialist theory is John Stewart Mill’s utilitarianism, in which actions should produce the greatest amount of happiness (presence of pleasure, plus the absence of pain) for the greatest number of people. In this sense, the needs of the many outweigh the needs of the few, or the one. A utilitarian might justify lying if it would prevent more harm than the lie itself would cause. None of the normative ethical theories blatantly claim that deception is always unethical. The thought process behind each theory can be used to justify lying in a variety of situations.

Today, most business school students in the United States are required to take a business ethics course. A common misconception is that professors are trying to teach students, at this point adults with their own developed moral compasses, how to ethically behave. Unlike teaching personal morals and values, which individuals acquire throughout their life, teaching business ethics is more focused on outlining professional responsibility and understanding the concept of

morality in oneself and others in order to allow students to critically evaluate situations. Business ethics courses generally cover the different ethical theories. The goal is not to say that “this philosophy is the most morally and logically sound,” or “everyone must adhere to this school of thought.” The theories are taught so that students might be better able to recognize how people arrive at a conclusion regarding the ethics of business-related decisions.

### **Individual-Level Deception in Organizations**

Individual-level lying in business often begins before the first day of work. Deception can often be found in the hiring process and continues in the day-to-day individual interactions in organizations. During the hiring process, the organization and the candidate have an obligation not to lie. It is the organization’s responsibility to properly advertise the position and provide a job description that accurately represents the job and lists the skills necessary for the position. A realistic job preview by the organization allows candidates to determine if the job is a good fit for them. Honesty on the part of the candidate allows the organization to decide if the candidate is in turn a good fit for the position. Dishonesty on the part of either party is ultimately costly if it leads to poor performance or turnover.

Individual deception in the workforce is commonly linked to impression management or the alteration of one’s presentation in order to be perceived a certain way. Job applicants will often try to appear more knowledgeable in order to gain approval from hiring managers. Once hired, employees may also appear happy and complacent with a new policy, even when they are displeased. Disadvantages of individual deception in business include: decreased job satisfaction, increased anxiety and stress, increased turnover, and reduced performance. Business deceptions on this relatively small scale (compared to multimillion-dollar corporate scandals), such as exaggerating work efforts, taking unearned credit for others’ work, deflecting blame for a poor job performance, buying personal items on the company credit card, and taking home office supplies, taken together, have a severe negative impact on the organization and reoccurring instances can be grounds for termination.

Much of the literature suggests that the competitive environment that drives business is also one of the motivational forces that also drives lying and deception (that is not to say that literature does not also point out the benefits of a collaborative environment). Additionally, competition can lead people to deceitful behavior in the workplace, and often this behavior results in positive and rewarded outcomes, such as winning in negotiations, looking better to the boss, and getting credit for the work. Organizational politics, the protection of self-interests over organizational goals, has been found to result in productivity loss and can result in toxic cultures within organizations. Susan Curtis provides instances in which lying may play a part in organizational politics, including controlling access to information, cultivating a favorable impression, developing a base of support, blaming and attacking others, and aligning oneself with more powerful others. Such a culture of deception has led to some financially devastating corporate scandals. The nature of an organization and the policies in place might also blatantly foster employee deception. For instance, consider call centers based in India that tell their employees to use Western names. In such cases, the organization is actively supporting a deceptive environment.

While deception in the workforce might serve the deceiver well, theories of organizational justice address the impact, inequalities, and unfair results of deception and deceptive practices. Organizational justice theories posit three main components of justice: distributive, procedural, and interactional. Distributive justice focuses on fair distribution of resources. Procedural justice relates to the use of formal processes to make decisions, and the fairness of these processes, leading to outcomes. As it relates to an organization, outcomes include pay, praise, and promotion. Interactional justice relates to how individuals treat and communicate with each other. According to a meta-analysis performed by Yochi Cohen-Charash and Paul Spector, distributive and procedural justice are largely related to organizational citizenship behaviors, or the positive work-related behaviors that go beyond the duties required for the job. Job performance is positively related and counterproductive work behaviors are negatively related to procedural justice. Job satisfaction is related to all

of the organizational justice components. Trust is also related to all of the components, but is most closely related to procedural justice. Research has found that perceptions of justice are related to organizational success and perceptions of justice are negatively related to deception.

### Research of Deception in Business

Studies have found that 86 percent of employees engaged in deceptive impression management through not providing honest opinions and feedback; 69 percent attempted to cover up poor performance through deceptive impression management; and 56 percent simply lied about facts. Of these behaviors, hiding opinions had no effect on the relationship between the supervisor and subordinate; the cover-up was often linked with poor performance evaluations (indicative that most people fail at this type of impression management); and overtly lying negatively impacts the supervisor-subordinate relationship. In addition, 85 percent of managers claim that they will not promote someone who has been caught lying. Deception can cause permanent damage to business relationships. Organizational research has found that, when witnessing a series of untrustworthy actions, it is possible to regain trust by displaying a series of trustworthy actions. However, following outright deception, trust is never reestablished.

Steven Grover presents role conflict as a motivational force behind lying in business. Grover suggests that lying is caused by structural constraints and conflict, individual differences, and reward structures. Deception is more likely to occur when there are conflicting interests, such as during negotiations. Beyond personal interest, Piet Eenkhoorn and Johan Graafland discuss how deception in organizations is allowed to occur to monumental decrees, which include: corporate regulations, unethical accounting practices, unfair and excessive executive compensation, and poor policies that encourage profit and success over ethical practices, resulting in a failure to adhere to social norms to achieve the desired results.

Supporting the idea that deception increases when pressure to appear a certain way is applied, Brent Weiss and Robert Felsman studied deception in job interviews. In a study utilizing mock interviews (in which candidates were led to believe

that they could actually land a job), 81 percent admitted to lying at least once in the interview. Of the lies told, 90 percent were to improve the job applicant's image. Furthermore, most of the lies told directly related to job requirements. Some studies have reported that 53 percent of applicants falsified their resume, but only 11.6 percent admit to such falsifications. These deceitful impression management tactics are likely to continue once the applicant is hired.

In a Careerbuilder.com survey, 19 percent of respondents admitted to lying in the workplace at least once a week. Studies have found that the consequences of such lying in business include: an untrusting environment, impeding the flow of information, damaging the organization's reputation, lower job satisfaction, loss of ethical employees, and perpetuating an environment in which dishonesty is acceptable. Frequent lying in the workplace damages an individual's reputation by making him or her appear unreliable, untrustworthy, or unknowledgeable. Although deception often occurs in the workplace, people are usually not as equipped to detect deception as they think they are. In a review of over 253 studies, lie detection accuracy is about 53 percent accurate, only slightly better than chance or blind guessing. Even if the lie remains unrevealed, liars hurt themselves by being ill-prepared because deception impedes outcome preparedness.

Much like a candidate might lie to a potential employer, customers also lie to businesses in order to attain some desired outcome. However, this deception decreases outcome preparedness, or the deception interferes with the liar's ability to detect certain clues that indicate a specific positive outcome. This unpreparedness leads to decreased satisfaction. Liars are more focused on their deception and can miss key communications and feedback from the party they are deceiving.

In business transactions between organizations or clients, deception is also a common problem in negotiations. Bluffing is deceptive, but debate arises in deciding if bluffing in business negotiations is acceptable and ethical when it is almost always expected. Despite the debate, a 1990 survey of M.B.A. students, managers, and clergymen revealed that not a single respondent believed that lying during negotiations was ethical.

During negotiations, one study found that groups are inclined to lie in negotiations, whereas individuals are more likely to be honest. Setting an ethical organizational climate can help groups overcome this natural tendency. Sarah Stawaiski, R. Scott Tindale, and Amanda Dykema-Engblade reported that groups were less honest than individuals, consistent with past research. Their study also found that groups had a natural tendency to compete, and only when specifically told to be honest was there a significant decrease in lying. For individuals, the natural tendency is to be honest, and an increase in lying was only found when participants were told to be aggressive. Results showed that while deception resulted in a better outcome as measured by sale price, it was at the expense of feelings of guilt and stress for the liar. It was shown that individuals were less satisfied with their groups when told to be honest, possibly because the honesty interfered with the group's natural tendency to compete and succeed. Groups were also more motivated by the bottom line (money) than individuals.

The common use of technology in business today must also be considered. Lying, in general, has been found to be more common in phone than in face-to-face communications. However, one study found that e-negotiators reported that they were less likely to use competitive or unethical and deceitful negotiation styles, compared to face-to-face negotiations. One explanation for this hesitancy is the knowledge that the deceit would be documented in e-negotiations, whereas face-to-face negotiations are not always recorded or documented. However, the self-reported likelihood to lie has also conversely been found to be higher for e-negotiators in other studies. The commonality between e-negotiation and face-to-face negotiation studies is that significant differences were found in the lying that was dependent on the medium of the communication.

### **Business Scandals**

A common theme, or more accurately put, a common excuse for lying in business is that everyone else is doing it. Lying and deception have been found to often result in short-term advantages for the deceiver. Situations can be manipulated to a liar's favor, and if someone chooses not to be deceptive, they are opening themselves to

potential deception and are placed at a disadvantage. Take the Chiquita Banana scandal, for example. Chiquita confessed to making payments to terrorists in Colombia in an effort to protect the company's employees there and paid a \$25 million fine. Some Colombian terrorists, however, are now also claiming that Dole and Del Monte made similar payments. Dole and Del Monte deny making such payments and have avoided any fines. If the allegations are true, then the deception of Dole and Del Monte worked in their favor financially, compared with the loss experienced by Chiquita.

Large-scale corporate scandals are rarely the fault of every employee in the guilty organization, but often the culprits are a handful of executives. HIH Insurance in Australia, for example, lost \$5.3 billion because of the false and misleading statements of its director. Beyond the organization using deceitful tactics to beat the competition, there seems to be such an environment of corruption that too often executives of multibillion-dollar corporations are found guilty of lies and deceit, not for the advancement of the business, but to advance themselves. For instance, in 2005, the chief executive officer and chief financial officer of Tyco International were found guilty of stealing \$600 million from the company.

More often than not, corporate deception is discovered, despite every effort on the part of the company to conceal the corruption. One such instance is the Enron scandal, exposed in 2001, resulting in the largest bankruptcy in American history—\$63.4 billion. With over 20,000 employees, the energy company had the ability to affect the livelihood of thousands of workers. The firm handling the accounting for Enron, Arthur Andersen, helped Enron lie by illegally reporting increasing profits while concealing billions of dollars in debts. In addition to Enron's bankruptcy, Arthur Andersen was shut down in 2002, resulting in an additional 85,000 employees losing their jobs. When Enron's shares dropped from \$90.00 to 50 cents, thousands of employees and investors lost their savings. Enron, now Enron Creditors Recovery Corp., was unable to reverse the damage, and has since sold all of its North American power utility and gas assets. By 2011, Enron Creditor's Recovery Corp. paid over \$21 billion to creditors.

U.S. Department of Justice  
United States Marshals Service

# WANTED BY U.S. MARSHALS

NOTICE TO ARRESTING AGENCY: Before arrest, validate warrant through National Crime Information Center (NCIC). United States Marshals Service NCIC entry number: (NIC/ 2575089283).

NAME: ANTAR, Eddie  
ALIAS: STEWART, Alexander; ALEXANDER, Stewart; LEVY, Joseph; LEVY, Yosef; SHLOMO, Ezra Ben; "KELSO"; "CRAZY EDDIE"

DESCRIPTION:

|                                 |                               |
|---------------------------------|-------------------------------|

WANTED FOR: CRIMINAL CONTEMPT OF COURT  
Warrant Issued: District of New Jersey  
Warrant Number: 9050-0228-0111-F  
DATE WARRANT ISSUED: February 27, 1990

MISCELLANEOUS INFORMATION: ANTAR is a wealthy man and frequent international traveller. ANTAR speaks fluent English, French and possibly Hebrew. He has been described as a heavy drinker. ANTAR may be using an Israeli passport.

If arrested or whereabouts known, notify the local United States Marshals Office, (Telephone: \_\_\_\_\_).  
If no answer, call United States Marshals Service Communications Center in Arlington, Virginia.  
Telephone (800) 336-0102: (24 hour telephone contact or (800) 423-0719 (TDD). NLETS access code is VAUSMOOOO.

PRIOR EDITIONS ARE OBSOLETE AND NOT TO BE USED.

Form USM-132  
(Rev. 4/90)

*A 1990 arrest warrant is issued for Crazy Eddie Company cofounder Eddie Antar, the chief financial officer who "cooked the books" and helped his relatives skim nearly \$1 million per year from their stores, much of which he hid in Israel.*

Starting with Enron's collapse, the discovery of several major corporate scandals in late 2001 and early 2002 contributed to a drastic drop in stock prices. According to Dow Jones reports, from 2000 to early 2013, stocks reached their second-lowest point near the end of 2002 (the lowest point came in early 2009 during the Great Recession). Other large corporate scandals that occurred soon, Enron's crash and contributed to the 2002 market downturn, involved WorldCom, HealthSouth Corp., Tyco International, Xerox, Adelphia Communications, and ImClone Systems.

Business are often accused of deceptive accounting practices in order to avoid tax payments, inflate earnings, increase stock value, and increase market share. Some of the largest accounting scandals include Waste Management, a publicly traded U.S. company, reporting \$1.7 billion in fake earnings; WorldCom, a telecommunications company,

inflating \$11 billion worth of assets by under-reporting operating costs and creating fake accounting entries amounting to \$3.8 billion; HealthSouth, a publicly traded U.S. health care company, inflating over \$1 billion in earnings over a span of seven years; Freddie Mac, a mortgage-financing company, falsely reporting and under-reporting \$5 billion in earnings; Saytam, an Indian information technology services company, inflating revenues by \$1.5 billion; and Xerox, falsely reporting reoccurring income (obtained by leasing machines) as one-time transactions, leading to a \$10 million fine when discovered by the Securities and Exchange Commission. The accounting deception of these business resulted in lost jobs for employees, lost money for the shareholders, damaged reputations, jail time for the convicted culprits, and monetary fines targeting the organizations.

In 2009, Pfizer, one of the world's largest pharmaceutical companies, was forced to pay the largest health care fraud settlement and the largest criminal fine ever—\$2.3 billion for the illegal marketing of four drugs: Bextra, a painkiller; Geodon, an antipsychotic; Zynovox, an antibiotic; and Lyrica, an antiepileptic drug. Pfizer promoted off-label uses for Bextra as a pain reliever. Over half of Bextra's profits came from prescriptions written for uses that the Food and Drug Administration (FDA) had not approved. While doctors can prescribe drugs for off-label uses, drugmakers cannot market the drug for any use other than what the FDA approves. Bextra, for example, had been FDA-approved for treating rheumatoid arthritis, osteoarthritis, and menstrual pain. However, Pfizer promoted Bextra not only for off-label uses, but also distributed the drug in samples with dosages higher than the FDA-approved doses for rheumatoid arthritis and osteoarthritis. One whistleblower claimed that the Pfizer culture was driven by profit, encouraging deception and unethical sales techniques.

Insider trading is another example of deception in business. Executives have the power to unfairly use the information available to them to help their friends and family through insider trading. Insider trading is when business professionals leak confidential information about public corporations to their friends and family before the information is officially released to the public. These select few have an advantage in selling or buying stock,

based on information that is not publicly known. The chief executive and founder of ImClone Systems, a pharmaceutical company (since acquired by Eli Lilly), was sentenced to seven years for insider trading after he told his friends and family that the FDA rejected an ImClone Systems drug before announcing the news publicly. One of those insiders was Martha Stewart, who was sentenced to five months in prison for selling her ImClone Systems shares at a savings of \$45,673.

In addition to the bottom line (profits), businesses will also go to extreme measures to control their images and obtain information. The chairwoman of Hewlett-Packard (HP) hired a private investigator in 2006 to discover the source of boardroom leaks. The investigator went so far as to obtain the phone records of board members and journalists, resulting in an ethics scandal. No HP employees, however, were convicted of any crimes. Deutsche Bank in Germany was also involved in a scandal for spying on board members and investors. Such behavior in an effort to control business dealings often stems from the unethical and untrusting climate in business.

Corruption in business is so common that several countries have passed laws protecting whistleblowers in an attempt to stop corruption and deception. Such countries include the United States, the United Kingdom, Jamaica, Ireland, and South Korea. In the United States, the number of whistleblower cases received annually is on the rise, growing from 1,934 cases in 2005 to 2,787 in 2012. However, of the business ethics complaints filed from 2005 to 2012 in the United States, only 305 were determined to have merit warranting legal action.

### **Reducing Deception in Business**

In an effort to minimize the deception and unethical conduct that permeates business, many organizations produce a code of ethics that employees are expected to follow. Studies support that the presence of an ethical climate promotes honesty. For instance, when specifically told to negotiate a favorable contract, but to also avoid dishonesty, participants were significantly less likely to use deception, compared to situations in which the ethical standards were not emphasized. It is not uncommon for a code of ethics to consider the shareholders, consumers, environment, and/

or society at large. However, many organizations put the stakeholders first, meaning that profits and sales are still the bottom line.

Johnson & Johnson is a recognized industry leader in ethical behavior based on its credo, which states that the company will protect people first and property second. Johnson & Johnson puts consumers and health care providers first, employees second, communities (local and worldwide) third, and stockholders last. The company emphasizes profit as its last priority, preceded by safety, fair and ethical practices, contributing to charities, paying taxes, and protecting the environment. For example, after seven deaths in the Chicago area were linked to extra-strength Tylenol, Johnson & Johnson recalled the product and stopped all advertisements in 1982 to ensure public safety. The company was not responsible for the deaths (because of product tampering once it had reached the shelves), but took responsibility for its product, incurring over \$100 million in losses.

### **The Business of Deception**

Lying and deception have become businesses. Selling fake diplomas in the United States is a multimillion-dollar industry, and can easily be accomplished on the buyer's side through a simple Internet search. An estimation reported by Cable News Network (CNN) in 2010 claimed that over 100,000 fake degrees are sold in the United States each year. Another deception-based business, The Alibi Network, provides alibis and excuses to customers for a fee. Services even include providing proof of employment to a new potential employer or alibis for an employee taking a "sick day" from work. Beyond these types of businesses is the Ponzi scheme. A Ponzi scheme, named after Charles Ponzi, a 1920s con artist, is an investment scam in which investors are given "returns" through money acquired through additional investments. The largest Ponzi scheme to date is the Bernie Madoff scandal, in which investors were tricked into "investing" an estimated \$18 billion over the course of two decades.

### **Conclusion**

Individuals spend such a large percentage of their daily lives in the workplace that it would be impossible to remove lying and deceptive impression management in all organizations and

business dealings. Lying, in many instances, can maintain the status quo when change would be too disruptive (in alignment with utilitarianism) or can simply be used to avoid offending others. The competitive nature of the business world, however, can lead individuals and groups to what most would consider unethical and immoral behavior. For some, there might not be a clearly defined line of when it is appropriate and acceptable to deceive in business, like the widely used bluff or impression management. However, corruption in business, in the United States and worldwide, can have negative effects on individuals, organizations, nations, and the economic and natural environment of the world.

## Butterflies

Butterflies have evolved to include many different strategies that increase their chances of survival. They employ an array of tactics to avoid and/or deceive potential predators. Camouflage and mimicry are two major strategies used by butterflies to accomplish this protection.

There are several thousand different species of butterflies found around the world that belong to six or more families, depending on the system of classification followed, that comprise the subfamily Papilionoidea, which along with moths and skippers constitute the Lepidoptera order of insects. Most butterflies are brightly or strikingly colored, and are typically active during the day, which makes them vulnerable to predators. As natural protection against this predation, many species of butterfly utilize an array of defensive strategies. Chemical protection, built around toxic, repellent, or at least bad-tasting substances, make some butterfly species unpalatable to predators. The species that have developed this natural protection tend to be readily identifiable, and predators quickly learn, often after only one or two trials, to avoid attacking them. Other species

can mimic to varying degrees the physical appearance and behaviors of these protected species to also gain protection from these predators. Camouflage is another defensive strategy employed by some species at different stages of their lifecycle.

The lifecycle of a butterfly consists of four major stages: (1) the egg, (2) caterpillar or larva, (3) chrysalis or pupa, and (4) adult or imago. At either the caterpillar, chrysalis, and/or adult stages, camouflage and/or mimicry tactics may be employed. The caterpillars of many species are particularly adept at camouflage.

### Camouflage and Mimicry

Camouflage for butterflies consists of efforts to change external appearance or behavior to help them blend into or match their surroundings. Different environmental settings present myriad conditions that butterflies attempt to match. Through the use of different colors, patterns, and shapes, butterflies can attempt to look like the things around them. For example, the cassia (*Senna* spp.) is one of the host plants for the larva of the cloudless sulphur (*Phoebis sennae*) butterfly. When the cassia blooms, the larvae eat the flowers and turn yellow. The chrysalis of the cloudless sulphur butterfly is shaped and colored like a cassia leaf. When the adult butterfly emerges, it is yellow, like the large flowers of the cassia.

Mimicry is a strategy that butterflies use to appear similar to another butterfly species that predators avoid. During the 19th century, Henry Walter Bates, a British naturalist who studied butterflies in the Amazon, first described this type of mimicry, which is now known as Batesian mimicry. For example, many birds find the Viceroy (*Limenitis archippus*) butterfly very tasty, but some Viceroy butterflies have evolved to protect themselves by mimicking the appearance of the Monarch (*Danaus* spp.) butterfly, a species that birds generally find very foul-tasting. Another type of mimicry consists of using a body part to imitate another type of body part of another animal.

This type of mimicry is known as Mullerian mimicry, which is named after Fritz Mueller, a German zoologist who worked in the Amazon region three decades after Bates. Many butterfly species, for instance, have developed what appear to be large eye spots (*ocelli*) on their wings, and

these can be rapidly flashed by the flapping of their wings, which frequently startles a predator, allowing the butterfly to escape. For example, the owl (*Caligo* spp.) butterfly has eye spots that appear similar to those of an owl, which is a common predator of many birds that might, in turn, prey on the butterflies. The gatekeeper (*Pyroni tithonus*) and the grayling (*Hipparchia semele*) butterflies have eye spots that are used as decoys to divert bird attacks away from their vulnerable bodies and toward the outer parts of their wings.

The group of butterfly species related as mimics and models, such as the viceroy and monarch butterflies, is referred to as a mimicry complex. However, the relationship between the viceroy and monarch butterflies is more complex than simple Batesian mimicry. For instance, some genetic variants of Viceroy, such as some Florida viceroy (*Limenitis archippus floridensis*) butterflies, have evolved complex chemical defenses that make them somewhat unpalatable to bird predators. Monarch butterflies are unpalatable to predators because their larvae feed upon milkweed (*Asclepius* spp.) and sequester the bitter and emetic cardiac glycosides contained in the plants. Unfortunately for the monarchs, the concentration of cardiac glycosides decline as the adult butterfly ages. Consequently, the monarch butterfly that could be highly unpalatable while young, could convert and become more palatable later in life, which limits its ability to then serve as an effective model for mimics.

Further, testing has indicated that some viceroy butterflies are actually more unpalatable to some avian predators than some purported mimicry models (e.g., *Danaus gilippus berenice*). This suggests that some Viceroy butterflies are actually Mullerian mimics of the Monarch queens. In addition, some monarch butterflies are Mullerian mimics of other butterfly species, such as the common tiger (*Danaus genutia*) butterfly and the African monarch (*Danaus chrysippus*), also known as the plain tiger butterfly. Because the African monarch is relatively unpalatable, it generally flies in a straight line at a slow, leisurely pace, and it also usually stays close to the ground; this behavior gives potential bird predators more time to recognize and avoid it. Inexperienced predators, such as young, newly predatory birds,

may from time to time attack an African monarch butterfly. However, in addition to its defensive concentration of distasteful alkaloids, it has tough, leathery skin that affords some protection, and when attacked, it exudes a nauseating substance that makes it both taste and smell bad.

Other species of butterflies besides the viceroy have evolved as Batesian mimics of the African monarch (*Danaus chrysippus*). These include the danaid eggfly (*Hypolimnys misippus* form *inaria*) female and Indian fritillary (*Argyreus hyperbius*) females. Several other species closely resemble the African monarch, including the common palmfly (*Elymnias hypermnestra*) female, the Indian Tamil lacewing (*Cethosia nietneri mahratta*) male and female, and the leopard lacewing (*Cethosia cyane*) butterfly.

Another example of Batesian mimicry is that of the black and blue pipevine swallowtail (*Battus philenor*) butterfly, which is highly repugnant to predators. At least four other butterfly species, including the red-spotted purple (*Limenitis arthemis astyanax*), mimic the chemically protected pipevine swallowtail. The African swallowtail (*Papilio dardanus*) is another well-studied example of a Batesian mimic. All the males and nonmimetic African swallowtail females are white with black markings and have tails on their hind wings. Female African swallowtails are polymorphic and can appear in different forms in different regions varying according to the protective species present. Thus, in some regions, the female African

swallowtails may mimic the golden brown danaid (*Danaus chrysippus*); or in other places, they may mimic the black and white danais (*Ammauris* spp.). The females of another species of butterfly that do not have the chemical protection, and that also mimic the pipevine swallowtail, are eggfly (*Hypolimnys misippus*) butterflies. Consequently, mimicry and camouflage are employed by a wide array of butterfly species.

## Camouflage

Camouflage is the act of hiding or disguising the presence of a person, animal, or thing, or to conceal the existence of something undesirable. The word *camouflage* has its origins in World War I, from the French word *camoufler* (to disguise). In the military, camouflage is the disguising of objects used in war, whether concealing something large like a camp or a ship, or something smaller like a gun or a human. This type of camouflage may use textures, various colors of paints, nets, foliage, a change in landscape, or just about any technique needed to deceive the enemy from discovering what needs to remain secret. Camouflage enables troops to move into and stay in areas that keep them closer to the enemy, without being discovered. It can hide personnel and equipment and may even trap the enemy in an unknowingly dangerous position. Camouflage designs can be colorful or dull, depending on the circumstances and targets. Camouflage can conceal shapes and the traveling directions of these shapes.

### Methods of Camouflage

Two ways to conceal the location of something are to either cover it up, or disguise it to resemble the background so that it cannot be discovered. In nature, the colors of some animals are used to blend in with their surroundings, such as a polar

bear's white fur. The fur and scales of some creatures add texture to skin, preventing bright reflections from the sun.

The most useful colors for concealment are dull earthy colors, such as greenish browns, grays, or brick reds. Green is a favorite, but it can be difficult to maintain because it can become rather blue in color as it fades, and loses its concealment properties. There is very little blue-green in nature, and blue reflects light more than green.

Texture added to the color also enhances protection. If a smooth board and a rough bath towel are painted the same color, the board will appear lighter in tone because of its ability to reflect light. Texture can make a huge difference, especially in aerial views.

A design pattern known as “disruptive camouflage” is found throughout nature, such as the spots on a leopard, stripes on a zebra or tiger, or colorful rings on a coral snake. This disruptive camouflage technique was often used during World War I, and was known as the “dazzle” style.

### Camouflage in Military History

Throughout history, British soldiers wore brightly colored shields and plumes, eventually settling on red jackets. One of the reasons for such bold colors may have been to scare off the enemy, but occasionally, the uniform color was chosen to reflect their national color. Military leaders could

also sometimes watch from a distance and follow the success or failure of their men in battle. However, by the end of the 19th century, as the number of snipers increased, uniforms became less vibrant as troops realized that bright colors created easier targets.

Soon after World War I began, an English artist and royal academician, Solomon J. Solomon, began working with various textures and materials that could be used to hide trenches from enemy planes flying above. He convinced British military authorities to experiment with some of his ideas, and because they were familiar with the camouflage work of the French, they were encouraged with Solomon's proposals. Military leaders offered him the position of technical advisor for this project.

In 1915, Lucien-Vincent Guirand de Scévola, an artist in the French infantry during World War

I, determined that a team of talented individuals focusing only on the camouflage needs of the military was required. The British Royal Engineers officially set up the *section de camouflage* in 1916, and named it the Special Works Park, with Royal Engineer officer Lt. Col. Francis Wyatt in charge. Its priority was to conceal guns and gunners from the air. Solomon and other artists, painters, and designers were given temporary military rankings. Ultimately, the Special Works Park consisted of 60 officers and 400 men of other rank. As the war continued, troops began to realize the increased need for camouflage, and the requirements for this process continued to grow.

By 1917, de Scévola was in charge of a team of approximately 5,000 artists, painters, and designers, many of whom came from the theater. That year, the first published use of the word *camouflage* appeared in Britain in the *Daily Mail*, where

Camouflage, then and now: The "dazzle" style of camouflage (left) originated during World War I in 1917, when British Naval Lt. Norman Wilkinson introduced the idea that abstract patterns on a ship would interfere with a submarine's vision when a periscope was used to set the direction of a torpedo. A Navy Seal (right) demonstrates modern military concealment during drills on Virginia Beach, Virginia, July 17, 2004. Camouflage in the modern military varies from disguising one man to concealing several divisions.

it was stated that “The act of hiding anything from your enemy is termed camouflage.”

The “dazzle” style of camouflage originated in 1917, after the Germans succeeded in sinking over 900 British ships. Alarmed, British Naval Lt. Norman Wilkinson introduced the idea that colors painted in an abstract pattern on a ship could confuse an observer as to which direction the ship was traveling. This pattern would interfere with a submarine operator’s vision when a periscope was used to set the direction of a torpedo.

Wilkinson convinced the British Navy that there was a need to organize a dazzle department, and this agency was set up under his guidance in the basement of the Royal Academy of Arts in London. Here, artists painted models with contrasting tones of pale colors, black, and gray. Sharp, angular shapes with color were used to distort a ship’s outline and traveling direction, allowing it to blend in with the background. This type of painting continued with caution in various shipyards. Some doubted the effectiveness of such a scheme, whereas others touted its success. Wilkinson also traveled to the United States to help the U.S. government start a camouflage unit.

The British War Office set up the Camouflage Development and Training Centre in 1940, continuing with disruptive camouflage techniques during World War II. John Graham Kerr, a professor of zoology at Glasgow University, strongly believed that the creation of camouflage should come from biologists, not artists. He and others wrote that camouflage came from nature, and many of the artists responsible for concealment work were missing important principles of nature that scientists thoroughly understood. Artists, however, believed that a great knowledge of colors and their blending and contrasting capabilities were paramount to creating camouflage. Authorities eventually agreed that a variety of talents and skills, such as those of engineers, scientists, and artists, were needed to work together for effective camouflage.

### Modern Camouflage

Camouflage in the modern military continues to vary in degrees, from the disguising of one man to the concealment of several divisions. Deception with camouflage includes many processes, such as

using products especially developed for human skin. Earth-toned paints are spread over the face and other exposed areas of the body. Before the development of these paints, troops often used mud, soot mixed with flour, or even cow dung for human concealment.

To hide larger targets, netting mingled with leaves, twigs, and other elements from the surrounding terrain are utilized for cover. Vehicles may be used to create multiple paths to and from a camp so that enemy photographs show no clear direction of travel, and sometimes tracks are raked over to conceal all vehicle activity. When large amounts of dirt are removed from a site, it is taken away and scattered, instead of piled up in fresh mounds nearby. Another camouflage technique that even civilians use is to turn off lights after sundown.

New methods and processes for camouflage are constantly being explored. Currently, researchers are utilizing the antireflective properties of moth eyes on unmanned aerial vehicles (drones). A private company is developing what it calls an “invisibility cloak,” which makes it possible for a vehicle to blend into its surroundings by working over infrared frequencies. The U.S. Department of Defense is currently working to develop new camouflage designs for its military forces. Much has been learned in the 20th century regarding camouflage, and work is continuing toward more discoveries in the 21st century.

## Cardiff Giant

The Cardiff Giant was one of the most celebrated hoaxes of the 19th-century United States. This famous scam surrounded the discovery of a large stone sculpture, purported to be either an ancient statue or the petrified remains of an antediluvian giant being.

The Cardiff Giant was a 10-foot, 4.5-inch-tall stone statue of a man that was found on October 16, 1869, as laborers were digging a well behind the barn belonging to William C. “Stub” Newell in Cardiff, New York. Word of the colossal find rapidly spread and people began visiting Newell’s farm to view the marvel. Newell initially charged 25 cents and was soon charging a 50¢ fee to see the giant stone man.

Two major theories arose to explain what the Cardiff Giant might actually be. Some theorized that it was an ancient statue. Dr. John F. Boyn-ton was a leading proponent of this view; he suggested that perhaps a Jesuit missionary had carved it during the 17th century to help attract converts to his faith among the indigenous Native American people of the region. A competing theory was that the Cardiff Giant was the petrified remains of a member of an ancient race of giants. This petrificationist position was based on a biblical passage (Genesis 6:4) that referred to “giants in the Earth.” This view was particularly popular among Christian fundamentalists, who saw the find as substantiation of holy scripture.

However, it was all a clever ruse. An entrepreneur, George Hull, who was an atheist and failed tobacco farmer and cigar manufacturer from Binghamton, New York, devised the idea of burying a stone giant in the ground after having a heated discussion at Ackley, Iowa, with a Methodist revivalist, the Reverend Mr. Turk, who asserted that whatever the Bible said should be taken literally and at face value. This, of course, would include the reference to “giants in the Earth.” Hull, in collaboration with Newell, formulated an elaborate plan to create the giant figure.

Hull found a railroad construction site in Fort Dodge, Iowa, that had exposed a layer of gypsum, a soft, easily carved rock. He paid the grading crew a keg of beer for a block of gypsum measuring 12 by 4 by 2 feet. This three-ton block of

stone was wrapped in canvas and moved 40 miles to the nearest active railroad line; on the way there, its weight broke two wagons and a bridge, so one ton was cut away. Hull found Edward Burkhardt, a Chicago stone cutter from Germany, who with two assistants carved out the figure, whose face happened to resemble that of Hull. The stone cutters created special hammers, made of darning needles set in a lead base, to simulate skin pores, and they rubbed the statue with water, sand, ink, and sulfuric acid to produce an antique look. The final Cardiff Giant statue weighed in at 2,990 pounds.

Newell, Hull’s cousin, agreed to have the statue buried on his farm in exchange for a quarter share of interest in the scheme. The statue was carefully interred in November 1868. In October 1869, Newell hired two neighbors, Gideon Emmons and Henry Nichols, to help him dig a well, indicating where they should dig. After the statue’s surprising discovery, scholars and scientists came from colleges and museums to inspect it, and most declared it to be an ancient statue. Numerous other gawkers came to see the marvel. Newell fenced off the area around the find, hired a carnival barker, and continued charging a 50¢ admission fee.

The total cost of creating this deception was probably slightly more than \$3,000, but Hull and Newell recouped this investment and made a handsome profit besides; they raised an estimated \$20,000 from the admission fees alone. A syndicate of investors headed by David Hannum paid \$37,500 to purchase the Cardiff Giant and moved it to Syracuse, the nearest local city, where it could be more prominently displayed.

While in Syracuse, a paleontologist from Yale University, Professor Othniel C. Marsh, closely examined the Cardiff Giant and quickly concluded that it was a recently made fake. Marsh noted that there were fresh chisel marks visible on the surface of the statue, but these would have been worn smoother had the object actually been buried in the ground for as substantial a period of time as was claimed. Marsh also noted microscopic areas in cracks where the ink had not discolored the stone.

On December 10, 1869, Hull confessed to the fraud, perhaps spurred on by Newell’s telling of the story to his local friends when sufficiently

inebriated. However, people kept coming and paid a modest fee to view the Cardiff Giant. They even gave it the affectionate nickname of “Old Hoaxey.” The Cardiff Giant was also sent on exhibition to Boston and elsewhere, including an appearance at the 1901 Pan-American Exposition in Buffalo, New York.

In light of the continued public interest in the Cardiff Giant, the great showman P. T. Barnum offered the syndicate that now owned the colossus the amazing fee of over \$50,000 for a three-month lease so that he could exhibit it. When the offer was refused, Barnum hired an artist to surreptitiously produce an exact plaster and papier-mache replica of the statue, which was then placed on display at Barnum’s American Museum in New York City. To help attract larger crowds, Barnum offered a \$1,000 reward for anyone who could prove that his giant was less genuine than the Cardiff Giant. The replica was soon drawing more visitors than the original on display in Syracuse; this prompted the owners of the Cardiff Giant to file a lawsuit against Barnum, but the judge who was given the charges refused to hear the case unless the authenticity of the original could be conclusively proven. The charges, not surprisingly, were quickly dropped.

In 1876, Hull attempted to create another giant hoax in Colorado, but this scheme, known as the Solid Muldoon, was unsuccessful. There were several other 19th-century attempts to promote so-called petrified men, but none approached the fame of the Cardiff Giant. The Cardiff Giant is currently on display at the Farmer’s Museum in Cooperstown, New York. Barnum’s plaster replica is believed to be on display at Marvin’s Marvelous Mechanical Museum in Farmington Hills, Michigan.

## Cardinal Newman

John Henry Cardinal Newman was a significant religious figure in 19th-century Britain, influential both to the Church of England and the Roman Catholic Church. During this era, anti-Catholicism was a mainstay of English life, sometimes manifested in open meetings in which former Catholics denounced their beliefs and told disparaging stories regarding the church. Newman was sued for libel when, in a public forum, he cited a series of offenses committed by an individual who had made anti-Catholic utterances. Under English law that Newman needed to prove every charge he had made was true. He was unable to do so because of interference from the judge, so he was found guilty of misrepresentations, although documents were later found that proved his allegations.

### Background

Newman was born in 1801, the son of a London banker whose wife was a descendant of French Huguenot refugees. The eldest of three boys and three sisters, Newman’s parents were disposed toward the evangelical branch of the Anglican Church. After attending George Nicholas’s Great Ealing School, in 1816, Newman had an epiphany, converting to evangelical Calvinism and embracing many anti-Catholic opinions. He next enrolled at Trinity College, Oxford, where he studied a broad range of topics, and after graduating, he became a fellow of Oriel College, Oxford, considered by many to be the intellectual center of the Oxford University circle. By 1824, Newman had been ordained as an Anglican priest, and he was made the vice principal of Alban Hall the following year. In 1828, Newman became the vicar of St. Mary’s, Oxford, after which he became interested in what would be known as the Oxford movement.

The Oxford movement was composed of individuals who believed that ecclesiastical, liturgical, and theological matters should emphasize formality and a resistance to modernization. Sometimes considered to encompass the “high-church” faction, the Oxford movement advocated using a number of rituals more commonly associated with the Catholic Church. Newman, who possessed strong administrative skills and a keen intellect, soon became a leader of the Oxford movement, writing a variety of influential essays. Newman began writing a series of 90 publications, *Tracts for the Times*, issues of which ultimately were written by most of the movement’s leaders. The low cost and ready availability of the tracts helped make the objectives of the Oxford movement widely known, and catapulted Newman to a position of leadership among high-church Anglicans.

In 1839, Newman began to have doubts regarding the ascendancy of the Anglican Church, although he kept these misgivings private. In 1842, Newman left Oxford and moved to Littlemore, where he lived with a small group of adherents in monastic conditions. In 1843, Newman published an anonymous retraction of all criticisms that he had previously made of the Roman Catholic Church, and he formally converted to Catholicism in 1845. Ordained as a Catholic priest the following year, Newman moved to Birmingham, where he established a religious community where he would live for the next 40 years. Although Newman had converted to Catholicism in midlife, he soon became an apologist for his new faith.

### Libel Action

Although anti-Catholic sentiments had been present in Britain since the 16th century, by 1850, such feelings were especially heated. In that year the Vatican issued its papal bull *Universalis Ecclesiae*, which reestablished the Catholic diocesan system in England. Many Anglicans believed this was an attempt by the pope to reassert authority over Britain, and it was widely criticized in the press. Prominent Britons such as Prime Minister Lord John Russell stirred up anti-Catholic sentiments. As a result, many prominent Catholics sought to rebut this sentiment through an organized series of lectures. Newman was

called upon to present a series of lectures, and he booked the Birmingham Corn Exchange for this purpose. Newman planned to deliver nine lectures, and also prepared a series of pamphlets that contained the content of the lectures to be simultaneously distributed.

Earlier that year, Nicholas Cardinal Wiseman, the archbishop of Westminster, had written a pamphlet denouncing the apostate Dominican friar Giacinto Achilli. Achilli, based in Naples, had been removed from the exercise of his office by church authorities after repeated charges of sexual misconduct, and he was ordered to report to a remote monastery for three years’ penance. Instead, Achilli fled, joining members of the Protestant-led Bible Society on British-controlled Corfu. Achilli eventually made his way to London, where he joined the Evangelical Alliance, which at that point was involved in a debate with Cardinal Wiseman regarding Catholicism.

As Newman was preparing his lectures, he considered revealing the true reasons that Achilli had left the Catholic Church, namely his sexual assaults of women as young as 15 years old. Consulting his attorney friend James Hope-Scott regarding the advisability of bringing up these events as a way of denouncing and undermining the anti-Catholic movement, Newman was informed that because the allegations had already been published by Wiseman, the chances of a libel action were slight. As a result, in his fifth lecture, “Logical Inconsistency of the Protestant View,” Newman attacked Achilli by name, mentioning numerous actions against women, and the steps that the Catholic Church had taken to prevent these behaviors from recurring. In November 1851, Achilli brought a criminal action for libel against Newman.

Newman faced an unlimited fine and imprisonment of up to one year if convicted of libel. Because he had to prove that each of the 23 contested statements that he had made regarding Achilli was true, he wrote to Wiseman requesting documentary proof of the allegations contained in the cardinal’s pamphlet. Wiseman was unable to lay his hands on these documents, although he produced them after Newman’s trial. Newman next sent a group abroad to interview witnesses, including women raped by Achilli, and to bring some of them back to England so that they could

testify at his trial. At the trial, however, John Campbell, the presiding judge, who himself harbored anti-Catholic sentiments, refused to allow these witnesses to testify and attempted to stir the jury's prejudices against Newman. When the verdict was rendered in June 1852, Newman was found guilty on 22 of 23 counts. Although he was spared the expected imprisonment, Newman was fined 100 pounds and forced to bear legal fees of over 12,000 pounds, an amount equivalent to over 1 million pounds today.

Newman's expenses were paid for by a coalition of Catholics, who joined an international appeal to defray his costs. Although Newman was shaken by the verdict, public sentiment soon turned his way. In an editorial, the *Times* denounced the verdict, and suggested that the result diminished international opinion with regard to the English justice system; the editorial maintained that such prejudicial behavior blackened the English character. His reputation in tatters, Achilli was forced to flee to America, where he was again accused of engaging in adultery. Newman, on the other hand, was named rector of the newly established Catholic University of Ireland (now Trinity College, Dublin), and he published a series of lectures on education as *The Idea of a University* (1873). Returning to England after four years, Newman established a number of schools, and was named a cardinal in 1878. Newman died in 1890. Many colleges and universities today house Newman centers, which provide pastoral services to Catholics at non-Catholic institutions.

## Carnegie, Dale

Known chiefly as the pioneer of the self-help movement in the United States, Dale Carnegie became known around the world as a lecturer, newspaper columnist, radio figure, and the author of the best-seller, *How to Win Friends and Influence People*. First published in 1936, the book continues to sell well into the 21st century. Carnegie never claimed to be an original; he admitted to borrowing quotations from others that spanned both geography and time, including Abraham Lincoln, businessman Charles Schwab, educator John Dewey, columnist Dorothy Dix, Greek philosopher Socrates, and Chinese philosopher Lao Tzu.

Carnegie's personal story provides considerable proof that his tactics could be used to achieve success. He was born Dale Carnegie on November 24, 1888, in Maryville, Missouri. His parents, James William and Amanda Elizabeth Carnegie, were impoverished farmers. Carnegie attended but never graduated from Warrensburg State Teachers College. In 1908, he took on a job as a traveling salesman for International Correspondence Schools and for Armour and Company. Carnegie had honed the skills needed for these endeavors during his years as a high school debater and by attending public speeches that allowed him to glean knowledge on oratory from skilled speakers such as politicians and lecturers.

After a brief stint in which he tried acting in New York, he convinced the New York YMCA in 1912 to allow him to teach a class on public speaking for adults for 20 percent of his profits. He was soon earning \$500 a week. That same year, he established the Dale Carnegie Training Institute. The Dale Carnegie course was designed to teach sales personnel and business managers to increase productivity by keeping customers and employees happy. Carnegie courses included tips on firing employees without generating hostility and on using attitude rather than cash to create positive work environments.

Subsequently, Dale Carnegie became Dale Carnegie. While he has been accused of lying by claiming kinship with the family of financier and philanthropist Andrew Carnegie, Dale Carnegie never publicly claimed such a relationship. Nevertheless, in the minds of many people, the association was assumed.

Carnegie argued that the classic example of using charm to influence people by defusing a potentially explosive situation occurred in a speech given by John D. Rockefeller after the Ludlow Massacre of 1914, in which 18 people, including women and children, were killed during a coal mining strike. Without backing down an inch or conceding to the strikers' demands, Carnegie maintained that Rockefeller made the strikers believe that the Colorado Fuel and Iron Company had their best interests at heart.

Carnegie acknowledged that some people would always lie and attempt to deceive others, regardless of attempts to maintain honest relationships. In order to eschew controversy with such people, Carnegie encouraged his followers to avoid those masters of deception when at all possible.

### ***How to Win Friends and Influence People***

In 1936, Carnegie gathered together his material and published *How to Win Friends and Influence People*. Within a short time, the book sold 768,545 copies and became the best-selling non-fiction work of the early 20th century. Companies ranging from Westinghouse and the New York Telephone Company to the Philadelphia Chamber of Commerce used Carnegie's courses to train their employees. Government officials decided that the book could help in the rehabilitation of prisoners and began distributing it at Alcatraz, Leavenworth, and the Atlanta Penitentiary. Carnegie's core audience extended to community leaders and clubwomen. By 1938, he had begun writing a syndicated newspaper column, *On Success*, which aimed to spread his tactics to the American public. By 1949, Carnegie's courses were attracting some 15,000 people per week.

When Carnegie died in 1955, *How to Win Friends and Influence People* had sold more than 5 million copies. By 1988, 165,000 people in all parts of the world had enrolled in Carnegie courses. The institute had established chapters in 750 cities across the United States, and had spread to 15 other countries. By that time, *How to Win Friends and Influence People* had sold more than 40 million copies, and had been produced in every major language in the world. It had also been produced as an audio book. By 2013, Dale Carnegie training institutes had expanded to all 50 states and 80 foreign countries.

While supporters continue to praise Dale Carnegie for his honesty and sincerity, critics have labeled him a hypocrite. Carnegie's critics have argued that he taught people to use glib words and false cheerfulness to accomplish their goals. They further contend that it is lying to teach people how to win influence by telling others only what they want to know. Carnegie responded to his critics by insisting that intentionally influencing people and swaying them to a particular way of thinking was not lying. He compared catering influence to fishing, suggesting that it is necessary to provide people, like fish, with the bait that attracts them. Carnegie also believed that criticism was generally useless, and only served to alienate others. He maintained that a smile was the most successful tool in any would-be influencer's arsenal.

In a reexamination of *How to Win Friends and Influence People* that was written for a special issue of *American Quarterly* in 1977, Gail Thain Parker suggests that Carnegie was somewhat inarticulate in his personal conversations, often choosing to quote from his book spontaneously, rather than converse. She argues that the key to understanding Carnegie lies in understanding that he was interested in conveying attitudes rather than ideas. Parker faults Carnegie for laying the groundwork for the deceptions practiced in the self-help books written by "new feminizers" who surfaced in the wake of the women's movement of the 1960s and 1970s. In books such as Marabel Morgan's *The Total Woman* (1973), wives were taught to submit to their husbands, ostensibly agreeing with all decisions, and doing whatever was necessary to keep them happy.

In addition to the book with which he is so closely identified, Carnegie authored *Lincoln: The Unknown* (1932), *Little Known Facts About Well Known People* (1934), and *How to Stop Worrying and Start Living* (1948). Despite the many criticisms leveled against Carnegie and his methods, he remained enthusiastic about his work until the end of his life, and those methods have long outlived their founder. Amazon reports that the book continues to be one of its top sellers.

## Catholic Church

It is important to distinguish between Catholic teachings on lies and deception, and the controversies that have affected the Catholic Church that have provoked claims that the church has been deceitful in responding to issues such as sexual abuse. These are quite different areas; one has a long historical tradition, and the other controversies are of a more recent origin.

### Catholic Teachings on Lies and Deception

Catholic theology makes specific reference to lying and its relationship to ethics, morality, and sin. A fundamental basis of the Catholic Church's beliefs about lying and deception can be found in the Eighth Commandment: "You shall not bear false witness against your neighbor." Furthermore, because God is the source of all truth, his followers are called upon to live truthful lives and shun lies and deception. Both in word and deed, Catholics are called upon to live truthful lives.

Three types of lies that have been identified by Catholic leaders are injurious or hurtful lies, officious lies, and jocose lies. Injurious lies hurt

the person who is the subject of the deception. Officious lies are made to avoid hurting someone; sometimes, these are called "white lies." Jocose deception involves lies told for amusement and meant to be understood by everyone as a joke. They are not intended to be harmful, and most people, including Catholics, do not consider them lies at all.

The writings of Saint Augustine are another major influence on Catholic theology about lies and deception. He believed that it was never appropriate to tell an injurious or jocose lie because lying is the opposite of the virtue of truth and veracity. Lies are often associated with hypocrisy, further demonstrating their unethical nature. Friendships and trust are formed on the basis of honesty among people; lying destroys this basic foundation of relationships. For Catholics, the end never justifies the means.

In the 16th century, Saint Thomas Aquinas played a major role in defining Catholic beliefs about lying. He defined lying as "a statement at variance with the mind."

Forms of deception that are similar to lying include flattery, which is not malicious, but is still designed to provide a false impression. Such adulation, which is not justified by either the desire to help and serve or the possibility of friendship, is considered inappropriate by Catholics. Boasting and bragging are other forms of duplicitous exaggeration, and are also offenses against the truth. Irony or sarcasm, aimed at maliciously hurting someone, are other forms of behavior that are an offense against the truth.

The seriousness of a lie depends on the amount of harm suffered by the victim, the liar's intentions, and the circumstances in which the lie is told. A lie becomes unforgivable when it does injury to justice and charity.

The purpose of communication is to share the truth with others, so lying is condemned by its very nature. Lying and deception are against the basic Catholic principles of justice and charity. They are a form of violence and disrespect toward others, and they sow the seeds of many other sins.

Catholic teaching suggests that every sin requires reparation, even if the person is forgiven. Such reparations can involve apologizing or making amends to a particular person, making donations to charity, and other acts to address the

harm done to another person. These are the types of acts that Catholics are obligated to perform in order to clear their consciences when they have sinned against others by lying.

### Sex Abuse Scandals

The sex scandals that have affected the Catholic Church involve children as young as 3 years old (but mostly between the ages of 11 and 14) who claim to have been sexually abused or assaulted by priests and members of the Roman Catholic orders (such as nuns or Christian brothers). The vast majority of victims have been male. Many of these cases have been tried as criminal offenses and have resulted in convictions, but the role of the church in responding to the cases has embroiled it in controversy. Critics claim that leaders within the Catholic Church either ignored, or willfully covered-up, cases of abuse. In some cases, critics charge that priests were simply transferred, or even internationally moved, without the church notifying police and criminal prosecutors of the alleged behavior.

A study by researchers at John Jay College of Criminal Justice funded by the U.S. Conference of Catholic Bishops found that of the 94,607 U.S. priests for the period 1960 through 2002, 4,392 priests were alleged sex abusers. This amounted to 4.3 percent of the total number of priests in the church during that period. Police were contacted in less than one-quarter of these cases, and 252 priests whose actions were reported to police were convicted, with at least 100 serving prison time. This means that only 2 percent of the number of priests who were alleged to have engaged in sexual abuse served time in prison.

According to one report, there have been approximately 14,000 lawsuits alleging abuse against Catholic clergy since 1950, and the cost of court settlements is estimated to be approximately \$2.3 billion.

A 2009 Irish government inquiry into the level of abuse at Catholic institutions for young boys found that abuse was “endemic” in the institutions. More than 2,000 people testified before an inquiry that they had been personally abused in these institutions. Another 2009 Irish inquiry found that the crimes of 46 priests in the Dublin area had been covered up. In 2011, a third inquiry by the Irish government concluded that

the Catholic Church is not proactive in responding to allegations of abuse.

The debate over alleged sexual abuse has shaken the standing of the Catholic Church in the eyes of many people—not simply because of the betrayal of trust and degree of evil involved in the actions of the perpetrators, but also because of the wider allegations that the church has not been fully honest about its knowledge of child molesters and pedophiles within its ranks. This issue—one in which critics allege that church officials have engaged in lying and deception—has been at the core of debates over the church’s response to child abuse.

## Caveat Emptor

*Caveat emptor* is a Latin phrase that when literally translated means “let the buyer beware.” The phrase comes from two separate new Latin words: *emptor*, or “buyer,” and *cavere*, the verb for “caution.” The caveat emptor warning is most pronounced when the purchaser assumes the risk that the product is defective or unsuitable for his or her needs. Caveat emptor is not a transfer of responsibility to protect a seller who chooses to engage in fraud by making false statements or by issuing misleading representations about the quality or condition of a product. The caveat emptor warning simply reiterates and summarizes the concept that purchasers must inspect and examine for themselves any product considered for purchase, the failure of which may be considered negligence on the part of the buyers.

The concept of caveat emptor is believed to have been used as far back as ancient Rome as a rule for buying within the marketplace. The earliest recorded uses, however, were in medieval England as common law protection established by the English Parliament against unfair dealings within consumer transactions. Some scholars believe that the 1817 Supreme Court case of *Peter Laidlaw and Company v. Hector M. Organ* was the first to codify as rule of law in the United States the issues of duty to disclose concerning what information sellers were required to disclose or keep to themselves. The concept of caveat emptor, however, did not become widely used until the dawn of the Industrial Revolution, when the buying and selling of manufactured products and real estate became a fast-paced, mainstream market.

Since the time of the Industrial Revolution, the premise behind caveat emptor has been a valuable doctrine used for buyer protection. The idea of “let the buyer beware” was especially valuable to emerging, large corporations because it put the duty of inspection on the buyer, rather than the seller. The seller of goods could effectively make false representations about quality, without fear of repercussion.

The tide began to turn toward greater consumer protection in 1914, when the Federal Trade Commission (FTC) mandated that companies had a “duty to disclose” all known defects

and accurately portray the value of the goods that they produced. Prior to the 1960s, however, the duty to disclose was not a strictly enforced practice, despite the 1914 FTC Act. Instead, large corporations still denounced the implied warranty of merchantability and fitness for use under the theory of caveat emptor, placing the burden on the buyer to have the product examined prior to purchase, despite all statements by the seller regarding the value, maintenance, or condition of the product. During the 1970s, however, consumer protection laws were further codified under the Uniform Commercial Code, essentially eliminating the outdated theory of caveat emptor altogether.

Since the 1970s, these consumer protection laws have helped regulate the relationship between buyers and sellers, protecting buyers from sellers who actively engage in illegal acts such as false advertising and failing to disclose known defects. Today, consumer protection laws create a duty to disclose upon sellers that serves as an exception to any legal defense of caveat emptor. Over time, real estate and consumer transactions, as well as manufacturing and advertising, became more complex, necessitating more regulation than what could be addressed by common law concepts of caveat emptor, now considered a highly inequitable imposition upon a buyer. Such regulations effectively obliterated the seller’s claims of caveat emptor as a safety net for sellers who wished to use it as an excuse for poor advertising practices. Interestingly, although the express codification of consumer protection appears to make the claim of caveat emptor obsolete, the resulting legal loopholes have also given rise to the claims of caveat venditor (let the seller beware) and caveat emptor light.

### Caveat Emptor Light

Recent economic instability, failures of oversight within the banking industry, and large corporate bailouts by the government have resulted in consumers who are even less trustful of large corporations, as well as government and court protections once ensured under the existing consumer protection laws. This lack of faith has led to a rise in privately funded transactions, especially in real estate. Consumers no longer trust that corporations are accurately representing themselves or

their products and have again adopted the ideology that the buyer should beware when engaging in such transactions. Even though the legal defense of caveat emptor may be outdated, it still seems to affect private consumer transactions in the revised, smaller doctrine of caveat emptor light. This revised theory of buyer prudence in knowledgeable transactions is applied to help keep consumers safe in private transactions that are not otherwise regulated by the Uniform Commercial Code.

Especially used in private real estate transactions, and taught to real-estate brokers and agents, caveat emptor light encourages diligent buyers to have private inspections done, and educates sellers as to what they are, or are not, required to disclose when selling their home. The necessity for a buyer to examine the product, or land in the case of real estate, for condition and appropriateness of title to be transferred is the prerequisite of diligence for equitable claims of relief in which the buyer seeks to be made whole upon transactions in which the buyer has the implied duty to beware.

Caveat emptor light may help consumers avoid the pitfalls of false advertising because, while a little puffery of a product may be expected, it is still incumbent upon a consumer to do research about the product in question before purchasing. Whether it is lying and deceit by a major company or by a neighbor selling a car, the concepts of caveat emptor are still worthy precautions for a buyer from those who might purposefully engage in false representations.

## Central Intelligence Agency, U.S.

The Central Intelligence Agency (CIA) is the bureau of the U.S. government charged with providing national security intelligence to other federal agencies and the military. Created in 1947 to succeed the Office of Strategic Services (OSS), the CIA was responsible for coordinating and leading all intelligence activity conducted by the U.S. government and its agencies. While this changed after 2004, the CIA is still the primary source of intelligence information regarding foreign governments, corporations, organizations, and individuals, and also conducts tactical operations in the field, some of which are covert.

At various times over its history, leaders and agents of the CIA have been accused of lying or engaging in other deceptive practices that have caused skepticism about the reliability of the agency's work. The CIA has also been charged with relying too much on information sources that are at best unreliable and at worst purposefully providing incorrect or inaccurate information to the agency, which has caused the U.S. government to make decisions that have been costly, and even harmful to citizens of the United States and other countries.

#### Background

Although intelligence had been gathered for use by the military and government agencies since the Revolutionary War, there was no centralized system to coordinate this information until World War II. Before this, various branches of government, including the U.S. Army, Navy, State, and Treasury departments, maintained

*General David Petraeus shakes hands with his biography author Paula Broadwell, July 13, 2011. Sworn in as Central Intelligence Agency (CIA) director with his wife, Holly, by his side in September 2011, Petraeus began an extramarital affair with Broadwell two months later, creating yet another deception scandal for the CIA. The Federal Bureau of Investigation discovered a private Gmail account where Petraeus used an alias.*

separate intelligence-gathering offices. There was no coordination or cooperation between these different offices, and there was often duplication of efforts. After the United States entered World War II, President Franklin D. Roosevelt sought to improve the control and direction of intelligence gathering conducted on behalf of the United States. To that end, Roosevelt formed the Office of Strategic Services (OSS) by means of a military order on June 13, 1942. The OSS was charged with collecting and analyzing intelligence data needed by the military during the war. As a result, the OSS provided the military with reports containing facts and analysis, although it did not have the sole responsibility for intelligence gathering internationally. The Federal

Bureau of Investigation (FBI) maintained control of information-gathering in Central and South America, while the Army and Navy jealously maintained control of their own intelligence infrastructure.

After the allied victory in World War II, President Harry S. Truman dissolved the OSS by means of an executive order in October 1945. At that point, the OSS's Strategic Services Unit, which was responsible for clandestine intelligence and counterespionage, was absorbed into the War Department. The Interim Research and Intelligence Service, which conducted analyses on intelligence, was moved to the State Department. The Psychological Warfare Division, which focused on morale and propaganda, was split between the War Department and the Army General Staff.

In early 1946, however, President Truman formed the Central Intelligence Group, which reclaimed some of these powers, despite fierce opposition from the State Department, the War Department, and the FBI. By the next year, the National Security Act of 1947 established the CIA, which was initially led by Roscoe H. Hillenkoetter.

First authorized to carry out covert operations in 1948, the CIA was next allowed to use confidential fiscal procedures, which exempted its budget from customary oversight and transparency related to federal expenditures. Although it took the lead role in foreign intelligence gathering and participated in international crime investigations, it possessed no domestic police authority. Instead, the FBI was responsible for domestic law enforcement, and the CIA also shared some authority with the U.S. Army Special Forces, with whom it shared some resources.

The CIA chiefly focused on gathering intelligence information, which it continues to do today, although its role has changed over time. Pressure was exerted on the CIA throughout the last four decades of the 20th century to both gather the best intelligence available while also eschewing practices that involved lying and deception. This pressure often resulted in the CIA attempting to reach what some felt were mutually exclusive goals.

Through 2004, the director of the CIA also served as the manager of the U.S. intelligence

community, meaning that the position oversaw intelligence efforts, served as the chief intelligence advisor to the president, and provided other services as needed. In the aftermath of the September 11, 2001, attacks, however, Congress passed the Intelligence Reform and Terrorism Prevention Act of 2004, which created a new office that oversees all intelligence, the Director of National Intelligence (DNI). The DNI has taken over some of the responsibilities and functions that had previously been under the purview of the CIA, and the CIA now reports to the DNI, rather than the president.

### Controversies and Disagreements

Although the CIA largely works in secret, a variety of events have caused critics concern regarding the veracity and reliability of its reports and the integrity and ethical nature of its actions. Intelligence collection often involves lying and deception, yet the public and Congress have increasingly demanded more openness about how the work proceeds. Certainly the clandestine nature of much intelligence work requires the CIA to be less than completely transparent with regard to its work. Unlike other federal operations, the CIA's budget and other important information related to its management are confidential and are not released for public scrutiny. While this different role is accepted by most, at various times, disclosures of covert actions by the CIA have included misrepresentations to other governments, the press, and even the agents of the executive branch. This has caused skepticism of the CIA's actions and has raised questions regarding the quality of its intelligence and analysis.

During the 1950s, for example, the Cold War between the United States and the Soviet Union made procuring intelligence information about the nation difficult for the CIA. Allen Dulles, the CIA's director and brother of Secretary of State John Foster Dulles, was given more leeway regarding covert operations than his predecessors. Unable to receive reliable information about military installations within the Soviet Union, the CIA initiated a series of reconnaissance flights over Soviet airspace by aircraft equipped with especially sensitive camera equipment. The Lockheed U-2, which remains in use in the 21st century, was especially developed for high-altitude,

all-weather intelligence-gathering. The U-2 aircraft, which can operate day or night, flies at an altitude of 70,000 feet, which makes its detection difficult. Because military aircraft entering another nation's airspace without authorization can be construed as an act of war, the CIA flew the U-2s under its own operation, known as Project Dragon Lady. Beginning in 1957, flights from U.S. bases in Pakistan provided the United States valuable intelligence regarding the Soviet military capacity. On May 1, 1960, U.S. pilot Francis Gary Powers flew a U-2 plane on a mission to photograph intercontinental ballistic missiles (ICBMs) and a plutonium processing center before landing in Norway. Detected by the Soviets, Powers's plane was intercepted by missiles and he was captured after bailing out.

The initial U.S. response was to send news releases four days later, alleging that a plane had gone missing over Turkey. Believing Powers to be dead, the United States stated that the U-2 had been a weather research aircraft that may have strayed into Soviet airspace after experiencing "oxygen problems." The Soviets then disclosed that they had captured Powers, and that the plane was still intact. A peace conference planned for Paris collapsed, and the Soviet Union convened a meeting of the United Nations Security Council to expose untruths by the CIA and the U.S. government. The U-2 incident caused the U.S. government great embarrassment, and sowed the first seeds of doubt regarding the CIA's veracity and practices.

Between 1953 and 1959, Cuban insurgents led a revolution against the pro-U.S. government of President Fulgencio Batista. Concerned with the close ties that the new Cuban government was forging with the Soviet Union, President Dwight D. Eisenhower authorized the CIA to spend \$13 million to overthrow the Cuban government. In its efforts to overthrow the government led by Fidel Castro, the CIA collaborated with the Mafia and Cuban dissenters to train a group known as Brigade 2506. Recruiting over 1,400 men to be members of the brigade, the CIA trained the insurgents in a variety of locations, including Florida, Kentucky, Georgia, and Mexico. In mid-April 1961, members of Brigade 2506 landed near the Cuban Bay of Pigs, leading to a series of battles that were ultimately won by the

Cuban government. The defeat embarrassed the administration of President John F. Kennedy and strengthened Castro's ties with the Soviet Union. Although President Kennedy first asserted that the Bay of Pigs action was the effort of Cubans dissatisfied with the Castro government, the CIA's role in recruiting and training Brigade 2506 soon came to light. This series of untrue statements caused the Kennedy administration some negative press, and made many people question the policies of the CIA. The acknowledgement of lying and deception by CIA agents reduced support for the organization and its mission.

During the Vietnam War, the CIA was harshly criticized by many who did not favor the involvement of the United States in the conflict. CIA analysts were involved in assessing the political strength of the South Vietnamese government as early as 1954, and many of their reports were less sanguine than those of the U.S. military. Numbers contained in reports that the CIA provided the White House during the 1960s and 1970s were allegedly changed so that political support for the conflict would not diminish. This deception was related to increasing numbers of American casualties, which made the war unpopular with much of the electorate. By the mid-1970s, allegations regarding abuses of the CIA's power grew stronger, as Congress attempted to reassert control over the agency. Congressional hearings elicited stories of assassinations of foreign leaders and spying on U.S. citizens.

After former CIA operatives were involved in the burglary of the Democratic Party's National Committee offices in the Watergate office complex in 1972, the agency's standing fell to an all-time low. The situation was exacerbated when President Richard M. Nixon attempted to have the CIA interfere with the FBI's investigation into the Watergate break-in and subsequent coverup. These actions caused a loss of public support for the CIA, and in an era when the power of the executive branch was weakened, disclosure of these deceptive practices created a groundswell of support for change and reform.

### Response to Past Deceptions

James Schlesinger, the CIA director, moved to examine the allegations of past illegal activities, including those involving lying and deception, on

the part of the agency. To that end, he commissioned a series of reports that became known as the Family Jewels. In late 1974, the *New York Times* ran a series of stories about the Family Jewels, immediately drawing negative attention to the CIA. In these articles, the *New York Times* alleged that the CIA had used the hallucinogenic drug LSD in experiments with human subjects who had not given informed consent for this, assassinated foreign leaders, and conducted illegal surveillance on thousands of Americans involved in the antiwar movement. After Schlesinger left the CIA to become the secretary of defense, his successor, William Colby, was forced to deal with questions from multiple fronts related to the policies of the agency. The relationship between Congress and the CIA became increasingly strained as the Family Jewels reports indicated that the CIA had lied to and deceived members of Congress in the past.

The U.S. Senate formed a committee under the leadership of Senator Frank Church (D-Idaho) to explore the actions of the CIA, and the House of Representatives convened a similar committee chaired by Congressman Otis Pike (D-New York). As a result of these committees, Colby testified before Congress over 30 times in 1975, forced to answer questions about the policies of the CIA and its lack of truthfulness with previous congressional committees. President Gerald R. Ford also became involved in the evaluation process, issuing an executive order prohibiting the assassination of foreign leaders, and convening a committee of his own under the chairmanship of Vice President Nelson A. Rockefeller. Both members of Congress and representatives of the executive branch distanced themselves from the CIA's actions, leading to the public perception that it was a rogue agency that eschewed respect for the legislative process or the chain of command necessary to conduct foreign policy. Public opinion demonstrated reduced support for the CIA.

During the 1980s, further controversy kept the CIA in a position where it was on the defensive with both Congress and the public. In 1986, reports surfaced alleging that the administration of President Ronald Reagan had negotiated the sale of weapons to Iran, then under an arms embargo, and used the proceeds from these sales

to fund various rebel groups (the Contras) who opposed the government of Nicaragua, an action that had also been prohibited by Congress. These transactions, which required lies and deception to achieve, had been facilitated by the CIA. A member of the National Security Council, Lt. Col. Oliver North, was charged to have implemented the plan, and it was alleged that officials as prominent as CIA Director William Casey, Secretary of Defense Caspar Weinberger, and even President Ronald Reagan had been involved in the scheme. Although Reagan initially denied the transactions, he later admitted that they took place and took full responsibility for them, although he denied knowledge of the scheme.

Reagan appointed a bipartisan committee led by former U.S. Senators John Tower and Edmund Muskie to investigate the matter (the Tower Commission), and the panel found fault with the president's lax management style and lack of oversight of the CIA and others. Although North, Weinberger, and others were indicted for their actions, pardons issued by President George H. W. Bush took care of many of the chief players, while other convictions were overturned on appeal.

The Intelligence Authorization Act of 1991 was a direct attempt to constrain the CIA from engaging in behavior that was not in keeping with U.S. and international laws. Specifically, members of Congress codified their desire to be kept abreast of actions involving the CIA. The act mandated that all covert operations of the CIA must be approved by the president, and that all parties involved in secret operations must be listed and shared with Congress on a regular basis. In 1993, further legislation restructured the agency, increasing the level of documentation required for CIA operations. These actions were later criticized for unduly restraining the CIA, making it more difficult to assemble the intelligence reports necessary to protect national security.

In the aftermath of the 9/11 attacks, these changes were believed by some to have prevented the CIA from determining the movements of certain terrorist groups because of difficulties engendered in complying with these regulations. After the passage of the Intelligence Reform and Terrorism Prevention Act of 2004, a newly created office of the Director of National Intelligence assumed many of the intelligence community functions

that the CIA and its director had previously held. The CIA now reports to the Director of National Intelligence (DNI), one of 16 agencies reporting to this agency.

## Charles II Plot

The plot to kill King Charles II of England (also known as the Popish Plot) was supposedly a plan to kill the king and replace him with his Roman Catholic brother James, the Duke of York. Although there was no plot, many people believed the story.

In the year prior to the plot, English public opinion was inclined to believe anti-Catholic rhetoric. Many Londoners had blamed the Catholics for the Great Fire of 1666. The fire, which lasted from September 2 to 5, destroyed much of the city, forcing many Londoners to evacuate. Robert Hubert, a French Catholic, confessed to having started the fire, even though he did not actually arrive in the country until two days after the fire started.

Despite the questionable nature of Hubert's claim that he was a French spy in service of the pope, the Frenchman was convicted and executed because it suited the needs of those in Parliament who believed that Charles II was sympathetic to Catholics. Catholics, who constituted less than 10 percent of England's population, became convenient scapegoats for all of the country's ills, so a claim that Catholics were behind a plot to kill the monarch had a receptive audience.

The plot was the creation of Titus Oates, an Anglican priest who had become a Catholic in 1677. He entered Jesuit seminaries, but was expelled from the seminary in St. Omer in France in June 1678. After his expulsion, Oates returned to England, where he shared with Dr. Israel Tonge his stories of plots by Jesuits, including the plot to kill the English monarch.

### Catholic Scapegoats

Tonge and Oates wrote a manuscript detailing the Catholic conspiracy against the king. They claimed that the leaders of the Catholic Church in Great Britain had approved the assassination plot, which was to be carried out by the Jesuits. Allegedly, the English Catholics had entered into a conspiracy with King Louis XIV of France to raise an army of 50,000 men who would seize the country and kill the king, place his brother (who was Catholic) on the throne, and murder thousands of Protestants. No such plot existed, but Oates's story was readily accepted by English

Protestants who feared the possibility of James, the Duke of York and a Roman Catholic, ascending to the throne if his brother died. Charles II had himself become a Catholic in 1670, but kept this a secret.

The king was informed of the plot by Christopher Kirkby, a chemist, and Tonge. Charles II, who did not really take the plot seriously, turned the investigation over to Thomas Osborne, Lord Danby, the lord high treasurer. Osborne was an opponent of the Roman Catholic Church in Great Britain, having opposed Charles II's 1672 Royal Declaration of Indulgence, which suspended criminal sanctions against those who did not conform to the Church of England or were Roman Catholics. Osborne also was a supporter of the 1673 Test Act, which barred nonconformists and Roman Catholics from public service or public office. Unlike the king, Osborne was interested in pursuing the plot. Tonge decided to have Oates tell his story, under oath, to Sir Edmund Geoffrey, a magistrate. Oates testified before Geoffrey on September 6, 1678. On October 12, the magistrate disappeared, and his body was found a few days later, which only heightened the belief that Oates's story had some merit and that the Jesuits had killed him to insure his silence.

Osborne had Oates brought before the Privy Council on September 28, 1678, where he presented his charges. He claimed that hundreds of Catholics were involved in the plot. Many of those accused by Oates were prominent Catholics, or had connections to Catherine of Braganza, the king's Roman Catholic wife. Sir George Wakeman, Catherine of Braganza's doctor, was accused by Oates of having turned down 10,000 pounds to poison the king because he wanted more money. Oates claimed that the doctor had agreed to poison the king when the offer was raised to 15,000 pounds. Another person charged by Oates was Edward Colman, the one-time secretary to Mary of Modena, who was the Duchess of York (the wife of the king's brother) and a Roman Catholic. Colman, who had been forced from office by Osborne, had been in contact with officials in the French government and French Jesuits, giving credibility to Oates's charges. Colman was charged with high treason, and Oates testified against him, claiming that he had carried letters to the French for Colman and had witnessed a

meeting in which the plot to assassinate the king was discussed. Letters seized from Colman's home were also placed in evidence against him. While Colman acknowledged having corresponded with the French, he said that the communication had stopped in 1674, and that he had never conspired to kill the king. Despite his declarations of innocence, Colman was convicted and executed on December 3, 1678. Wakeman was indicted for high treason in July 1679, but was acquitted at trial despite the testimony of Oates.

Others accused by Oates included Dr. William Fogarty; Peter Talbot, the Roman Catholic archbishop of Dublin; John Belasyse, 1st Baron Belasyse; Henry Arundell, 3rd Baron Arundell of Wardour; and William Herbert, the Earl of Powis. Oates identified 81 individuals who he claimed were part of this plot, and they were rounded up by Lord Danby to face prosecution.

In November 1678, Oates claimed the queen, Catherine of Braganza, was conspiring with Charles II's doctor to poison him. The queen was Roman Catholic, and her complicity in a plot could be easily believed by those fearful of the "papist plot." Charles, who had been skeptical of Oates's allegations in the first place, interviewed Oates, concluded he was lying, and ordered his arrest. However, within a few days, Parliament demanded that Oates be released. Charles, who had been forced from England and spent nine years in Europe after the execution of his father and his defeat by Oliver Cromwell at the Battle of Worcester in 1651, acceded to Parliament's wishes, and Oates was freed. Upon his release, Oates was given a state apartment and an allowance of 1,200 pounds a year.

The campaign against the "plotters" continued. At one point, Oates claimed that the king would be shot with silver bullets so that his wounds could not be treated (although there was no evidence of such a plot or that silver bullets caused untreatable wounds). Over the next three years, 15 innocent men were executed. By the middle of 1681, the English courts began to declare more people innocent, and opinion turned against Oates.

In August 1681, Oates was told to leave his apartment. He was then arrested for sedition, fined 100,000 pounds, and thrown into prison. When James II became king after Charles II's death in 1685, he had Oates retried, and Oates

was convicted of perjury. His punishment was life imprisonment, with the additional sanction of being "whipped through the streets of London five days a year for the remainder of his life." In 1689, following the Glorious Revolution, Oates was pardoned by William III of Orange and Mary II and was granted a pension of 260 pounds a year. Oates died on either July 12 or 13, 1705.

While the plot may have come to an end, the persecution of Catholics continued. The Popery Act of 1698, enacted by Parliament in 1700, offered rewards to those who would turn Catholic priests into the authorities; this law was not repealed until 1846. The Act of Settlement (1701) bars a Catholic from becoming the monarch. It was not until 1778, with the passage of the first Catholic Relief Act, that Roman Catholics were permitted to own and inherit property and join the army. However, the American Revolution and wars with France, Spain, and the Dutch Republic, were protested by Protestants who feared that Catholic soldiers would join with French and Spanish soldiers to invade Great Britain. In June 1780, a march on Parliament turned into a riot against the law (the Gordon Riots), with buildings owned by or associated with Catholics attacked by the mobs. It was not until 1829 that Catholics were given the right to vote or were permitted to hold public office, rights that had been taken away a century and a half earlier in a climate that fostered the creation of Oates's plot and fed the anti-Catholic hysteria of the age.

# Cheating

Cheating can generally be defined as an immoral and socially undesired behavior that can lead to lying about the behavior in question in order to avoid punishment. What is accounted as an extreme kind of immoral and socially undesired behavior is manifested in written rules and laws. A more precise definition of cheating, and what behaviors are seen as cheating behaviors, depends on the context in which a person cheats (e.g., in academics, romantic relationships, industry/organizations, or sports). Concerning research on cheating, the academic context is one of the most prominent ones. People cheat in order to gain advantages. More specific reasons for cheating depend on the context in which the behavior takes place.

Synonyms for cheating also depend on context: In the academic context, the synonym is academic dishonesty; in a romantic relationship, unfaithfulness or infidelity; and in the industrial/organizational context and in the sports context, fraud. In an academic context, cheating behaviors in schools, colleges, or universities include using a cheat sheet during a test or exam, copying homework or answers during a test or exam from a classmate, using a mobile device with Internet access during a test or exam, and plagiarizing homework. In science, plagiarizing scientific articles and manipulating results or datasets are all considered to be cheating behavior.

In a romantic relationship, cheating ranges from a one-night stand to an affair over a longer time period. In the industrial/organizational context, cheating can be considered with regard to embezzling money or virtually stealing money. When it comes to sports, cheating can be understood in the same way as in an industrial context, especially in the context of big sporting events, such as the Olympic Games. But it can also mean that a player is doped or a game is fixed (i.e., the players are paid to lose).

## Prevalence of and Reasons for Cheating

The prevalence of cheating depends on the context. Academic dishonesty frequently occurs. Studies report that over 75 percent of high-school and college students have cheated at least once. The data on the prevalence of infidelity in

committed relationships varies between studies, but one can conclude that infidelity occurs in less than one-quarter of committed relationships. In the organizational context, research indicates that every second job applicant is cheating. The prevalence of cheating within a sports context depends on the type of cheating behavior (e.g., game fixing or doping). For example, the rates for doping are nearly nonexistent or over 75 percent, depending on the type of drug (caffeine or anabolic steroids) as well as the sport (endurance sports, weight lifting, or gymnastics).

In general, people cheat to gain certain advantages. Those advantages can be either material or nonmaterial, and either direct or indirect. In an academic context, direct nonmaterial advantages of cheating can lead to good grades, higher authorization (to attend a certain college or university), and publications in scientific journals. An indirect nonmaterial advantage of academic cheating can lead to increases in honor (such as earning certificates) and reputation (e.g., increased listings in the curriculum vitae). These kinds of advantages can follow an indirect material advantage, such as a good job with high income. In a romantic relationship, a direct nonmaterial advantage of cheating can be pleasure. An indirect nonmaterial advantage of cheating in a romantic relationship—following an evolutionary approach—can be the maximization of the chances of gene survival. Cheating within the industrial/organizational context, as well as within the sports context, can lead to direct material advantages, such as monetary gains. Additionally, cheating in sports can also lead to the direct and indirect nonmaterial advantages of increased honor and reputation.

If a person who has been cheating is confronted with his or her behavior, a common reaction is to lie about the behavior in question in order to avoid punishment. However, in order to understand that cheating is immoral and socially undesirable, and that cheating can lead to punishment if discovered, a person needs to learn and develop a sense that cheating is not an accepted behavior. Avoiding punishment is one reason not to cheat, and is also the first stage of Lawrence Kohlberg's stages in moral development, which is a common way of thinking for all human beings. Even small children learn that avoiding punishment is an

indication that a certain behavior is not socially desired.

A tendency to assume that someone is cheating or not cheating creates a certain judgment bias. Assuming that someone is generally not cheating creates a so-called truth bias (a tendency to judge messages as truthful) and explains the veracity effect (truths are more accurately identified than lies). However, assuming that someone is a cheater creates a so-called lie bias (a tendency to judge messages as lies). The type of bias that a judge has depends again on the context. Whereas a truth bias can be found for teachers and romantic partners (and laypeople, such as students who are not experienced lie detectors), a lie bias can be found for police officers.

The truth bias can be explained by concern for certain errors: People who have a close, personal, and sometimes intimate relationship with the alleged cheater—such as teachers with their students and partners in romantic relationships—are more concerned with wrongly accusing the other. Wrongful accusation can be seen as a violation of relationship rules (e.g., trust) and can negatively affect the relationship quality. Thus, even if there is a suspicion of cheating, an accusation might be more harmful in regard to protecting the relationship than the actual cheating. This tendency to avoid the error of wrongful accusation leads to a truth bias. However, people who do not have a close and personal relationship, such as police officers and suspects, are more concerned with not catching a cheater. Thus, if there is a suspicion of cheating, not catching a cheater is more harmful than wrongfully accusing someone. This tendency to want to catch every cheater leads to a lie bias.

One of the most prominent areas of research on cheating is within the academic context. Generally, academic cheating is a serious problem concerning frequency and consequences of cheating. Academic integrity (attitudes, beliefs, and behavior that promotes a climate of integrity, for example, through honor codes) and moral standards are factors that reduce academic cheating. When it comes to the detection of lies about cheating in school, accuracy is at chance level, and thus detection is not different than accuracy of lies about cheating in other domains. Also in line with accuracy of detecting lies and truths

about cheating in other domains, the accuracy is higher for true compared to invented statements (veracity effect).

## Conclusion

The behaviors that characterize cheating can only be specified if the context is known. But the reason why people cheat is universal and independent of the context: Cheaters intend to gain advantages that they would not otherwise gain if they did not cheat. Also, the reason why people lie about their cheating behaviors is independent of the context: People want to avoid punishment for their immoral and socially undesirable behavior. When it comes to the detection of lying about cheating, people do not perform better than chance.

## Childhood, Lying in

Childhood is a challenging time when figuring out how the world works and what is or is not appropriate behavior are key goals. While relaying false or incorrect information is part of this general learning process, the more specific skill of lying in order to deceive is of particular interest to parents and educators alike. The paradox of lying for children exists in the hypocrisy of adults who say “lying is bad,” but they lie to each other and to their children. To confuse matters further, children learn from an early age that while they will be punished for telling a lie, they can also be punished for telling the truth.

Children navigate this conundrum over the course of childhood and adolescence, gaining perspective and insight as they move through the many developmental stages hypothesized to comprise the period from birth to young adulthood. Over time, they come to realize the importance of honesty, the stakes and consequences associated with lying, and that under certain circumstances, lying is not only acceptable but also necessary. In order to successfully navigate this learning curve, children must develop three vital skills:

perspective-taking, understanding the concept of intent to hurt, and the ability to communicate both truths and untruths.

### Lying in Early and Middle Childhood

Between the ages of 2 and 4, most children become verbal and enjoy the process of hearing and telling stories. They do not, however, have the ability to distinguish between reality and fantasy, often confusing the two. Added to this, children in this age group have short memories and often are unable to remember what they have done, even in the recent past. When this occurs, they are likely to try to retell the story of the events by guessing at what might have happened. A 3 year old, for example, may tell someone a very detailed story about her third birthday party, when in fact she is telling the other person what she hopes her fourth birthday party will include. She cannot remember what actually happened at the party, so she fills in the gaps with her desires for her future celebration, not understanding that the two are not interchangeable. At its most basic level, this story is a lie simply because it is untrue; however, for most adults it falls into the murky territory between lies, mistakes, and wishful thinking.

In this stage of development, children will sometimes tell outrageous and unbelievable lies, simply because they lack the ability to judge whether a statement is believable, or even to understand what the concept of believability is all about. This confusion is exacerbated by the fact that at this age parents often begin to teach their children about being polite, which in many societies actually involves telling lies. “I had a good time at your party,” or “I like visiting Auntie May’s house,” are lies that many children are encouraged to tell, despite the fact that they are simultaneously being told that lying is bad. Though imaginative, children in this age group are unable to take on the perspective of others, do not yet understand the concept of intent to harm through lying, and lack the communication skills to effectively lie.

As children age, however, they begin to gain further insight into the difference between lies and errors. Conscience, or the ability to recognize the difference between right and wrong and feel guilty when committing wrong actions, appears to emerge between ages 5 and 7. At this point

children learn that by lying, one has the possibility of avoiding negative consequences, guilt, and even punishment for one's wrongdoings. This understanding occurs before they develop the theory of mind necessary to understand why it works. At this stage, broken lamps are often blamed on siblings, imaginary friends, or freak earthquakes. Children in this age group are old enough to know that what they did was wrong, smart enough to know that there will be consequences attached to those wrong actions, and self-focused enough to try to deflect blame and punishment toward others, rather than tell the truth.

In addition to these self-serving lies, children in this age group also begin to recognize that lying can garner attention from other children and adults. Self-aggrandizing stories that cast the child as hero or adventurer begin to emerge, holding other children's rapt attention and inspiring admiration, acceptance, and sometimes even envy as the story unfolds. Not all of this attention is good, however. As the lie passes the point of believability, children and adults alike will

*As children age, they begin to gain insight into the difference between lies and errors. Between the ages of 5 and 7, a child's conscience emerges, and lying is used a way to avoid guilt and consequences. At that age, a broken lamp might be blamed on the cat, or a stolen cookie might be blamed on a sibling.*

lose interest and begin to doubt the veracity of the child's word. This need for attention can then backfire, cause the child to be excluded from his or her peer group, and garner disdain from the adults in his or her circle. These behaviors suggest that the 5- to 7-year-old child is developing his or her perspective-taking skills and improving in terms of communication; however, the child still lacks the understanding of how lies can be used to deliberately hurt others.

When middle childhood arrives between the ages of 8 and 10 years, children become better at considering another person's perspective and considerably improve their communication skills. In this age group, children still lie to avoid punishment, but they also start to lie in order to avoid having to do things that they do not want to do. For example, at this age children begin to complain of illness on test day or experience a turned ankle when it is time to take out the garbage. A new type of lie emerges at this stage, a lie designed not to hurt others or protect the self as much as to avoid disappointing or hurting others. Children between 8 and 10 years old are better able to understand the perspective of others and so can more effectively gauge when their wrongful actions or misbehaviors will be distressing to those they care about most. Because they are afraid of disappointing or hurting others, particularly their parents or other important adult figures, these children lie to cover up what they perceive to be their inadequacies or embarrassing actions.

For example, a 9 year old who has fallen while ice skating will not own up to a lack of skill on skates but will instead lie and insist that "I fell because John tripped me." This allows the child to save face and avoid seeing the look of disappointment from Mom and Dad, who the child believes will be embarrassed by his lack of athletic prowess. This shift in lying patterns suggests that while their ability to understand the power of lies to deliberately inflict pain on another person is still virtually untapped, children are aware that their actions can cause hurt or embarrassment to others and seek to avoid causing this disappointment by lying.

### **Preadolescent and Teen Lying**

As preadolescence begins, the scenario shifts again. Children ages 11 and up have had years to

hone their communication skills and are becoming much more effective at taking the perspective of others. At this point, their lies change from strict protection from consequences to more goal-oriented untruths. Preadolescents and adolescents begin to lie more to increase their autonomy from parents and other authority figures. Their ultimate goal with these lies is increased independence, ironic because often the price they pay for having their lies discovered is being grounded or having their actions and interactions restricted by these same authority figures. These young people, however, believe that the end goal is worth the risk and tell their parents that they are going to a movie with a friend when they are actually going to an unsupervised party where there will likely be alcohol.

This increase in autonomy goes hand-in-hand with lies told to resist or flout parental control. “The car ran out of gas,” for example, is a lie that is designed to allow a teen to break curfew while maintaining the possibility of truth. Even more important, preadolescents and teens are honing their lying skills, thereby becoming more convincing liars, and find their attempts at lying reinforced by getting away with the questionable behavior. The biggest difference with this age group, however, is the development of their understanding of the use of lies to inflict hurt on others. Often, these damaging lies are told to improve their standing with peer groups, maintaining their position as a member of an “in-group” by denigrating any “outsiders.” As research on bullying has found, this use of lies to hurt others as the foundation of malicious gossip can be just as or more damaging to the target of the lie as a physical attack.

### Parents’ Response to Children’s Lies

Children do not have an inborn ability to lie, let alone effectively lie. It is only after watching respected adults and older friends and siblings hone their deception skills that children develop the understanding of how to lie. Very young children are certainly capable of lying, but do not understand why it is not a particularly desirable trait. Not surprisingly, children learn prosocial lying early in life, and it remains the major type of lie that children (and likely adults) tell. Problems arise when people branch out from polite lies into

those that have the potential for negative consequences or deliberate infliction of harm. Whether parents want to believe it or not, children learn to lie from those around them.

As children grow, mature, and experience the world around them, they come to realize that everyone lies, even parents. It is therefore unrealistic to expect that a child will never lie. The question that is more important than whether or not a child lies is to ask why the child is lying. Age and understanding of falsehoods matters, but so does the reason behind the lie. Treating a lie as an opportunity to better understand a child’s inner and outer world, to see from his or her perspective how society functions, can be an invaluable tool in helping children navigate a world in which the truth is not always told.

To minimize the amount of lying in which children engage, parents and other adults must create an environment that minimizes the need for lies to be told and encourages the telling of even the toughest truths. This can begin very young and continue throughout the child’s lifespan, even into adulthood. By enacting a norm of reciprocity within the family, parents who respect their children enough to tell them age-appropriate truths, rather than easy lies, open the door to their children being more comfortable talking about the difficulties that they experience in day-to-day life. By avoiding setting a double standard, parents can teach their children how to be more honest, accountable, and responsible as they move toward adulthood.

## Children, Development of Deception in

Academic investigations of children's ability deceive and lie dates back to the late 1800s and early 1900s, with scholars such as Charles Darwin and Jean Piaget noting instances of lying in children as young as 2.5 years old. Research in the last 20 years indicates that although a child as young as 3 years of age may be able to recognize deceitful behaviors, the ability to use lying and deception strategically emerges more clearly at ages 4 and 5. Development continues throughout childhood and adolescence, as does the ability to differentiate prosocial from antisocial lying. These developments are typically tied to children's moral development, theory of mind, and executive functioning. In addition, recent research indicates that lying is both culturally and developmentally universal.

Although there are varying definitions of deception and lying in the literature on children's development of these skills, deception is generally held to be the intentional communication of something known to be untrue in the attempt to deceive another person and induce a false belief. These deceptions can be verbal or nonverbal, and can include role-playing and magic tricks and omission of relevant information. Lying is typically defined more narrowly as the use of knowingly false statements or assertions. Thus, lies are by default deception, but not all deception is lying.

Children are taught that deception is a moral issue: Lying is bad and honesty is a virtue. Society is replete with narratives and parables to support the virtue of veracity, from the story of George Washington and the cherry tree to Peter and the Wolf. Honest people are seen as heroes and role models, whereas chronic liars are seen as untrustworthy. Research indicates that lying reduces credibility and damages personal and social relationships. Chronic liars are also seen as developmentally delayed and socially maladjusted.

### First Lies

Children's first lies are typically told to avoid consequences for misdeeds, thus to protect themselves or to injure another person (get someone in trouble). These lies are antisocial lies, which are self-interested acts that put the needs of self above

the needs of others. Self-protective lies are among the most common lies in early childhood, and they emerge the earliest, some studies suggesting as young as 2.5 years of age.

Studies frequently investigate these issues through an experimental procedure called the temptation resistance paradigm: Children are invited into a lab and told not to look at an enticing toy or other object while the researcher leaves the room. When the researcher returns (and has been watching the child), the child will be asked if he or she peeked at the forbidden object. Though over 80 percent of the children at all age groups peek, fewer younger children lie (approximately 30 to 40 percent of 3 year olds) than older children (majority by age 7). Scholars suggest that as children develop, they are more concerned about the consequences of misdeeds, thus they are more likely to conceal them. Thus, fearful of punishment for disobeying, older children believe that they can lie to avoid consequences.

### Prosocial and Antisocial Lies

Children are more likely to engage in antisocial lies for self-gain as they age. In one study, 87 percent of 5 year olds lied about the location of a prize to keep it to themselves, whereas only 29 percent of 3 year olds did. Moreover, when trained to mislead an investigator about the location of the prize, most children were able to do so by age 4. In addition, as children age, their spontaneous antisocial lies become harder to detect: By age 8, it becomes difficult for adults to discern which children lied and which children were truthful. Thus, older children lie more frequently and are better liars than younger children.

Conversely, children learn that some lies are not only acceptable, but are also desirable and the morally right thing to do. For instance, white lies that protect the face of others are seen as polite. Socially skilled children learn that honesty can also be seen as rudeness when it can hurt the feelings of others. Moreover, deception can be playful, such as the early games of peek-a-boo, in which an adult tends to disappear when only hidden behind a cloth, and games such as "Got your nose," in which adults will place their thumb between their index and middle finger and pretend that it is the child's nose removed from his or her face.

Children's ability to distinguish their moral evaluations of antisocial and prosocial lies changes with age. Studies show that young children assert that all lies are bad, yet they rate prosocial lies less negatively than antisocial lies. However, by late elementary school, although antisocial lies are evaluated as negative, prosocial lies are deemed positive. In middle childhood and into adolescence, research indicates that this pattern holds. It has been suggested that this change is not only related to moral development, but may also reflect children's linguistic flexibility.

Utilitarian thinkers note that in order for children to understand when and how lying and deception are appropriate, they must learn to differentiate socially inappropriate from socially appropriate uses of deceptive behavior. Studies indicate that adolescents develop a more sophisticated and nuanced understanding (e.g., not classifying prosocial misleading statements as lies) of deception than younger children. Children become increasingly concerned about the needs of others and will use deceit and lies to protect their relationships with others.

In laboratory studies, researchers found that when given a disappointing gift (a bar of soap), both older and younger children were likely to feign appreciation for the soap, though it was more common in older children (84 percent of 9 to 11 year olds, versus 72 percent of children ages 3 to 5). Most evidence indicates that the rate of lying also increases from early childhood, with decreases from middle childhood through adolescence.

### **Theory of Mind and Executive Functioning**

Aside from morality, another explanation for the development of lying is tied to theory of mind. Theory of mind is a person's ability to accurately understand and predict the beliefs and expectations of others whose knowledge and information may be different from one's own. A classic test of theory of mind involves presenting children with a false-belief task in which the child is privy to information that characters in a story would not be; the child then has to determine what one of the characters in the story would think. Thus, this test requires a child to separate his or her beliefs from another person's understanding.

Theory of mind scholars point out that although very young children may lie, studies indicate that they have more difficulty maintaining the lie, which involves not only understanding that they can utter something untruthful and that the other person may be fooled (first-level planning), but also consistently executing the lie, which requires them to think not only about the lie told, but also about how another person might reason about the initial false belief. Thus, metareasoning, or an understanding of recursive beliefs, is necessary for advanced or second-level strategic lying.

In addition to theory-of-mind development, it is only with age that children learn how to present their lies in ways that make their deception believable. Specifically, in the later elementary school years, children are routinely able to craft lies that are convincing to adults, which include being consistent in dishonest utterance and controlling both verbal and nonverbal leakage cues. At approximately 8 years of age, the variety of skills necessary to lie convincingly begin to converge.

There are differences in skill levels even among same-age children. Children with more advanced executive functioning skills are better able to mask their lies than children with weaker skills. Because the success of a lie is predicated on whether the lie is worth telling and whether a deception can be maintained, the executive functioning skills in areas such as planning behaviors and cognitive flexibility have also been related to success in lying.

Moreover, sophisticated, strategic lies take planning and behavior execution. Children with stronger working memory capacity are better able to conceal their lies and can better differentiate helpful from harmful information. Therefore, more skilled children are better able to facilitate the variety of necessary processes than lesser skilled children.

The development of lying as a skill is also associated with several positive outcomes. Several studies have tied the ability to lie with interaction in socially appropriate ways. The skills necessary to detect deception in others, such as decoding nonverbal cues and perspective-taking, are also precursors to competent interactions. Recent research suggests that children with better lying skills are also more likely to be successful in later life.

### Cross-Cultural Consistency

The research on deception in children has been conducted in several different countries and continents, including the United States, Canada, Africa, China, and Japan, and the results have been relatively cross-culturally consistent. Thus, it appears logical to assert that children's use of lying operates similarly in different cultures, operating both for self-preservation (antisocial lying) and relational preservation (prosocial lying). Furthermore, the developmental factors underlying children's ability to deceive and lie also appear consistent.

Some cultural factors affect the specific types of lies that are acceptable. For example, Chinese children rated self-effacing lies (modesty) and lies that benefit the collective good more positively than Western children in more individualistic cultures. Although some factors, such as the differences in collectivist versus individualist cultures, may affect the timing of lies or the context necessitating lies, the overall process and skill set appears to be the same.

### Conclusion

The increasing development of moral and cognitive skills enables children to become more adept in determining not only when lies are appropriate, but also whether or not they will be successful in maintaining deception. Children who deceive others too frequently or who tell antisocial lies more than their peers are deemed chronic liars and may, in the extreme, be identified as having signs of maladjustment or even at risk for psychopathology.

Deception is ubiquitous and serves both positive and negative ends. Children learn to lie to protect themselves and their relationships with others, and although they are taught that lying is morally wrong, they are also taught that it is right to mask certain thoughts and emotions that may bring harm or discontent to another person. Several developmental skills and abilities are necessary for children to navigate this often difficult terrain.

## Children's Sports Teams

Professional sports are a multibillion-dollar, worldwide industry. Club sports and intercollegiate sporting teams, once a bastion of amateur competition, are today fraught with scandals of all kinds. The emphasis on competition from those higher levels has filtered down to youth athletic leagues, and in the interest of winning, young participants, overzealous parents, and their coaches have increasingly used deceptive practices to gain advantages that are not permitted by established rules and regulations.

Deception has been documented in cases in which a youth's eligibility to participate would

otherwise be invalidated during game play in order for players and teams to gain an unfair advantage over their opponents, and in efforts to further criminal activity that is tangentially connected to the athletic competition. Similar to other fields of human endeavor, deception in children's sports can involve intentional fabrications and omissions. Likewise, cheating and deception in children's sports are not bound by gender.

Deceptive practices have been used to make children eligible to participate in sports leagues in which they normally would be disallowed. For example, age limitations are commonly enforced in certain levels to maintain competitive balance between athletes and teams, but the ages of children have been falsified in certain instances to produce an unfair competitive advantage. This type of deception is typified by the case of Danny Almonte, who competed for a Little League baseball team from the Bronx, New York, in the 2001 Little League World Series. Playing under a falsified birth certificate, Almonte was actually two years older than the Little League age limitation of 12 years. Following a game against Apopka, Florida, in which Almonte pitched a perfect game (i.e., no opposing player successfully reached base) against his younger opponents, investigators uncovered the false document, and ultimately had Almonte's team disqualified from play and its victories vacated. The incident also motivated Little League officials to modify their existing eligibility policy, to require multiple documents and proofs of residency for player eligibility.

Age falsification is not solely the province of youth sports in the United States. In 2012, the chief of the naval staff in Nigeria testified to the rampant age falsification occurring in the under-14 and under-17 soccer programs in his country. Deception has not only been employed to validate overage athletes, but also to validate underage youth. Dong Fangxiao, a member of the Chinese women's gymnastics team competing in the 2000 Olympic Games in Sydney, came under suspicion of being less than 16 years old, the minimum age to compete in this sport. An investigation by the International Gymnastics Federation concluded that her true age of 14 had been falsified in order to comply with the rule, and as a result, the team was forced to forfeit its bronze medals.

### **Game Play Deceptions and Confidence Scams**

At times, deception has also been a part of actual game play. Many youth leagues have instituted rules intended to protect youth from overuse injuries by setting limits on their participation, which requires coaches to monitor players' participation and prevent them from surpassing the limit, taking a player out of an ongoing game if necessary. However, numerous coaches have been observed in violation of such rules by, for example, purposely under-reporting the number of innings that an athlete has pitched in the past week in a baseball game, with the intent of keeping a star player on the field.

Deception has not always been performed with the goal of winning in mind. In the summer of 2012, the coaching staffs of two youth baseball teams participating in the Encinitas (California) National Little League (ENLL) were suspended from coaching for the rest of the season following a game in which one team was suspected of deliberately "throwing" the contest. Because of a point-differential formula used to qualify for the league's postseason tournament, the players on the ENLL Threshers were allegedly instructed to intentionally lose to the opposing Redwings, which would allow the Threshers to qualify for the league semifinals. Because the coaches were not found guilty of collusion, the outcome of the game stood, despite their suspensions.

Deceptive practices influencing game play can also be collaborative. In 2012, coaches of youth football teams in south Florida were charged with operating a massive gambling ring involving the teams in their charge. The 18-month investigation, known as Operation Dirty Play conducted by Broward County Sheriff's Department, resulted in the arrests of nine men, some of whom were previously convicted felons. Players as young as 7 years old were allegedly paid for their performances, and at times, were bribed during attempts to sway game outcomes. Betting on the league championship game alone was described as involving over \$100,000.

Finally, youth sporting teams have been used to make inroads toward unsuspecting targets of confidence scams. A notable example involved the founder and coach of the Houston (Texas) Select Amateur Athletic Union (AAU) boys' basketball team, David Salinas, who came under

investigation by the U.S. Securities and Exchange Commission in 2011. According to investigators, Salinas used his position as a coach of highly touted prospects to make personal connections with collegiate and professional basketball coaches and players, with the intention of inviting them to invest in his financial group. The bonds that were offered to investors did not exist, and the identification codes used to verify the bonds were fabricated. Salinas ultimately embezzled close to \$47 million through the fake portfolio, including \$8 million from some 13 college basketball coaches alone.

Though many believe that an emphasis on winning at all costs has become more pervasive in recent years, public parks and recreation programs in municipalities across the United States have also increased their efforts to establish educational programs, policies, and a culture that reinforces principles of fair play. Youth are particularly at risk because of their age and stature relative to parents and coaches encouraging their duplicity. However, the use of deception, or the lack thereof, ultimately lies within the individual. The decision to use deception in sports was perhaps best illustrated by former Major League Baseball player Mark Grace, who once stated, “If you’re not cheating, you’re not trying.”

## Churchill, Winston

Winston Churchill was the son of Lord Randolph Churchill of Great Britain and Lady Jenny Jerome. As a soldier, member of Parliament, and the prime minister of Britain, Churchill was well known for his honest character and raw wit. However, many of Churchill’s most significant actions were the result of strategic deception through innovative military intelligence. Inspired by the deceptive ploys of his 18th-century ancestor Lord John Marlborough, Churchill believed that cleverness was essential in the art of war.

In the backdrop to his political career, Churchill gained nationwide acclaim for deception in the Second Boer War (1899–1902). A young war correspondent in 1899, he explored conflict between Britain and Dutch settlers over the Boer region in South Africa. While traveling by train to report on the detainment of British settlers in prison camps, he was ambushed by Boer soldiers and held captive. Coming from a royal family, he was a high-profile prisoner, held under constant surveillance. However, in quick response to his guard’s relaxed watch, Churchill jumped the fence and fled. Luckily, he found refuge with a local businessman who was sympathetic to the British. The businessman hid him until he could travel to safety. Returning home after one month in Boer detainment, Churchill gained national recognition for his daring escape.

### Strategy of Deception

As prime minister during World War II, Churchill’s deception was pivotal to the Allied victory. His strategy of deception began with his creation of the London Controlling Section (LCS), a secret intelligence office devoted to generating military stratagems. LCS members were not trained in military science, but took a historical approach in their research of deception. They were experts on Adolf Hitler’s strengths and weaknesses and patterns of operation within the Third Reich. Churchill fueled the daily operation of LCS with Ultra, a breakthrough program that gave the British access to Enigma, the main communication line between Hitler and the German military.

This secret operation developed by chance when former Enigma expert Richard Lewinsky was kicked out of Germany because he was

*The Big Three meet at a palace in Yalta, Ukraine, February 1945. Seated from left: British Prime Minister Winston Churchill, U.S. President Franklin D. Roosevelt, and Marshal of the Soviet Union Joseph Stalin. Churchill, whose wartime deceptive strategies were crucial to the Allies, once said, "In wartime, truth is so precious that she should always be attended by a bodyguard of lies."*

Jewish. Out of spite, Lewinsky approached the British, sharing his skill and insight into the design of Enigma and the code used to encrypt the information. After heavy evaluation by British intelligence officers, Lewinsky created a system that allowed the British to intercept and decrypt German messages with speed and precision. Ultra became an invaluable resource to Churchill and selective chiefs of staff in bargaining with the Allies, persuading neutral actors including the United States, and in deceiving the Allies' enemies during World War II.

With a daily inflow of German correspondence, Churchill was protective of Ultra. He appointed himself the minister of defense and took discretion over the collected intelligence. Churchill

initially realized the value of Ultra during the Battle of Britain, when Hitler attempted to overtake Britain so that it would not be used as a base of operations against him later in the war. Ultra gave Churchill direct information regarding Hitler's plan of attack. Churchill was able to preemptively place extra reinforcements in target areas, deceiving Germany without its knowledge of a breach. This insight gave Churchill an advantage and helped attain Britain's victory.

However, in November 1940, Churchill's protection of Ultra was tested when it revealed Hitler's plan to attack the city of Coventry. This information came at least two days in advance of the attack and, despite heated deliberations to intercept, Churchill commanded that no action be

taken. He could not risk Germany investigating the reinforcement and finding the breach. When information regarding Ultra became available to the public three decades later, many argued that Churchill deliberately deceived British citizens by sacrificing them for the protection of Ultra. However, others contended that Churchill believed that Coventry's military protection was sufficient to respond to the German attack.

Ultra was not limited to German communications but was also able to decrypt Italian and Japanese correspondence. Although neutral prior to Japan's attack on Pearl Harbor, the United States often cooperated with Churchill regarding intelligence information against communist forces. Britain needed military aid and strategically disclosed certain information to President Franklin D. Roosevelt in return for supplies. As these exchanges progressed, Churchill increased the amount of information privy to American interests, and Roosevelt realized the value of this relationship. These interactions led to an alliance between British and American intelligence operations. This American step away from neutrality was among many controversial subjects surrounding the relationship between Churchill and Roosevelt. While no evidence was found to show deception of neutral objections, antiwar sentiments held that Churchill persuaded the United States to become embroiled in the conflict. This controversy includes earlier private correspondence between Roosevelt and Churchill during the latter's service as the lord of Admiralty.

Allied forces gained the greatest advantage over the Axis powers by joining their intelligence agencies in a grand plan of deception named Operation Bodyguard. This name was in response to Churchill's clever rhetoric insisting that "in wartime, truth is so precious that it should always be attended by a bodyguard of lies." Churchill knew that British and American intelligence could not carry out this campaign without Russian support. On March 3, 1942, delegates representing Russia, the United States, and Britain met to sign a contract of intelligence cooperation. This contract led to the grand alliance of the Big Three. Their overarching plan against Hitler included dozens of secondary projects in which Churchill, the LCS, and Ultra were tasked with operational responsibility.

Under Operation Bodyguard were Operation Overlord and Operation Fortitude. Overlord sought to deliberately confuse Hitler regarding the location and date of the attack, delaying his ability to send reinforcements. Fortitude's goal was to convince Hitler of the need to thinly spread his forces throughout Europe while, in reality, diluting German strength against attack. Within these projects, Churchill's British intelligence service created the Double-Cross Committee. This group enlisted German agents to relay strategically formulated information between Britain and Germany. These double agents deliberately deceived Hitler into believing the ploys within Operation Bodyguard. Ultra provided confirmation that Hitler was falling for the illusion. On June 6, 1944, the Allies successfully invaded German-occupied Europe. Hitler believed that Normandy was the real diversion, and failed to provide reinforcements in time to counter the attack. This was a pivotal turning point for the Allies' victory.

From his clever days of reporting to his intentional direction of the LCS and Ultra, Winston Churchill was a strategist. He understood the boundaries of power, the necessity of deception against Germany, and the value of intelligence information in forming alliances. However, despite the secrets and controversies, Churchill created a legacy of determination. He proved that deception of the right kind is greater than injustice.

## Civil War, U.S.

During the U.S. Civil War (1861–65), both the Union and Confederacy employed deceptive practices in hopes of defeating the enemy and winning the war. Efforts at deception included civilian spies, military intelligence, sabotage, and agreements for foreign support. Ultimately, the Union's efforts were more successful, largely because of superior manpower and a stronger communication network.

When the war started on April 11, 1861, neither side had an established system for military intelligence. In fact, the U.S. Army did not have an official organization for intelligence. The accepted practice was for commanders to handle intelligence, or delegate it to their provost marshal. Manuals existed on related topics but not on the specialty of military intelligence. Some soldiers with Mexican War service offered some expertise in the area of intelligence, but they also served as commanders during the Civil War. Some of these men opted to serve in the Confederate Army, so they took their connections with them when they left the Union forces.

### Confederate Actions

Initially, the Confederacy heavily borrowed from the federal regulations and practices they knew. One practice was to subscribe to Union newspapers under a false identity, and these newspapers provided a great deal of information in the early months of the war. Newspapers initially carried information about troop movements and other rumors. Soon, the combination of martial law in some areas and the realization that most of the information was not only dated, but untrue, led to a change of tactics.

The Confederacy established the Signal Bureau in 1862 to handle military intelligence. Prior to its establishment, the Confederacy relied on information provided by people such as Lt. Col. Thomas Jordan and others who were stationed in Washington, D.C., before the war. Jordan served as the assistant adjutant general for Gen. P. G. T. Beauregard after the war began. Prior to his departure to join the Confederacy, Jordan established a network of informants in Washington, D.C., who helped the Confederates win the First Battle of Bull Run.

The Confederacy created a series of agencies under the umbrella of the Secret Service. Special missions and their respective agents reported to Judah Benjamin under the State Department of Secret Service. The War Department worked with field commanders and the Signal Bureau to get information to commands and to Washington, D.C., and Richmond, Virginia. The War Department Torpedo Bureau and Navy Submarine Battery Service oversaw the planting of land mines and underwater mines in rivers and harbors. The Greenhow Group was an espionage organization based out of Washington, D.C., which supported the Army of Northern Virginia throughout the war, despite the arrest of some of its operatives, such as the spy Rose Greenhow. Gen. J. E. B. Stuart recruited and trained a group of cavalry scouts to keep him informed about enemy movements. These scouts also reported to Gen. Robert E. Lee, who relied upon their information until Stuart's death impacted their effectiveness. A final group under the Secret Service was the operatives who worked in Canada during the latter part of the war. While not an official organization, these agencies did a great deal to contribute to the early success of the Confederacy.

The Confederacy actively used soldiers as messengers in order to deceive the Union armies. Three times during the war, Union forces were tricked by messengers sent by the Confederates who bore orders while wearing Confederate uniforms. Contributing factors to the success of this deception were the common language spoken by both sides and a lack of curiosity by the Union officers, who did not question the messengers about their clothes or their accents. In most cases, the commander would see through the deceit. One instance proved that Union Gen. Ulysses S. Grant could not be taken in by false information. A Confederate deserter with the rank of second lieutenant provided information about a future battle that swayed Secretary of State Edwin M. Stanton to call for a change in plans. When approached about the change, Grant knew that something was amiss because officers at the lower ranks are not privy to the level of information that the deserter claimed to know.

Confederate generals effectively used deception against the Union in a number of instances during the Civil War. In many situations, the Union forces

and supplies outweighed the resources available to the Confederates. A common deception used by the south was the Quaker gun, a fake artillery piece made from a barrel mounted on a carriage and painted to look like a cannon. From a distance, the deception was convincing, and often the enemy would wait days before approaching the battery.

Gen. John B. Magruder faced a force of Union troops five times the size of his force in Yorktown, Virginia, in April 1862 by using the same troops along the same line of defense. The soldiers would move from one position to another, and troops in the area would create sound effects, including cheers and other sounds typical of a garrison. Union Gen. Erasmus Keyes believed the ruse and postponed the attack. Gen. George B. McClellan, the Union commander, also opted not to attack but rather to use a siege tactic to take Yorktown. Magruder and his forces were able to escape before the siege took place.

Beauregard used a similar ploy to escape from Corinth, Mississippi, in May 1862. Faced with enemy forces commanded by Gen. Henry Halleck and Gen. John Pope, it was necessary to withdraw Confederate forces in order to save these troops for another battle. Through the night, Union scouts heard the constant cheering of soldiers, marching music, and trains arriving at the station and unloading reinforcements. In truth, Beauregard ordered his troops to run the train back and forth on the track, and for the troops to cheer each time it arrived. Artillery soldiers manned their guns near the campfires as ordered by their commander. In an act of deception, Beauregard sent some of his soldiers disguised as deserters to enter the Union camp in order to give the soldiers false counts about the number of reinforcements. Instead of reinforcements arriving, however, the Confederates actually withdrew their troops from Corinth, and upon arrival, Union forces found stuffed dummies manning the Quaker guns along the line.

The best deceptions along the Confederate line came from Commanding General Robert E. Lee. In May 1862, Lee's Army of Northern Virginia was in Virginia near troops commanded by Union Generals Nathaniel P. Banks and Irvin McDowell during the Peninsula Campaign. Banks was ordered to link up with McDowell

and McClellan near Fredericksburg, and Lee sought to prevent the merger of the two Union armies. Secretary of War Edwin M. Stanton, Secretary of State William Seward, and President Abraham Lincoln learned that Lee ordered Gen. Thomas "Stonewall" Jackson to attack Banks's force, which caused great concern about the safety of Washington, D.C. As a result, Banks did not receive reinforcements, and because of the threat in the Shenandoah Valley some of his forces were moved. Lee was able to get the Union forces away from Richmond and McClellan. Jackson moved his forces to avoid the attempt by McDowell Banks and Maj. Gen. John C. Frémont to catch him in a pincer movement, and was able to defeat McClellan in a combined attack with Lee, thus turning the victory in the Peninsula Campaign toward the Confederates.

Aside from actions taken in battle, the Confederates had limited success in other attempts to deceive the Union. Because the Confederates needed to establish diplomatic relations for their new country, men were sent to Canada and countries in Europe to establish relations and gain support for the new government. While attempts were made to discredit the Union and sway support to the Confederacy, little was accomplished because Union diplomatic officers were in contact with the same officials.

Confederate deserters and prisoners of war often tricked Union soldiers with false information about troop locations and intentions. Deserters and others associated with the war effort but not serving in the military often tried to disrupt transportation and communications. Southerners would capture supply trains, destroy rail lines, and raid the farms of those who refused to side with the Confederacy. In Missouri, a border state that remained in the Union despite having a declared Confederate government, warehouses were damaged by attempted arson and river barges were set on fire. Southern sympathizers also attempted to set fires in New York, freed prisoners of war, and even tried to establish a new confederacy in the northwestern United States, a mission that failed.

### Union Deceptions

Deceptive actions did not occur solely in the Confederate government; the Union side also made some successful attempts. Early in the

war, the north learned to rely on the news in the southern papers for some of its information about troop movements. Unlike the northern press, which had some publishing restrictions, southern newspapers had no blackout on news. The southern sense of independence would not tolerate being restricted, and not until late in the war was it necessary to limit news coming out of Richmond.

Deceptive practices were used early on in the war in the contested state of Missouri. Pro-Union citizens and soldiers such as Frank Blair suspected that the National Guard camp in north Saint Louis was actually a Confederate training ground operating under the guise of the National Guard. Blair rode through the camp in his mother-in-law's carriage disguised as a female. He observed that the street names were changed to the names of Confederate generals, and with information from his sources, he surmised that the governor of Missouri, Claiborne Jackson, was planning to use National Guard troops to attack the federal arsenal. Blair was prepared when the guard troops attempted to attack the arsenal, thus keeping Missouri in the Union.

In 1862, Confederate forces were winning on the first day of the Battle of Shiloh. That night, Gen. Don Carlos Buell's Army of Ohio arrived to reinforce the Army of Tennessee commanded by Gen. Grant. Confederate scouts thought that the troops were fellow southerners until the band struck up a tune that was a northern song; they realized that Grant's reinforcements had arrived. Once this discovery was made the scouts attempted to notify Beauregard about the Union counterattack, but were unsuccessful. As a result, Confederate Gen. Nathan Bedford Forrest had no choice but to retreat.

Union generals had similar success deceiving the Confederates during 1863. Grant successfully laid siege to Vicksburg, Mississippi, from the south by using small skirmishes in the area to distract the Confederates. Grant was able to march his forces undetected down the opposite bank of the Mississippi River and across the river south of Vicksburg at Bruinsburg. Grant attacked from the south, and eventually Vicksburg surrendered in early July 1863. In a similar feint, Gen. William Rosecrans sought to cross the Tennessee River to capture Chattanooga in August 1863

without detection by Confederate Gen. Braxton Bragg. Rosecrans sent part of his army east and then north to attempt to cross the river while the rest of the force was coming from the south. Bragg planned on an attack from the north and waited too long to reinforce his southern flank, enabling Rosecrans to cross the Tennessee River into Chattanooga, and forcing Bragg to surrender the railhead.

Lee's supply line between Fredericksburg and Richmond came under attack by Union Gen. George Stoneman following orders issued by Gen. Joe Hooker. Lee's forces intercepted a false message created by Hooker's chief of staff, Gen. Daniel Butterfield, who knew that the Confederates had figured out the cipher code used among the Union armies. He decided to send a message indicating an attack on troops led by Confederate Gen. Fitzhugh Lee's troops. Once the message was intercepted, it was sent on to Lee, who moved his forces in preparation for an attack in the Shenandoah Valley led by Stoneman. However, the attack never came. Instead, Lee was tricked into creating a gap in his defensive line that resulted in the Battle of Chancellorsville. However, the Army of Northern Virginia survived because Lee sent General Thomas "Stonewall" Jackson around Hooker's line and forced Hooker to retreat.

Union Adm. David Porter managed a successful ruse and escape in the battle of Vicksburg. Porter's ironclad river gunboat, USS *Indianola*, was attacked and run aground in the Mississippi River. Porter escaped onto a barge, and had his men convert the barge to look like an ironclad. In hope of drawing fire away from Union forces, the sailors drifted downriver near Vicksburg, where the batteries fired on them. As they approached the wreck of the *Indianola*, the Confederates who tried to salvage it found themselves without protection from the Confederate ships. Faced with a Union ironclad and no protection, the men opted to blow up the *Indianola*. Thus, Porter prevented the Confederates from adding his ship to their fleet and learning the secrets of how to construct Union ironclads.

As the tide of war began to turn toward the Union, the Confederacy in 1864 increased its attention toward trying to influence a peace movement. Northern voters needed to be influenced, and the Confederates hoped to accomplish

this goal through covert operations. Southern operatives would conduct acts of sabotage in northern cities, as well as use forms of irregular warfare among Union troops. Confederate plans included an attempt to disrupt the Union command as Robert E. Lee retreated from Richmond, and an attempt to blow up the White House in mid-April 1865.

Neither plan took place, but Confederate records indicate that money was distributed to John Singleton Mosby and Thomas F. Harney to accomplish these tasks and other raids. Mosby's Rangers were to disrupt supply lines, capture Union soldiers, and prove elusive to the Union. Even after the surrender at Appomattox, Mosby did not surrender but rather disbanded his unit 12 days later, on April 21. His activities in the war made him a wanted man, but after his capture in Lynchburg, Virginia, in June 1865, he was reprieved by Grant and sent home.

### Intelligence After the War

By war's end, neither the Union nor the Confederates had a superior organization for military intelligence. The practice of deception in battle and military strategy was in its infancy. Both sides relied on civilian spies who were all too easily captured. As the war dragged on, the Union became more familiar with Confederate activities and more effective at disrupting them. Attempts by the Confederates to get the British and Canadians to help their cause in secret, using agents sent to Canada, resulted in failure.

Both sides had scouts responsible for keeping track of the locations of armies and troop counts. It was important to keep the high commands informed about the number of regiments, artillery, and status of supply. For the north, this information indicated the effectiveness of its blockade and the prevention of runners making it through successfully. For the south, the location of armies and supply lines helped determine where it could acquire material to supplement its ill-equipped forces. News about the location of armies also contributed to the rate of desertion in the south, as the morale of the troops declined.

The use of lies and deception during the U.S. Civil War was unique because it was a war fought by fellow countrymen. This posed greater

challenges because persons fighting for the Confederacy and serving as its leaders had ties and connections with persons in the north, especially in Washington, D.C. Rose Greenhow was a successful spy in the early part of the war because of her connections. She had southern sympathies but was able to act the part of a northerner. Other spies were not as successful and failed on their first missions.

The press in both the north and south gave away a great deal of information about troop movements, both true and false. Union officials were able to control the press, but southerners would not condone having their freedoms limited. The invention of the telegraph in the years prior to the war increased the ability to disseminate information. An enemy spy could decode the information sent by wire and pass it on to interested parties. The commonality of the English language allowed some people to pass themselves off as trustworthy messengers, if the commander did not pick up on the speech and dialect differences.

## Clausewitz, Carl von

Carl von Clausewitz lived during a time of considerable unrest in Europe. Born in 1780, just after the French Revolution, he joined the Prussian military at age 12 and served in campaigns during which the Prussians invaded France and Napoleon Bonaparte invaded Prussia. He was a prisoner of war in France from 1807 to 1808. He also served in the Russian military from 1812 to 1813 during the Russian campaign against Napoleon. He returned to the Prussian army in 1815 and served in battles as part of the larger Waterloo campaign in which Napoleon was defeated.

Clausewitz was made a major general in 1818. In 1830, revolutions broke out in several places in Europe, and he was appointed chief of staff to the Prussian army on the Polish border. He died in 1831 from cholera. His famous book *On War* was unfinished when he died, but was compiled into its published format by his wife.

### *On War*

*On War* is the first robust philosophical treatise to study war. It continues to maintain significant influence, sometimes more so outside the West than in the West. It was a favorite of Vladimir Lenin's and was relied upon by Mao Zedong. Clausewitz is known to have studied philosopher Immanuel Kant, and to perhaps have known philosopher Georg Wilhelm Friedrich Hegel, but there is no agreed upon philosophical influence in his study.

Clausewitz is best known for defining war as the continuation of politics by other means. He also maintains that war is the use of force on another to realize one's will. As such, there is a subordination of goals in war. There is the immediate goal of causing harm or destroying others property, but this is nested within the larger political goal that might have nothing to do with the military goal.

Clausewitz is sometimes cited as maintaining that in war, there are no laws. However, this is a misunderstanding of a more general point that he was making about the nature of war. Once a nation is committed to the use of war as a means to a political end, he argues, the rules governing this kind of behavior are not the same as those governing political actions independent of war. If a nation refuses to commit specific kinds of

actions during war, then this becomes a source of weakness for that nation and a possible strength or advantage for the other side. The nation with such restrictions has placed a limit on its political goal by indicating in essence where it will stop in pursuit of this goal.

In a similar way, Clausewitz argues that the more powerful the motives for a war, the more this war will affect all aspects of the existence of the nations involved. The more powerful the motives, the more each nation will be given to the final destruction of its enemy. The limits in war are therefore relative to these initial motives for the war, and these in turn place restraint on the extent to which a nation will act to achieve its goal.

Clausewitz had been in real military campaigns, and he brought his knowledge to his theory by noting that each individual case of war is unique. He famously said, "War is, therefore, not only a veritable chameleon, because in each concrete case it changes somewhat its character, but it is also, when regarded as a whole, in relation to the tendencies predominating in it, a strange trinity." This trinity is composed of the original violence in the essence of war, the hate and enmity that introduce a kind of probability and chance and make war a free activity of the emotions, and its subordinate character as a political tool that makes it a matter of pure intelligence.

It is in this area of interaction between the known and the unknown that Clausewitz applies his theory to actual human conditions. He argued that while persons strive toward clarity and certainty, there is something strong in chance that often greatly influences human choice. Therefore, he said, the more self-confidence and courage, the more chance is permitted. Nevertheless, this applies to theory in that such aspects of the human condition can be factored into a commander's considerations.

War is not merely the release of energy in a random manner not guided by rules. Instead, Clausewitz observes the following:

War in the real world, as we have seen . . . is the operation of forces which do not in every case develop in exactly the same way and the same proportion but which at one moment rise to a pitch sufficient to overcome the

resistance which inertia and friction oppose them, while at another, they are too weak to produce any affect.

So while war lasts, it is the exertion of force toward a goal, and the interaction of forces no matter what the outcome affects that goal, thus war is always guided by intelligence.

The subjective, and therefore the possibility of deceit, enters into war in the area of the known and unknown. The commander must act on what is known while taking into account all that remains unknown to influence the outcome of efforts. Clausewitz does not recommend the use of deceit in war because it is an attempt to influence what is unknown for the enemy, but with unknown results for one's side. Where these unknowns can be eliminated, deceit might play some purpose.

Finally, what is attractive about his theory is that Clausewitz subordinates war to the idea of a larger goal. Insofar as the highest goal can be identified, a person or nation is able to determine which side in a conflict should be chosen and the extent to which war can help attain the highest goal. War is therefore not simply the violence of one will against another, both equally arbitrary, but a conflict of wills in pursuit of competing goals. All sides in a conflict might be mistaken about what is actually the highest goal, but it also presents the case that some side has identified what is truly the highest goal.

## Clever Hans

In 1904, a school teacher in Germany by the name of Wilhelm von Osten announced to the world that his horse, Hans, had remarkable talents. Hans appeared in newspapers and magazines and on postcard and liquor bottles, and his exploits were even sung about on the stages of Europe. Von Osten had previously served as an instructor of mathematics at a German gymnasium, and he was an enthusiastic horseman and hunter. He had apparently trained his horse to answer arithmetic questions such as multiplication, subtraction, and division.

Hans would answer questions by tapping his hoof on the ground, indicating the correct answer. For example, if the question was "What is three plus seven?" Hans would tap his hoof 10 times. When the answer to a question involved a small number, Hans would tap slowly with his right foot. When larger numbers were part of the answer, he would respond by tapping faster from the start of his answer. Initial investigators claimed that this indicated that Hans knew he that would have to tap a larger number, thus proving his level of intelligence. Aside from arithmetic, Hans was able to read German. Von Osten had created a table containing every letter of the alphabet designated by a pair of numbers. Hans indicated his ability to read by spelling words by tapping those pairs of numbers. For example, when a picture was shown to him of a horse, Hans spelled the word by tapping *pferd*, the German word for horse. He ignored questions presented by von Osten in other languages such as French or Latin (in which von Osten was also not fluent). As Hans was further tested, it was suggested that beyond the language barrier, he was comparable in development to a human of 14 years of age.

### Skeptics and Tests

Hans had his skeptics, who believed that von Osten was tricking the public. To prove that he

was not, von Osten allowed skeptics to question Hans in his absence. All indications were that von Osten was convinced that Hans was capable of inner speech and independent thought. He also believed that Hans was capable of experiencing and showing emotion. Von Osten offered these emotional states as the explanation when Hans failed to produce the correct answer to a question. The evidence was strong enough that most doubters came to believe that Hans was an exceptional horse.

However, there was a persistent skeptic who was still not convinced—an experimental psychologist named Oskar Pfungst. Pfungst was not satisfied with the evidence that Hans was a wonder horse. He set up several experiments to discover how the horse was able to answer the many questions presented, and whether he was really capable of independent thought. Von Osten was open to allowing the experiments, because he was convinced that Hans was answering the questions.

During the initial experiments, different persons were used to ask Hans the questions. Even without von Osten present, it appeared as though the horse was able to correctly answer the questions. After several experiments were conducted, Pfungst noticed a theme. When Hans's audience did not know the answer to the question, Hans's accuracy severely decreased. Pfungst then had one person whisper a number in Hans's ear, and then a different person would whisper another number in his other ear. Then, Hans was asked to add the two numbers together. Neither questioner knew what number the other had whispered, thus neither knew the answer. Hans either could not produce an answer, or would just continue endlessly tapping.

Subsequent tests also supported the idea that Hans could only answer questions to which the questioner knew the answer. A reading test was conducted in this manner: Words such as "Hans" or "Stall" were written on placards and placed above the horse so that he could see them. However, they were hung in such a way that the experimenter did not know which word was currently presented to Hans. The experimenter would then ask Hans which word was on the placard. When the experimenter did not know the word, Hans guessed incorrectly every time. However, when

the experimenter could see the word, Hans was correct every time.

A memory test was also conducted. Specific numbers were given to Hans at the beginning of the week, and at the end of the week, he was asked to recall the numbers. Hans was unsuccessful at recalling any numbers. Another memory test was conducted in which specific dates were given to Hans and he was to answer what day the dates fell on. Of 14 trials, 10 were unsuccessful and four were successful. However, von Osten was present during this trial and admitted to knowing some of the answers. When dates were questioned that von Osten did not know how to answer, the horse also lost his ability to tap the correct answer.

Pfungst found that the people asking the questions were unconsciously cuing Hans through their body language. Hans was able to read a person's body language, including the slightest movements, such as slightly leaning in and widening the eyes as his taps approached the right answer. Hans could thus sense when his questioner or audience was waiting for him to stop tapping. When Hans saw those signals, he knew he should stop. While this was still a magnificent talent for a horse, Clever Hans was not as clever as originally thought. A combination of audience expectations and a simple behavior resulted in an unintentional lie that convinced many skeptics and taught an important lesson regarding the need for strict experimental controls in evaluating extraordinary claims.

## Clinton, Bill

In one of the most publicly documented instances of American political deception, President Bill Clinton lied to the American people about his extramarital affair with former White House intern Monica Lewinsky. The origin of this scandal dates to November 1995, when the 22-year-old Lewinsky began a relationship with the president during his first term. White House officials suspected mischievous activity between Clinton and Lewinsky before any allegations of misconduct had surfaced. This belief came from personnel who asserted that Lewinsky was spending too much time with Clinton, especially for someone in her low-level position. As a result, Lewinsky was reassigned from her duties at the White House to a job at the Pentagon.

### The Lewinsky Scandal Unfolds

Lewinsky confided in White House colleague and friend Linda Tripp about her relationship with the president. Tripp secretly recorded phone conversations between Clinton and Lewinsky, which would eventually be used as evidence to prove that the president was engaging in an illicit affair with the White House intern. These exchanges included statements of how Lewinsky believed that Clinton had a problem with women, but she hoped that their relationship would never publicly surface so that his presidency would not be compromised. Lewinsky admitted that her biggest fear was not a plagued career because of her actions, but the threat of Tripp divulging information about the affair.

At the same time that Clinton was participating in an extramarital affair with Lewinsky, he was being investigated for involvement in another sexual harassment scandal involving Arkansas state employee Paula Jones. His deposition in this case included a denial of having relations with Lewinsky, which contradicted the phone conversations that were recorded by Tripp. This information was brought to the attention of Kenneth Starr, who was investigating the president and his administration on several matters, such as alleged illegal real estate investments by the Clinton family, improper access to Federal Bureau of Investigation (FBI) security documents, and the improper firing of White House travel officials.

Tripp revealed the recorded phone conversations to Starr in exchange for immunity from prosecution for concealing the Clinton-Lewinsky relationship.

After an extensive investigation, Starr had enough evidence to confirm Clinton's infidelity. The American press broke the news of Clinton's affair, with the first report appearing in the *Drudge Report* on January 17, 1998. Nine days later, on January 26, the president vehemently denied any involvement in a statement that led to criticisms

President Bill Clinton (right), daughter Chelsea Clinton (center), and First Lady Hillary Clinton (left) stroll on the South Lawn of the White House, July 24, 1998, supporting the illusion that all was well in the family circle when, in fact, impeachment over Clinton's perjury and obstruction of justice charges was just months away.

of paltering because he inserted a critical pause between “woman” and “Miss Lewinsky”:

But I want to say one thing to the American people. I want you to listen to me. I’m going to say this again: I did not have sexual relations with that woman... Miss Lewinsky. I never told anybody to lie, not a single time; never. These allegations are false.

This public statement directly contradicted the taped phone conversations from Tripp, as well as physical evidence, including stained clothing. Clinton allegedly had nine separate sexual encounters with Lewinsky. Approximately 11 months after the scandal was reported, the U.S. House of Representatives voted on December 19, 1998, to issue an Article of Impeachment of Clinton for perjury and obstruction of justice. This vote was followed by a 21-day trial in the U.S. Senate. However, the president was acquitted of the charges on February 12, 1999, because the Senate was 17 votes short of removing Clinton from office.

Public reaction to the scandal and impeachment was mixed. In a *USA Today*/Gallup poll, approximately 50 percent of Americans were in support of the Clinton prosecution. However, while the president’s honesty, moral character, and integrity ratings declined, his job approval scores increased.

Although Clinton focused on engaging in the public good after his time in office, including diplomacy, humanitarian relief, and philanthropy, the Lewinsky scandal remains an important part of his legacy. Lewinsky continued to be a presence on public television and to openly discuss the scandal in interviews, editorials, and books.

## Cognitive Dissonance

Cognitive dissonance describes the state of simultaneously holding two or more conflicting cognitions. The aversive state that an individual experiences during this time is described as dissonance and can cause a variety of uncomfortable feelings and emotions such as guilt, anger, or embarrassment. The theory of cognitive dissonance, originally articulated by Leon Festinger in 1957, describes how the aversive nature of dissonance motivates an individual to reduce the uncomfortable state by creating a consonant or consistent belief system. The theory and the seminal research paradigms that have been used to explore it have spawned a variety of theoretical perspectives and countless research efforts. Cognitive dissonance and the related theories directly apply to deception because they help predict the cognitive, emotional, and behavioral reaction that individuals may experience upon telling a lie or deceiving someone, including deceiving themselves.

#### Theory of Cognitive Dissonance

The basic premise of the theory of cognitive dissonance is that individuals are motivated to achieve consonance or consistency among their cognitions, beliefs, ideas, and values. When an individual experiences dissonance because of an

inconsistency in cognitions, it is predicted that he or she will engage in dissonance reduction in an effort to regain consistency. Dissonance reduction can occur in one of four ways: (1) adding a consonant cognition, (2) subtracting a dissonant cognition, (3) increasing the importance of the consonant cognition, or (4) lowering the importance of one of the dissonant cognitions.

One of the first documented accounts of cognitive dissonance that would later lead to Festinger's fully articulated theory is in *When Prophecy Fails* (1956). In this book, Festinger and colleagues report on a small unidentified flying object (UFO) cult that predicted the end of the world. Membership in the cult came at great personal and financial cost to those who joined. When the apocalypse failed to occur, rather than give up on their beliefs, Festinger and colleagues found that the members' beliefs and commitment to the cult and its apocalyptic prediction only strengthened. They believed that their lives had been spared, at least temporarily, to allow them more time to spread their beliefs to others. They responded by fervently attempting to convince others that the end of the world was nigh. Based on the cognitive dissonance theory, the acute dissonance experienced by the cult members after being presented with such irrefutable evidence that opposed their beliefs was reduced by adding a consonant belief that the world would end, but not until they had more time to spread the word and expand their membership.

### Research Paradigms

The experience and outcomes of cognitive dissonance have been explored in numerous research efforts in a variety of contexts. Two of the most prominent research paradigms used in cognitive dissonance research are the free-choice paradigm and the induced-compliance paradigm.

The free-choice paradigm assesses dissonance after a decision or a choice has been made. The theory of cognitive dissonance predicts that once a decision has been made, the cognitions in favor of the choice will be consonant and the cognitions in favor of any alternatives will become dissonant. As two or more alternatives become closer in attractiveness, the greater the amount of dissonance will be experienced. This dissonance can be reduced postdecision by viewing the chosen

alternative as more attractive and the rejected alternative as less attractive.

In 1956, Jack Brehm conducted an experiment in which participants either made an easy decision (between two choices where one choice was much more attractive than the other) or a difficult decision (between two choices that were similar in attractiveness). Participants' attitudes toward each choice were evaluated before and after they made their decisions. Results demonstrated that participants who made the difficult decision saw the rejected alternative as less favorable after they made their choice compared to their prechoice assessment. This was not the case with those who made an easy decision.

The classic experiment conducted by Festinger and James Carlsmith in 1959 implemented the induced-compliance paradigm in an effort to assess the theory of cognitive dissonance. It was hypothesized that dissonance would be elicited when individuals behaved in a manner contrary to their attitudes. Participants were instructed to spend an hour doing a boring, repetitive task. Upon completing the task, participants were asked by the experimenter to tell the incoming participant that the task was interesting and fun. Participants were paid either \$1 or \$20 to do this. Unbeknownst to the participants, however, the incoming "participant" was actually a confederate, and was fully aware of the experimental design. After telling the incoming participant that the task was fun and interesting, the participant's attitude and perceptions of the task were assessed. Findings demonstrated that those paid \$1 expressed more positive attitudes and perceptions of the task than those paid \$20.

The theory explains these findings through the reduction of dissonance by adding a consonant cognition. Those paid \$1 lied to the incoming participant regarding their perception of the task, but did so for very little money. Those paid \$20 also lied, however, they were paid a substantial sum to do so, thus their counterattitudinal behavior was justified. Those paid \$1 had increased dissonance because of inconsistent cognitions—"I am an honest person, but I just lied and did so for a paltry sum." Thus, their dissonance was reduced by adding a consonant cognition to achieve cognitive consonance: "I do believe that the task was fun and interesting, thus, I'm not really a liar."

### Self-Perception Theory

Despite its extreme influence, the original theory of cognitive dissonance has experienced many criticisms. Daryl Bem criticized the theory by stating that individuals do not consider their attitudes, much less whether they are in conflict with one another. Rather, Bem offered the self-perception theory as an alternative perspective. The self-perception theory states that the findings from Festinger's work and related research can be explained through individuals inferring their attitudes from their behaviors. For instance, in the induced-compliance paradigm described above, the self-perception theory would interpret those findings as those who paid \$1 believed that they thought the task was fun and interesting because that is what they said they thought. Alternatively, those paid \$20 had a strong external incentive for their behavior and could identify that the significant monetary reward was the reason that they said the task was fun and interesting.

In 1969, Elliot Aronson expanded upon the self-perception theory by introducing the idea of the self-concept. Aronson emphasized that cognitive dissonance is elicited when conflicting cognitions threaten one's positive self-image or self-concept. Individuals are motivated to return their self-concept to one of a good or an honest person. Aronson's further work explicates and tests the concept of self-justification as an extension of this theoretical perspective.

### Implications for Deception

The theorizing, studies, and findings from research focused on cognitive dissonance and its related constructs directly apply to the study of deception, and in particular self-deception. The experience of cognitive dissonance and the mechanisms for dissonance reduction occur internally within the individual. This process is thought to occur in an effort to return an individual's cognitions or self-concept to one of consistency and, ideally, to one in which the individual can view himself or herself as a good and honest person. This can occur in varying levels of severity.

The experiment conducted by Festinger and Carlsmith demonstrates the self-deception that occurred in participants who were only paid \$1 to lie to the incoming participants. In this case, these individuals added the consonant cognition

of "the task was fun and interesting" so that their attitudes were aligned with their behavior. Simply put, they convinced themselves or lied to themselves that their experience with the task was indeed positive. Similarly, findings from Brehm's work suggest that self-deception or justification of behavior can occur when a difficult decision is made. These outcomes provide evidence that lying or deceiving another can induce cognitive dissonance, whereas lying to oneself may be used to reduce that dissonance.

Furthermore, engaging in behavior that is inconsistent with a positive self-image or self-concept can also influence individuals' general perceptions of that behavior. For example, in 2003, Eric Storch and Jason Storch found that students who engaged in academic dishonesty were more likely to approve of academic dishonesty in general. Findings such as these would indicate that engagement in inconsistent behaviors or behaviors that elicit cognitive dissonance (e.g., "I'm an honest person but I have cheated on an exam") result in strategies that are self-deception, and also change perceptions of that behavior (academic dishonesty) in others.

Despite criticisms, cognitive dissonance and the theory of cognitive dissonance have stimulated countless research efforts that span over half a century. Although this research offers implications for a variety of social and cognitive areas of interest, it especially informs the study of deception. In particular, it offers implications for the cognitive processes that occur when individuals experience inconsistent cognitions or behave inconsistently with their attitudes, including engaging in acts of deception. Research indicates that engaging in the deception of others can elicit dissonance, and acts of self-deception may be used to rationalize those acts in an effort to align cognitions back to a state of consonance.

## Cognitive Heuristics

Research indicates that lie detection accuracy rates are only marginally better than chance, and a variety of cognitive heuristics and biases may be responsible for these low accuracy rates. Cognitive heuristics are basic decision rules formed by one's beliefs and expectations, and people are more likely to rely on heuristics when they lack the motivation and/or ability to adequately process information. These mental shortcuts can be beneficial (e.g., they allow one to make decisions quickly), but they also can lead to biases and inaccurate judgments because of the reliance on a limited number of informational cues.

### Examples of Cognitive Heuristics

Many of the heuristics relevant to lie detection are related to the fundamental attribution error (sometimes referred to as the correspondence bias), or the tendency to attribute people's behavior to personality traits or internal characteristics, rather than the situation or external causes. One example from the lie detection domain is the Othello error, in which nervousness is perceived as a sign of deception, disregarding that the situation (e.g., being interrogated by the police) may

actually be the source of the person's anxiety. The Othello error can also be explained by the representativeness heuristic, which in this application would mean being more likely to conclude that someone is deceptive because his or her nervousness is consistent with the prototype of a liar's demeanor.

The facial appearance heuristic pertains to the stereotype that people with more attractive or "baby" faces are more likely to be honest, which often leads people astray. In one study, participants who attributed positive characteristics to the individual they were judging rated that person as more truthful, and consequently, were less accurate at detecting that person's lies.

The truth bias or truthfulness bias is the tendency to perceive the truth over lies when judging a message, or to perceive honesty over dishonesty when judging a person. The truth bias is more pronounced in face-to-face conversations and when interacting with close others such as romantic partners, good friends, or family members, leading some to call it the relational truth-bias heuristic.

Various explanations have been offered for the truth bias, including reliance on other heuristics. One explanation involves applying the availability heuristic or the belief that examples or events that more easily come to mind more frequently occur. According to this explanation, people are more likely to recall examples of honesty, and are therefore more likely to conclude that the statement in question also is the truth, rather than a lie. Others have proposed that one's default assumption is the truth, and only if one has the time, motivation, and energy to think more about a message will they be less credulous. A similar explanation has been offered for the fundamental attribution error; that is, one's default judgment is a disposition, and greater effort is required to adjust that judgment to consider situational factors.

Related to this idea is the application of the anchoring or anchoring-adjustment heuristic, which pertains to the failure to adequately correct away from a starting value (i.e., an anchor). If people are more likely to initially view a message as truthful, then based on the anchoring heuristic, even if they try to adjust, their final judgment still will be closer to the honest than the dishonest end of a continuum.

The falsifiability heuristic has also been offered as an explanation for the truth bias, at least when the lie pertains to something subjective. According to the falsifiability heuristic, individuals may, somewhat paradoxically, deem something deceptive if too much of the content is objective or easily verified (e.g., observable behaviors or factual references), and conversely perceive something as truthful if the content is subjective or not easily verified (e.g., feelings, emotions, or attitudes). The falsifiability heuristic has been shown to occur when people provide too much information or use a more salient medium of communication. An example of the latter comes from a study in which the same message was less likely to be believed if it was presented via audiotape than in written form.

Another paradoxical heuristic is the probing heuristic. Research has shown that people are more likely to believe someone after they have had the opportunity to put the person on the spot by asking him or her follow-up questions. This heuristic may be a more specific example or combination of the representativeness and truth bias heuristics. That is, people typically believe that lying requires more cognitive effort than telling the truth. Accordingly, a person would struggle to immediately devise a deceptive response to probing questions, but would provide truthful answers with relative ease. When probing questions yield quick and seemingly effortless responses, as typically occurs regardless of whether the respondent is lying or telling the truth, then the questioner is more likely to view the respondent as honest, rather than dishonest.

Most people believe that nonverbal behaviors (e.g., tone of voice and eye gaze) are altered when an individual is lying, rather than being truthful, but truth-telling can be accompanied by increases or decreases in nonverbal behaviors. The visual bias leads individuals to disregard vocal, linguistic, and other social indicators of deception and instead place emphasis on visual and facial cues, which may not be reliable indicators of deception. Also related to nonverbal displays, the nonverbal conspicuousness heuristic leads individuals to interpret unusual or odd nonverbal behavior (e.g., very slow speech) to be indicative of deception, and the expectancy-violation heuristic leads people to interpret unexpected behaviors (e.g., keeping one's eyes shut during a conversation)

as evidence of dishonesty. The latter, however, should not be confused with the infrequency heuristic, in which people are more likely to judge another person's report of an unexpected or rare event as fraudulent.

### Police Officers

Police officers, with all of their experience and for whom lie detection is even more important, are not markedly better at lie detection than laypeople. In contrast to laypeople, whose default is truth, police officers often have a deception or lie bias and instead believe that other people are more likely to be dishonest than honest. This tendency actually becomes more pervasive the longer they are on the job and may explain why some research has shown that police officers are better at detecting lies than detecting the truth.

Individuals often seek out information that will confirm already-held beliefs and avoid information that will disconfirm their beliefs, known as the confirmatory bias. When police officers rely on this bias during interviews, it can lead to a self-fulfilling prophecy by evoking specific behaviors from the suspect that seem to confirm or support the officer's prior conclusions about guilt or innocence. For example, a police officer may treat an assumed innocent person more gently, which puts the person at ease and helps them think more clearly, thus making them appear less nervous. In contrast, a person assumed to be guilty may be more likely to be threatened or treated in a harsher manner, making the person more agitated and more easily confused. Police officers will sometimes accuse a suspect of the crime in an attempt to evoke a confession. In such a situation, a suspect, innocent or guilty, may begin to exhibit signs of fear and/or nervousness, and the Othello error might increase the chances that a police officer will view the suspect's nervousness as a sign of lying or guilt rather than attributing the person's behavior to the situation or to the officer's actions.

Although knowledge of heuristics and biases is often not sufficient to make people less susceptible to their influences, certain factors (including personality variables) that increase people's motivation and ability to process have been successful in reducing biases. In the lie detection domain, simply increasing participants' suspiciousness

(e.g., reminding them that not everyone may have been truthful) has been effective in diminishing use of these heuristics.

years. It consists of two approaches. The imposing-cognitive-load approach aims to make the interview setting more difficult for interviewees. This should affect liars more than truth-tellers, resulting in more and more blatant cues to deceit. The strategic-questioning approach examines different ways of questioning that elicit the most differential responses between truth-tellers and liars.

### The Imposing-Cognitive-Load Approach

Cognitive load can be defined as a multidimensional construct representing the effort that performing a particular task imposes on the actor's cognitive system. Lying can be more cognitively demanding than truth-telling, particularly during interviews. Formulating the lie, monitoring and controlling behavior, monitoring whether the interviewer appears to believe the lie, role-playing, justifying the lie, and suppressing the truth all add to cognitive load.

An investigator could exploit the different levels of cognitive load that truth-tellers and liars experience in order to more effectively discriminate between them. Liars who require more cognitive resources than truth-tellers will have fewer said resources left over. If cognitive demand is further raised, which could be achieved by making additional requests, liars may not be as good as truth-tellers in coping with these additional requests.

One way to impose cognitive load is by asking interviewees to tell their stories in reverse order. This increases cognitive load because it runs counter to the natural forward-order coding of sequentially occurring events, and it disrupts reconstructing events from a schema. Another way to increase cognitive load is by instructing interviewees to maintain eye contact with the interviewer. When people have to concentrate on telling their stories—which is likely when they are asked to recall what has happened—they are inclined to look away from their conversation partner (typically to a motionless point), because maintaining eye contact is distracting.

In two experiments, half of the liars and truth-tellers were requested to recall their stories in reverse order (Experiment 1) or to maintain eye contact with the interviewer (Experiment 2), whereas no instruction was given to the other half of the participants. More cues to deceit emerged in the reverse-order and maintaining-eye-contact

## Cognitive Load

The cognitive lie-detection perspective is a new lie-detection approach that has been tested by scholars in university labs over the last five to 10

*U.S. Army Pfc. Samantha Desvoignes, left, a human intelligence collector, conducts interrogation training with Sgt. Jeneane Eurell, role-playing as a prisoner during an exercise at Fort Hood, Texas, June 4, 2013. The cognitive-load perspective of lie detection consists of two approaches: the imposing-cognitive-load approach, which aims to make the interview setting more difficult for interviewees, and the strategic-questioning approach, which examines different ways of questioning that elicit the most differential responses between truth-tellers and liars. Lying can be more mentally demanding than truth-telling, particularly during interviews.*

conditions than in the control conditions. Moreover, observers who watched these videotaped interviews could distinguish between truths and lies better in the reverse-order and maintaining-eye-contact conditions than in the control conditions. For example, in the reverse-order experiment, 42 percent of the lies were correctly classified in the control condition, well below the amount typically found in verbal and nonverbal lie-detection research, suggesting that the lie-detection task was difficult. Yet, in the experimental condition, 60 percent of the lies were correctly classified, more than is typically found in this type of lie-detection research.

### **Strategic-Questioning Approach**

A consistent finding in deception research is that liars prepare themselves when anticipating an interview. Planning makes lying easier, and planned lies typically contain fewer cues to

deceit than spontaneous lies. However, the positive effects of planning will only emerge if liars correctly anticipate which questions will be asked. Investigators can exploit this limitation by asking questions that liars do not anticipate. Though liars can refuse to answer unanticipated questions, “I don’t know” or “I can’t remember” responses will create suspicion if the questions are about central (but unanticipated) aspects of the target event.

In the first experiment to test the unanticipated-questions technique, pairs of liars and truth-tellers were individually interviewed about having had lunch together at a restaurant. Whereas the truth-tellers actually had lunch together, the liars did not but were instructed to pretend that they had. All pairs were given the opportunity to prepare for the interview. The interviewer asked conventional opening questions (e.g., “What did you do in the restaurant?”) followed by questions about spatial

details (e.g., “In relation to where you sat, where were the closest diners?”), and temporal details (e.g., “Who finished their food first, you or your friend?”). Further, they were asked to sketch the layout of the restaurant.

The spatial questions and drawing requests came as a surprise to interviewees (this was established after the interview). Based on the overlap in responses to the anticipated questions between the two pair members, the liars and truth-tellers were not classified above chance level. However, based on the responses to the unanticipated questions, up to 80 percent of pairs of liars and truth-tellers were correctly classified (i.e., the answers to spatial questions and the answers to drawings were less alike for pairs of liars than for pairs of truth-tellers). Asking unanticipated questions about central topics therefore elicited cues to deceit.

### Devil's Advocate Approach

Spatial and drawing requests are unsuitable when examining lying about opinions. Determining the veracity of such conceptual representations can be important in security settings, as demonstrated by the loss of seven Central Intelligence Agency (CIA) agents in Afghanistan in December 2009. They were killed in a suicide attack by a man who they believed was going to give them information about Taliban and Al Qaeda targets in Pakistan's tribal areas. The CIA was aware that this man had posted extreme anti-American views on the Internet but believed these to be part of a cover.

The devil's advocate technique aims to detect deception in expressing opinions. Interviewees are first asked an opinion-eliciting question that invites them to argue in favor of their personal view (e.g., “What are your reasons for supporting the United States in the war in Afghanistan?”). This is followed by a devil's advocate question that asks interviewees to argue against their personal view (e.g., “Playing devil's advocate, is there anything you can say against the involvement of the United States in Afghanistan?”).

People normally think more deeply about, and are more able to generate, reasons that support rather than oppose their real beliefs. Therefore, truth-tellers are likely to provide more information in their responses to the true opinion eliciting question than to the devil's advocate question.

This pattern is unlikely to occur in liars because for them, the devil's-advocate question is more compatible with their beliefs than the opinion-eliciting question. In effect, for liars, the devil's-advocate approach is a set-up wherein they first lie when answering the opinion-eliciting question and then are lured into telling the truth when answering the devil's advocate question.

In an experiment, participants were asked to tell the truth or lie about their views regarding issues they felt strongly about, including the war in Iraq. Truth-tellers' opinion-eliciting answers were longer than their devil's advocate answers, whereas no differences emerged in liars' answers to the two types of questions. Based on this principle, 75 percent of truth-tellers and 78 percent of liars could be correctly classified.

### Conclusion

The cognitive lie-detection approach is designed to differentiate between truth-tellers and liars by making the interview setting more difficult, which should affect liars more, or by asking questions that liars have not anticipated, and thus have not prepared answers for. Research has shown support for this innovative lie-detection approach.

## Coherence and Correspondence

Coherence and correspondence are lie-detection concepts advanced by J. Pete Blair of Texas State University, Torsten Reimer of Purdue University, and Timothy Levine of Korea University. They reflect two different ways of understanding what it means to be consistent. Statements can be consistent or inconsistent in different ways, and coherence and correspondence address an important distinction between types of consistency information as related to deception and deception detection. As a method of lie detection, correspondence is superior to coherence.

Coherence refers to the logical consistency within a single statement or between two or more statements. A single statement is coherent if it is not self-contradictory. Two statements are coherent if one does not contradict the other. If a person says, “Steve is my friend,” but later denies knowing anyone named Steve, his statements do not cohere. Logically, one must be false. But if the same person says, “Steve is my friend,” and then says, “Steve and I have known each other for a long time,” coherence is maintained.

Correspondence, on the other hand, refers to the consistency between a statement and some evidence or prior knowledge. A statement may be assessed to determine if it corresponds with the facts as they are known, or if it is inconsistent with the facts. Statements that contradict facts are said to lack correspondence and can be judged as objectively false, while statements that conform to evidence are true. For example, if a person says, “I don’t know anyone named Steve,” but another person has seen them together often and has read research that they coauthored together, his statement about not knowing Steve lacks correspondence and can be judged false. But if the same person says that he has coauthored work with Steve, and someone conducts an Internet search that shows that he has indeed coauthored several research articles with Steve, it can be concluded that his statement is true.

The general ideas of coherence and correspondence have a long history in philosophy and science. Any theory that is true needs to be

internally consistent (coherence) and consistent with known facts (correspondence). Theories that are self-contradictory or that contradict known facts are rejected and do not count as valid knowledge.

### Deception Detection

Coherence and correspondence information are often used as indications of lies in deception detection. H. S. Park and colleagues’ examination of reported deception-detection methods, conducted in 2002, showed that variations on coherence and correspondence were involved in a substantial majority of detected lies. People detected lies by obtaining contradictory information from other people, by comparing statements to physical evidence or prior knowledge, and by soliciting confessions of deception. P. A. Granhag and L. A. Stromwall came to a similar conclusion about the frequent use of consistency in assessing other’s honesty. People often use consistency information to assess honesty. Inconsistency is seen as an indication of dishonesty and is used as a deception cue. More recently, correspondence information was shown to be at the core of effective lie-detection methods, such as the strategic use of evidence examined by M. Hartwig and colleagues in 2005 and content in context as examined by Blair and colleagues in 2010.

Despite their prominence in philosophy and science, coherence and correspondence are not perfect indicators of deception. While it may be the case that statements that are self-contradictory, inconsistent with other statements, and/or contradict known facts may either be false or provide legitimate reason for doubt, it is not the case that these statements are necessarily indications of deception. First, with regards to coherence, while incoherence may signal that something is not right, false statements can be coherent. That is, coherence alone is not sufficient evidence of truth. Further, regarding multiple statements, if two statements are contradictory, one or the other might be true, and it is often unclear which statement to believe. Moreover, just because people contradict themselves from time to time does not mean that they have deceptive intents. People’s everyday talk is often not perfectly logical, people’s memories are far from perfect, and statements that appear inconsistent on the

surface may not be inconsistent when more information is learned. Even statements that are known to be factually false may stem from an honest mistake or misunderstanding, rather than deceptive intent.

Blair and colleagues contend that correspondence information is generally more useful in detecting lies than coherence information. Information that contracts facts is likely false. But people can lack coherence when they are honest, and liars may make greater efforts to appear logically consistent. When comparing statements from multiple individuals, people can collude to produce consistent but false statements that are highly believable. Thus, correspondence is probably a more useful tool in lie detection than coherence.

## Cold Fusion

The detection of cold fusion reactions was made public on March 23, 1989, by Stanley Pons, professor of chemistry, and Martin Fleischmann, professor of electrochemistry, of the University of Utah at a press conference prior to publication of a rushed technical article. Historically, there had been earlier claims of cold fusion discoveries in the 1920s and 1930s, but none of these could be reliably demonstrated or replicated.

Cold fusion as envisioned by the Pons and Fleischmann experiments has been relegated to a level of pathological science, pseudoscience, or voodoo science, whereby belief and research in the topic are fraught with unsubstantiated evidence. The researchers' self-deceptions were caused and perpetuated by the initial meteoric media frenzy and subsequent professional pressures.

Cold fusion is a type of nuclear reaction that can occur at low temperatures, such as room temperature, yet generates high levels of energy, with more energy produced than consumed in the reaction. Currently, there is no unequivocal science that supports an operative cold fusion reaction. Cold fusion reactions seemingly violate laws of thermodynamics, which suggest that a physical closed system (such as a cold fusion reaction) cannot continue to generate energy without exhausting itself or reaching entropy. Cold fusion may be contrasted with "hot" fusion reactions, which occur well into the million-degree mark (the sun is an example of a fusion reaction, as is a hydrogen bomb explosion), and the more familiar nuclear fission reactions from which nuclear power is generated.

Why the drive and fascination for cold fusion reactions? The attractive features of these reactions are that the required fuels are easily obtainable or created, the byproducts are low on pollutants, and radioactive waste is short-lived. Therefore, to discover a viable cold fusion reaction would make the creation of energy extremely efficient, inexpensive, and resulting in few, if any, dangerous byproducts.

#### Flawed Research

What role did deception and lies play in the cold fusion research of the late 1980s? Initially, Pons and Fleischmann unknowingly had

methodological flaws in their experiments, so they believed in their findings. This in and of itself is not deception; methodological flaws do sometimes occur in any scientific research field. However, such mistakes are discovered during the article-writing phase by researchers, or during the peer-review phase prior to scientific publication. Because of competing research at Brigham Young University that was poised for release by another researcher, the University of Utah held a press conference, with Pons and Fleischmann releasing their findings prior to publication of a less than scientifically rigorous article. Coupled with a slow news cycle, a torrent of news stories ensued, and within a few weeks announcements by additional scientists from respected institutions noted similar cold fusion reaction findings (ultimately, these were also found to have methodological problems). Grant money was also provided to Pons and Fleischmann within the initial weeks after the University of Utah's press conference.

Thus, Pons and Fleischmann's research findings were initially supported by other researchers, hailed in the media, and rewarded through grant money. By the time other academics, elite academic research institutions, and a better informed media (for example, the *Los Angeles Times* and the *New York Times*) began questioning the findings, the cold fusion effect as reported by the researchers had become reified. Self-deception for these researchers, driven by the positive reinforcement after the announcement and fear of public and academic embarrassment, was now evident. For Pons and Fleischmann to simply state "we made an error" was not seen as an option.

Further, the social psychology of attitudes and persuasion may have also influenced their decision to adhere to their findings. Pons and Fleischmann's public media events led to increased ego involvement (as described by M. Sherif and H. Cantril), and thus their commitment to the findings, even in the face of failed replication, was anchored in self-protection. Seeking congruency across what they reported and believed regardless of later research, may have also played a role similar to Leon Festinger and colleagues' report on a doomsday group's reaction to a failed end-of-the-world prophecy.

Strong beliefs in phenomena that are seemingly anchored in flawed science or colored realities are often maintained by individuals, regardless of unequivocal counterarguments or evidence, especially when situational pressures are strong. Strong situations lead to conformity, even in the face of untruths.

Though Pons and Fleischmann's subsequent papers failed to show support for their findings because of methodological issues, both researchers continued to claim that the initial effects that they recorded were real. In addition to the grant money from the University of Utah, they received research funds in the 1990s from private sources. However, their subsequent research in the 1990s yielded little if any progress on the topic.

Fleishman died on August 3, 2012. Because the term *cold fusion* currently has a negative connotation, those who continue to study the phenomena refer to it as a "nuclear effect," or "low energy nuclear reactions." The topic continues to receive popular press, but little is published in mainstream, peer-reviewed science journals.

## College Sports

College sports are athletic competitions played on both the competitive and recreational level at colleges and universities. While some college sports are sanctioned by a variety of organizations, others are available to any member of the student body who would like to engage in them. Lying and deception are sometimes perceived as problems in college sports, especially within the context of major college athletic teams. As the popularity of college sports has grown, and as increased revenue has become available as a result of contracts with broadcast and cable television companies, so has the temptation for certain individuals to attempt to profit from behaviors that give them an unfair advantage over rivals. Multiple groups, including sanctioning bodies, law enforcement agencies, and government departments, have attempted to curtail lying and deception in college sports.

### Background

College sports have existed for over 180 years on a formal basis, although students have informally engaged in athletic endeavors since the establishment of higher education. To this day, many students participate in intramural and recreational club sports, which are available to practically all members of the student body. Intercollegiate athletics, in which sports teams from one college or university compete against those of another, originated as informal student-led activities. In 1843, students at Yale University formed a boat club, followed a year later by students at rival Harvard University. While these boat clubs initially pursued opportunities to practice only on their campus and with teach school's students, by 1852 a competition was scheduled between the two schools. The race took place at Lake Winnepesaukee in New Hampshire, and led to other competitions between the two.

The growing popularity of games involving bats and balls, such as early forms of baseball, grew in popularity during the 19th century. In 1859, teams from Amherst College and Williams College played each other in a baseball game, which proved so successful with students from both schools that regularly played games were scheduled from this point forward. By 1870, baseball teams from a variety of colleges

and universities were playing regular schedules. The Intercollegiate Baseball Association (IBA), the first baseball league, was formed in 1879 by Harvard, Amherst, Brown University, Princeton University, and Dartmouth College. Yale initially refused to join the IBA because it permitted professional players to participate, but the university joined the following year. Less than a decade later, in 1887, Harvard, Princeton, and Yale withdrew from the IBA, and formed the Eastern League with Columbia University. Although the membership of both leagues frequently changed, this set a model for future intercollegiate athletics.

However, with the advent of intercollegiate football competitions, college sports grew to new heights of popularity. The first collegiate football game was played between Princeton and Rutgers University in 1869, and in 1873, representatives from Columbia, Princeton, Rutgers, and Yale met in New York City to agree upon a common set of rules that would govern the game. This led to an explosion of popularity of the sport, and the foundation of historic rivalries between both large schools (for example, the University of Minnesota and the University of Wisconsin first met in 1890) and small schools (for example, Knox College and Monmouth College first played in 1888).

This growth in popularity was not without its downside; between 1890 and 1905, 330 men died playing college football. As a result, the Intercollegiate Athletic Association of the United States (IAAUS) was formed in 1906 to make the game safer for players. The IAAUS changed its name to the National Collegiate Athletic Association (NCAA) in 1910, and worked to develop rules to make the game safer and to protect players. The organization added sports for women in 1980. By 2013, the NCAA had over 1,280 member institutions, and was organized into three divisions, two of which (Divisions I and II) can offer athletic scholarships and one (Division III) that cannot. The NCAA offers 23 sanctioned sports, only two of which (baseball and wrestling) are sanctioned for men only. Bowling, field hockey, rowing, and softball are sanctioned for women only.

The National Association of Intercollegiate Athletics (NAIA) is a rival to the NCAA, serving about 250 schools and sanctioning 23 sports.

Issues regarding rules and compliance thereto are settled by the NCAA or the NAIA.

### **Lying and Deception in College Sports**

A variety of situations exist in which lying and deception can affect college sports. There are situations in which a coach or team will behave in ways that are prohibited by the appropriate sanctioning body. Such infractions are usually undertaken to gain an unfair competitive advantage over rivals, and are generally frowned upon and prohibited by the institution at which that coach is employed. Also problematic are cases in which an individual athlete will engage in certain behavior that is forbidden. The reasons for this noncompliance are more varied, as a student athlete might engage in lying and deception to gain an unfair competitive advantage, to monetarily benefit, or for some other reason. Common instances involving lying and deception in collegiate athletics include recruiting violations, game-related infractions, athletes receiving improper benefits, or gambling scandals. All such behaviors are serious, although each has different repercussions for the athletes involved and the schools that they attend.

### **Recruiting Violations**

Athletes who participate in college sports are amateurs, and are not allowed to be paid for playing for their college or university. However, because the recruiting of a star player or athlete can have a tremendous positive impact on a team's success, many coaches and college or university boosters are tempted to provide student athletes with illegal compensation in order to convince a player to commit to a given team. The improper compensation might include cash, a summer job, an automobile, or some other benefit to the student. In recent years, payments to students' families have also drawn scrutiny from the media and other schools. Because member institutions in both the NCAA and the NAIA agree to certain restrictions on recruiting when they join the organization, lying and deception related to recruiting diminishes the community of trust that such groups try to engender.

A classic case of recruiting violations, and the harm they can cause to a rogue college or university sports program, involved the Southern

Methodist University (SMU) football team during the 1980s. The SMU Mustangs had a long and storied history, having won the 1935 national championship and 10 Southwest Conference (SWC) titles, and they played in 11 bowl games. Although SMU football had been most successful during the 1940s and 1950s, when star halfback Doak Walker won the Heisman Trophy, the Mustangs went 45–5–1 from 1980 through 1984, finishing second in the final national polls in 1982. SMU achieved this success, despite being one of the smaller schools in the SWC, with its 9,000 students far fewer than the much larger enrollments at rivals such as the University of Texas (with over 50,000 students) and Texas A&M University (with over 45,000 students).

While other SWC schools had also been charged with recruiting violations, SMU was found to have paid several recruits and their families thousands of dollars to sign with the Mustangs. After having been placed on probation by the NCAA for doing this, it was found that SMU boosters had continued to make payments to players, with the knowledge and consent of the coaching staff. As a result, SMU was given the NCAA "death penalty," which meant that its football program was suspended for the 1987 season and denied its four scheduled home games in 1988. SMU also lost 55 scholarship positions and was given a television and postseason bowl ban that lasted through 1989. Additionally, multiple boosters were banned from contact with the football program, and on-campus visits by recruiters were prohibited through 1989.

### **Performance-Enhancing Drugs**

Certain substances, often called performance-enhancing drugs, are used by athletes in an attempt to improve their accomplishments on the playing field. Performance-enhancing drugs encompass a variety of substances, but the term is most often used when discussing anabolic steroids and other such preparations that play a role similar to that of testosterone in the body, building muscle mass by increasing the level of protein present in cells. First produced during the 1930s, anabolic steroids are banned by both the NCAA and the NAIA because of the competitive advantage that they provide users, as well as the negative effects that users undergo. These negative

effects include increased risk of cardiovascular and heart disease, elevated blood pressure, liver damage, testicular atrophy, and cardiac arrhythmia. Additionally, aggression, psychosis, mood disorders, addiction, and increased risk of suicide have been linked to use of performance-enhancing drugs. Stimulants, painkillers, sedatives, diuretics, other lean-mass builders, and blood-masking agents are banned by the NCAA and the NAIA for similar reasons.

In an effort to discourage the use of performance-enhancing drugs by student athletes, both the NCAA and the NAIA conduct drug testing programs. These programs are intended to identify violators of the established drug policies and discourage students who might be considering using performance-enhancing drugs. The NCAA, for example, has developed a program of drug testing that has three separate checkpoints intended to promote a drug-free environment.

First, school-sponsored testing is permitted, which allows individual institutions or conferences to conduct their own testing programs. Second, approximately 11,000 Division I and Division II athletes are randomly tested each year for steroids, diuretics, masking agents, and other substances. Finally, the NCAA tests student athletes in all three divisions at championship events at least once every five years, resulting in over 2,500 annual screenings. Through this system, the NCAA works to preserve fair competition and protect student athletes' health.

### Other Criminal Acts

College sports have also been rocked from time to time by other assorted criminal acts. When student athletes or their coaches become involved with gamblers, sexual scandals, or the trading of tickets or jerseys for other goods, these acts may have broad repercussions for the college or university, the

*Ohio State University (OSU) quarterback Terrelle Pryor and teammates congratulate one another during a game in Minnesota, September 27, 2008. In 2010, OSU suspended five football players for five games at the beginning of the 2011 season after discovering that the players had traded autographs for tattoos. OSU head coach Jim Tressel was later dismissed after it was revealed that he had known about the infractions but had lied to investigators about them. The lying and deception that occurred after the actual infractions intensified the subsequent punishments that the university received from the National Collegiate Athletic Association.*

coaching staff, or the athletes involved. Although such actions are in themselves often against NCAA or NAIA rules or procedures, situations are often exacerbated for the individuals or schools involved when lies or other deceptive statements are made in an attempt to cover up the matter. When such obfuscations are discovered, they inevitably cause the consequences for the athletes, coaches, and colleges or universities to be more severe than would otherwise have been the case.

Point shaving, a type of fixing in which players attempt to adjust the score of a game so that a particular point spread is or is not met, is particularly effective in basketball. During the 1978–79 NCAA men's basketball season, players from the Boston College (BC) team accepted cash payments to ensure that their team would not win by the expected margin, allowing gamblers who had bet that the team would not cover the point spread to reap large gambling wins. When the team's contact was arrested on other charges, he disclosed the operation to the police, earning a lighter sentence. The BC players who had been involved were sentenced to terms in prison of from 4 to 20 years.

The Pennsylvania State University (PSU) football program was rocked in 2011 when long-time assistant football coach Jerry Sandusky was charged and later convicted for sexually molesting numerous children. When it was disclosed that PSU head coach Joe Paterno and other university officials had knowledge of these crimes as early as 1998 but failed to report it to the proper authorities, Paterno, the PSU president, and various other university officials were fired, and many were charged with crimes. The NCAA placed PSU's football program on a five-year probation, enforced a four-year postseason ban, vacated 112 victories, fined PSU \$60 million, and eliminated 40 football scholarships.

In 2010, Ohio State University (OSU) announced that it was suspending five football players for five games at the beginning of the 2011 season as a result of the discovery that these individuals had traded autographs for tattoos. When it was later discovered that OSU head coach Jim Tressel had known about these infractions and lied to NCAA investigators about them, he was dismissed as OSU's coach and the university was placed on probation, banned from bowl games for a year,

made to relinquish nine scholarships, and forced to vacate 10 2010 victories. Lying and deceptive statements made all three incidents worse for the players, coaches, and universities involved.

## Colleges and Universities, For-Profit

Since 2000, enrollment at for-profit colleges and universities has surged as a result of many Americans' increased optimism in the ability of

for-profit universities to provide higher education to a greater proportion of the population. The profit-seeking nature of for-profit companies, however, produces incentives that have led some of these institutes to engage in deceptive practices in order to increase enrollment.

For-profit colleges and universities such as University of Phoenix, DeVry University, and Kaplan University, are owned by private, profit-seeking businesses and are often publicly traded or owned by private equity firms. For-profit universities grew over 14 percent between 2003 and 2004. These institutions can provide the means to meet the rising demand for a university education in the United States, especially for nontraditional students who attend college later in life, those who work while getting a degree, and those who are raising children while obtaining their degree. Through online classes and highly structured programs, for-profit universities are thought to help reduce the barrier to education.

Critics of for-profit education believe that Congress has failed to regulate these schools' profit-seeking incentives. In 2011, taxpayers paid \$32 billion to companies that own these institutions. Conversely, strong proponents of for-profit universities believe that the government should not meddle with markets, even if those markets deal with a public good such as education. Since the early 1990s, numerous allegations have surfaced in opposition to certain moneymaking practices of for-profit universities.

In order to regulate the for-profit sector of education, legislation within the United States has been applied, modified, and created to keep educational institutions honest. The Higher Education Act has regulated postsecondary education since 1965 and is reapproved every five years. Reforms to this act occurred in 1992 after an investigation of for-profit institutions by the U.S. Senate Permanent Subcommittee on Investigations. In the 1980s, concern about the dropout rate of students at for-profit colleges resulted in the enactment in California of the Maxine Waters School Reform and Student Protection Act of 1989. This law cited the unfair and deceptive operations of for-profits, such as misrepresenting facts at enrollment, and it imposed stricter regulations, such as minimum program completion rates and minimum employment rates.

### **The Harkin Report**

From 2010 to 2012, for-profit colleges and universities were investigated by Senator Tom Harkin (D-Iowa), resulting in a report rebuking these institutions' unjust profit-seeking practices. The senator's team discovered deceptive practices at for-profit universities through an in-depth examination of 30 companies providing for-profit education. This examination involved a process that included numerous interviews with employees and students, as well as sending undercover investigators to experience the recruitment processes.

Released on July 30, 2012, Harkin's report pointed to evidence of deception occurring in the following categories: cost and financial aid, graduation and postgraduation success statistics, accreditation, and sales tactics. The report contends that some institutions deliberately underproject the number of terms that a student will need to complete a degree. Other universities only state the price of attending their school for one term, rather than the yearly cost. Prospective students might also assume that there will be two or three terms per year, as is conventional at most universities. However, some colleges (e.g., Westwood College) have five terms per year. The report concludes that these tactics can lead students to have false beliefs upon enrollment.

The Harkin report also cited instances in which recruiters were instructed to evade questions from prospective students regarding the total cost of obtaining a degree, citing such practices at National American University. Other for-profit institutions were found to deliberately hide financial aid information from prospective students. This omission is a form of deception that obscures the cost of the degree and how students may pay for it. Recruiters were also found to falsely convey statistics regarding student success, as is evident from institutions such as Potomac College, Kaplan College, and Bennett Career Institute. These organizations overestimated their graduation rates and postgraduation salary statistics, misleading prospective students about their likelihood of graduating and potential salaries.

Harkin's team found further deception in university accreditation. Even though a for-profit college can be nationally accredited, it does not mean that the institution is also regionally accredited, as are major nonprofit and public colleges, as well

as some for-profit schools. Many for-profit institutions are nationally accredited, which means that they are recognized by an agency that primarily deals with vocational or distance-learning institutions. Credits earned at nationally accredited schools are often not accepted at regionally accredited schools. Recruiters were found to take advantage of the students' lack of knowledge about this topic; the confusion between national and regional accreditation was deceptive on the part of many universities. This has implications when students attempt to transfer credits from a for-profit college to a regionally accredited school, and may not be able to do so.

Finally, the report found that recruiters are often instructed to use deceptive sales tactics in order to earn the institution money in lieu of students' best interests. One such technique was discovered at Career Education Corporation, which instructed its recruiters to not give prospective students much information. Further, Harkin alleged that some colleges instructed recruiters to use "pain points" from the prospective students' pasts to pressure the students into enrolling, "overcome objections" to enrolling, and make enrollment seem urgent. This sales tactic deceives prospective students by placing undue pressure on them to enroll in the university.

The University of Phoenix is a for-profit university that has been accused of violating the Higher Education Act and other regulations. In 2003, two former recruiters for the university filed a whistleblower lawsuit alleging that the institution paid recruiters based on the number of students that they enrolled. This led to the university gaining hundreds of millions of dollars in financial aid and directly infringed upon the Higher Education Act. The U.S. Department of Education investigated the matter and found that the University of Phoenix used unethical and illegal sales practices, such as encouraging recruiters to enroll underqualified students through bribes. The university did not admit offense but settled by paying \$9.8 million to the Department of Education in 2004, and \$78.5 million in 2009.

The growth of for-profit colleges and universities is undisputed, even as the business practices of these companies are scrutinized. Many reports and investigations have described numerous deceptive practices at for-profit colleges,

specifically in the areas of cost and financial aid information, graduation and postgraduation success statistics, accreditation, and sales tactics.

## Collusion

Deception is not always be a solitary act. Instead, people may engage in a form of deception known as collusion, in which two or more individuals or entities collaborate to bring about mutual gain, often at the expense of others outside of the collusive relationship. The most well-known examples of collusion are found in the marketplace, when corporations agree to work together to rig prices or selectively share information. The practices of colluding companies foster monopolies and hinder an independent market system. But collusion is not limited to the marketplace. For instance, gamblers might collude to cheat and beat the house. Divorcing couples can collude to try to circumvent the red tape of the court system. Though collusive partnerships can be difficult to detect and punish, they stem from self-interest, which

undermines the cooperative effort needed to sustain them. As a result, collusive pacts are often unstable and fleeting.

Collusion can occur within and between organizations, involving agreements that are unspoken or overt. In explicit collusion, participating parties directly communicate with one another through a phone call, an in-person meeting, or in rare cases, a written document. For example, two vendors might explicitly discuss selling merchandise at a set price. In tacit collusions, parties achieve similarly effective agreements through indirect signaling. In this case, a vendor may set high prices under the assumption that colluding partners will match those prices, without discussion. The results of this type of price-fixing include higher profits for all when customers no longer have cheaper options. Both explicit and tacit forms of collusion occur within and between organizations.

Internal collusion involves parties within an organization defrauding the organization that houses them. For example, one employee might authorize false expense reports or grant unearned overtime pay for another employee. Internal collusive acts account for about 5 percent of frauds perpetrated within corporations. Organizations can also engage in external collusion to defraud one another. A seller may arrange a special rate with a supplier that his competitors do not receive, giving that seller an unfair market advantage. Moreover, internal and external collusion can simultaneously occur. For instance, Corporation A may bribe individuals within Corporation B for access to B's resources in order to take over B's share of the market.

In addition to its organizational forms, collusion can occur on interpersonal levels. Couples may collude in deceit to expedite divorce hearings when legal forums bar consensual divorce. For example, New York City in the 1930s experienced a spate of "soft-core adultery," in which men staged photos of themselves undressing with women that colluding couples used as evidence for divorce cases. Similarly, weary soldiers may engage in unspoken "live and let live" agreements. This type of collusion among enemy soldiers can result in unsanctioned cease-fires between trenches. High-stakes poker players may also collude to win big. Players may signal information

about others' cards in order to collectively raise or lower the bet and trap other players. Importantly, bluffing in poker is not collusion, because all players knowingly agree, expect, and accept that bluffing occurs as part of fair play. In true collusion, at both organizational and interpersonal levels, all but the colluding partners are unaware of any unscrupulous coordination.

### Collusion in the Marketplace

In economic terms, collusion is an agreement between would-be rivals to cooperate, in direct violation of market expectation that they compete. Such actions often result in a surge in profits for the parties involved, but destabilize the market as a whole. This potential for corporate gain, in spite of a broader cost, highlights the many examples of corporate collusion. In one of the most well-known collusion scandals of the 1970s, the aerospace manufacturer Lockheed Corporation allegedly gave \$12.6 million in bribes to middlemen and corporate executives in Japan in order to ensure the sale of their planes to a Japanese corporation. In the short term, this action increased profits for both Lockheed and its Japanese contacts. However, over time, Lockheed's collusive practices led to turmoil within the Japanese aerospace industry and created hesitancy to trade with the United States.

To understand the marketplace conditions that promote collusion, economists turn to game theory. Game theory posits that in a market of independent, competitive players, equilibrium depends on each player selecting the optimal, rational preference, given the likelihood of rival responses. In relationships incorporating tacit collusion, one player makes an economic decision and signals his partner to follow. While such collusion may produce optimal reward for both parties, tacit collusion reduces and at times eliminates the ability for third parties to make optimal decisions for themselves. Economists suggest that players, or colluding companies, need multiple "games" to solidify these tacit agreements.

Prolonged association between colluding companies is required to establish the terms of the arrangement, secure trust, and communicate information. If the terms of the collusive relationship are violated, traitors of collusive partnerships can be punished. This encourages the

loyalty of colluding parties, a necessary measure because of the fragility of collusive relationships. Once parties have engaged in collusion to corner a market, there is a strong incentive for them to then edge out their “partner,” who stands as the last remaining barrier to their exclusive individual control.

### **When Collusion Dissolves**

While the benefits of collusive partnerships may seem appealing, most collusive relationships fail. One frequently cited example of failed collusion involved a clandestine partnership between major electrical equipment manufacturers in the 1950s and 1960s. A handful of large companies, including Westinghouse and General Electric, met to set prices for machinery. They meted out portions of the sales market, agreeing that one partner would set prices lower than the others in certain regions, ensuring sales to the intended party. Competitors not involved in this agreement were shut out of the market in what journalists called the Great Price Conspiracy. In a major turn of events, General Electric dropped out of this explicit arrangement in 1954, starting a contentious free-for-all in the marketplace. All parties were forced to try to undersell one another, at unsustainably low rates. This left machinery prices depressed and destabilized the electrical equipment market for years. Despite an explicit collusive pact, the opportunity for individual companies to corner the market overwhelmed the desire to honor the collusive arrangement.

The dissolution of collusion fosters ill will among companies. American Major League Baseball (MLB) and the Japanese national baseball association (Nippon Professional Baseball) formed a tacit collusive pact. These organizations had a “gentlemen’s agreement” not to sign amateur players from each other’s nations, despite an international market that expected competitive recruitment. However, in 2008, MLB scouts recruited Junichi Tazawa, a pitcher from the Japanese amateur leagues. Japanese officials were outraged at the violation of their unspoken agreement. While some MLB managers acknowledged honoring the agreement, other clubs, such as the Boston Red Sox who signed Tazawa, did not. Like many examples of collusion, this gentlemen’s agreement degraded in the face of competitive

market forces. Especially when collusive agreements are tacit, no formal arrangement binds two parties together, increasing the ease with which such collusive partnerships can dissolve.

### **A Marker of Collusion**

Collusive agreements can be detected by the heightened consistency of the stories told by involved parties. Forensic research has found that there is much greater consistency in the stories of collusive pairs telling a shared lie than the consistency in the stories told by truth-telling duos. Truthful storytellers must reconstruct events from memory, which is a notoriously unreliable enterprise. Pairs of colluding liars must simply repeat an agreed-upon story. This contradicts the lay theory among law enforcement officers that inconsistency signals deception. Officers may instead treat undue consistency between individuals as indicative of collusive practices. Consistency may serve as a potential clue for detecting tacit collusive pacts.

### **Detection and Prevention of Collusion**

Collusion can be difficult to detect, but corporations or governments can utilize certain strategies to monitor such practices. For example, a corporation can watch for discrepancies in gross profits. Sudden drops in profits may signal fraud on the part of internal agents colluding with external parties by issuing prices that are too low. A company may also institute policies that prevent the likelihood of collusion. For example, policies occasionally rotating personnel duties or preventing gifts from vendors may prevent employees from establishing collusive partnerships with external agents. Governments create bodies to monitor and prevent collusion. In the United States, the Federal Trade Commission detects and investigates claims of corporate wrongdoing and begins the process of legal punishment and censure.

When corporations or governments detect collusion, they may find it difficult to legally prove that those collusive actions took place. To support an accusation of price rigging, for example, one would have to show that two or more entities fixed prices, engaged in a noncompetitive relationship, and that their actions negatively impacted the trade of others in their industry. An informant can often help make a case for collusion. This is

exactly what happened within the Archer Daniels Midland Company in the late 1990s. An informant aided the Justice Department in an investigation that uncovered price fixing among numerous agricultural producers. After prosecution, the Arthur Daniels Midland Company, a core member of the collusive agreement, paid \$100 million in fines—one of the largest fines in American history issued for this kind of corporate misconduct. This verdict was made possible by antitrust laws, which promote an open market by punishing actions, such as collusion, that interfere with competition.

### Conclusion

In an increasingly interconnected society, deception is becoming more social. Especially in economic contexts, in which increasingly more competitors are struggling to get ahead of the pack, it can be difficult to succeed or survive alone. Collusion can enable groups or corporations to cooperate in deception, often for great financial reward. However, collusive partners quickly turn on each other when the same selfish motives that united them drive them to seek a bigger portion of their ill-gotten profits.

## Colonialism

Colonialism is generally defined as extended rule over a foreign territory. Colonial rule had political, economic, religious, social, and cultural aspects. Widespread indigenous independence movements, beginning in the 1960s, broke apart Western colonial empires. Western-developed nations, however, continued to maintain economic control of developing nations, a phenomenon termed neocolonialism. Questions regarding colonialism's legitimacy and concerns over hypocrisy and dishonesty within the colonial system began to emerge alongside justifications of the practice. Critics of colonialism and neocolonialism cite the untrustworthiness of colonial powers, based on their history of dishonest behavior. They also cite colonialism's negative impacts, including military and political domination, economic exploitation, claims of racial and cultural superiority, forced assimilation, and sometimes genocide.

The practice of maintaining colonies has existed since ancient times, but colonialism is most often associated with European control of American, Australian, Asian, African, and other overseas territories from the 15th to 20th centuries. Advances in navigation were a key factor in facilitating this wave of colonization. Great Britain administered the largest colonial system, with the British Empire encompassing India and portions of Africa, the Americas, and the Caribbean. Colonial experiences differed based on each individual colonized nation's unique resources and conditions, as well as the motives of the colonizers.

Scholars further divide colonialism into settler versus exploitation colonialism. Settler colonialism is defined as control over a foreign territory for the purpose of widespread permanent settlement by emigrants from the home country. Examples include North America, Brazil, and Australia and New Zealand. Exploitation colonialism involves control of a foreign land with no plans for large-scale settlement. Examples include European colonialism in Africa. Exploitation colonialism is more associated with a dominant nation seeking to impose its culture on subordinate peoples.

Local government bodies provided daily local rule over settler colonial states, and members of the indigenous population held political offices under exploitation colonialism, but the colonial

*Hernán Cortés and his men kneel before Emperor Montezuma in an illustration in Frank Leslie's Popular Monthly, Volume 6, 1878. Some scholars assert that Cortés was able to conquer the Aztecs of Mexico by leveraging their belief that his arrival equaled the expected return of their god, Quetzalcoatl.*

country maintained ultimate sovereign political control in both cases. Critics argued that this practice provided a false illusion of settler or indigenous participation in their colonization, or that those indigenous figures in power hid ulterior motives of self-interest within the guise of helping their people. Trouble often arose when settlers felt that home governments were suppressing their local interests, such as occurred in the American Revolution against British rule.

### Justifications and Criticisms

A variety of justifications for colonialism have been posited throughout history, although widespread theoretical justification for colonialism emerged in the more modern period. These justifications have included national and individual

prestige, the natural dominance of the strong over the weak, economic benefits, beliefs in a progressive view of history and its accompanying motive to spread civilization, and the missionary impulse. Critics of colonialism often state that these justifications for modern colonialism, especially those claiming the best interest of the colonized as their primary motivation, are backed by either hypocrisy or self-deception.

Older colonizing nations and military conquerors did not find it as necessary to justify their actions in a theoretical context, although there were a few early critics of colonialism. Overt motives such as curiosity, the desire to explore, the search for better trade routes, military ability, or perceived economic benefits such as the lure of gold, silver, and luxury items drove early colonization. Colonies and their resources were the naturally justified benefit of such explorations. As some critics and philosophers began to question the negative or hypocritical aspects of colonialism, more theoretical justifications began to arise.

One of the most cited theoretical justifications for colonization was the concept of the “white man’s burden.” This theory posited that the dominant developed nations, believed to be the most civilized, had a duty to spread civilization to developing nations. Developed nations viewed these developing nations as farther back in the progressive historical evolution of societies, from savage to barbarous to civilized. Through their control, developed nations would act as guardians and teachers until the developing nation was prepared for self-sufficiency. Beliefs in racial and cultural superiority also played a role in this rationalization of the movement to spread civilization.

Proponents of colonialism argued that it served the interests of the developing nation’s peoples as well as global interests and not just the interests of the dominant nation. Critics, on the other hand, argued that justifications of colonialism based on civilizing and missionary impulses were either a deceptive front hiding more self-serving political and economic motives or a self-delusion held by exploiters who were sincere but misguided in their stated motives. Colonizers were accused of downplaying or hiding motives of personal gain and national glory behind the guise of providing aid to the colonized.

Critics maintained that the relationship between colonizer and colonized was less the purported student–teacher relationship and more of a patronizing, paternal relationship. Colonialism in the name of guiding the development of indigenous populations was often accompanied by such antithetical actions as enslavement, genocide, warfare, and forced assimilation to the dominant culture and religion. Critics also pointed out the outright deception involved in colonialism. Indigenous peoples were often deceived into surrendering land through swindles, land deals with bad terms, or treaties that were not honored.

Religious motives provided another key justification for the military conquest of lands viewed as controlled or inhabited by lost souls in need of salvation since the time of the Crusades. Many colonizers and their supporters truly believed that Christianity was the one true religion, and paganism, Islam, or other forms of religion were akin to savagery, idolatry, and devil worship. Missionary colonialists also justified their actions by stating that peoples such as the Native Americans were violating natural law, thereby abrogating their rights to independence and self-rule through a demonstration of their inability at this point in their cultural evolution to act with reason. Commonly cited examples of such behaviors included polygamy, cannibalism, and nakedness.

Religious motivations also served to hide the desire for personal wealth or to justify a nation's political and economic exploitation of another people because religious control often extended into political, economic, and cultural control. Hypocrisy within the missionary impulse included the emphasis on labor exploitation and land, natural resource, or wealth appropriation while religious training and conversions remained secondary. Religious deception aided colonization in other ways. Some scholars believe that Hernán Cortés was able to conquer the Aztecs of Mexico through the widely held Aztec belief that Cortés's arrival equaled the expected return of the Aztec god Quetzalcoatl.

Spanish colonial missionary efforts in the Americas sparked lengthy debates as to their legitimacy and the truth behind their religious motives. The Spanish conquistadors of the 15th through 17th centuries cited religious conversion of the New World's indigenous peoples as

a primary justification for colonization. Early explorers such as Hernando de Soto, however, viewed the Native Americans as obstacles or potential sources of wealth, rather than converts. Later scholars note the irony that the desire to civilize and convert indigenous peoples for the advancement of their societies instead resulted in widespread population loss, warfare, and enslavement or other forms of economic exploitation.

One of the most well-known and influential of the early critics of religious colonial practices was the Spanish priest Bartolomé de Las Casas. Las Casas was active at the time when Europeans were debating whether Native Americans had souls, considered a crucial question to religious motives for colonization. The passage of the New Laws of 1542, which declared that Native Americans had souls that could be saved, placed a greater emphasis on religious motives. Las Casas remained critical of Spanish colonial practices because of their harsh treatment of these Native souls for which they claimed to seek salvation.

Philosophers, political theorists, and religious leaders have also struggled with the issues raised by colonialism. The 17th through the 19th centuries saw the rise of movements such as the Enlightenment that emphasized universal natural laws and human rights, uncomfortably juxtaposing beliefs in the universal human capacity for reason, equality, cultural pluralism, and self-determination with colonialism and its assumptions of racial and cultural superiority and domination over the “uncivilized.” Scholars began to question whether European colonial powers had the right to dominate other countries or force other cultures to abandon practices that they found alien or in violation of natural law.

The Enlightenment, active in the late 17th and 18th centuries, emphasized universal human reason, the natural development of human cultural pluralism, and the capacity of all peoples for self-government. These beliefs came into conflict with colonial practices such as enslavement, economic exploitation, property and wealth expropriation, and forced assimilation. Thus, questions of hypocrisy and deception played a central role in Enlightenment debates as to the legitimacy of colonialism and the civilizing impulse. Key Enlightenment philosophers such as Immanuel Kant and Denis Diderot offered scholarly critiques of colonialism.

Other scholarly critics of colonialism included Edmund Burke, John Stuart Mill, and Alexis de Tocqueville. Mill highlighted the inherent difficulties in colonial rule, including lack of adequate local knowledge and the natural tendency to favor one's cultural background and those who share one's cultural beliefs. De Tocqueville believed that the one-sided dialectical relationship between colonial settlers and indigenous populations could never be resolved as civilizing justifications claimed. Scholarly defenders of colonialism countered that indigenous peoples were simply not far enough along on the scale of civilization to be ready for self-determination.

### **Modern Decolonization and Neocolonialism**

Western imperialism and colonization began to decline after their height in the late 19th and early 20th centuries. A wave of anticolonial sentiment and national independence movements rose in the post–World War II period. Independence movements were aided by the foundation of the United Nations, which played an active role in decolonization. Its founding charter called for the independence or self-government of all peoples still under colonial rule, and international oversight of all areas that did not yet meet those goals. Some called for an immediate end to all colonial rule, while others argued for a transitory period in which independence would be slowly ushered in.

The spread of free trade, as well as growing criticisms of colonialism, imperialism, and racism aided the end of widespread colonialism. Modern critics of colonialism pointed to its continued impacts after decolonization, mainly through the legacy of the centuries of colonialism that preceded independence, as well as the subsequent ongoing economic dependency of many former colonial nations. Many countries began to view their colonial past in a less positive manner as previous justifications were increasingly criticized as either outright deceptions or self-deceptions. Lasting impacts of colonialism include inequality, political instability and violence, oppression, and widespread poverty, as well as a lack of economic development, effective medical care or education, adequate sanitation, and other necessities.

Although widespread colonialism ended by the late 20th century, former colonial powers continued to exert influence over the developing world.

The older justification of aiding a country that is not yet prepared for full independence remained a justification for new forms of neocolonial aid that emerged in the late 20th and early 21st centuries. These include economic and political controls such as foreign capital, foreign aid, preferential trading relationships, and training programs. Critics claim that Western nations now use economic development, rather than direct political or military domination, to maintain control, resulting in continued economic exploitation in the name of modernization and the global economy.

This phenomenon is commonly known as neocolonialism. Neocolonialism posits that independence is simply a deception, allowing former imperial countries to maintain economic and political control of their former colonies. They also cite the negative self-serving aspects of neocolonialism, such as the use of developing nations as new markets and sources of cheap labor for transnational corporations. Others point to ongoing military or political control, citing examples such as the United States' involvement in Iraq and Afghanistan. Critics call for increased international oversight through organizations such as the United Nations, citing the past history of deception as proof of the untrustworthiness of former colonial powers.

Modern interest in the study of indigenous experiences of colonization highlights the differences in worldviews that affected colonial relations between colonial and colonized populations. These differences in worldviews among the colonizers and the colonized included different beliefs concerning deception. Studies have shown that the colonized utilized these differences in worldviews as they adapted to colonization. Lying and deception were employed as a strategy of survival in the intercultural encounters engendered by colonialism.

For example, scholars have explored such differences in worldviews concerning truthfulness among Native Americans and their European colonizers. Both Euro-American cultures and their Native American counterparts held religious and cultural worldviews that disapproved of the practice of lying, but differed in their beliefs with regard to motivation and punishment. Native American worldviews held that people lied out of insanity, a true inability to distinguish reality, versus outright dishonesty. Liars were usually

pitied, rather than punished. Euro-Americans, on the other hand, traditionally viewed lying and deception through a religious framework, declaring it a sin. The dishonest operated out of self-interest and were shunned or otherwise harshly punished.

Colonized people adopted numerous survival strategies, including lying and deception. Indigenous peoples who believed their colonizers to be liars or hypocrites employed deceptive practices. European accounts of interactions with Native Americans describe numerous situations in which Native American groups who encountered European explorers seeking material wealth sent them on their way by describing a wealthier Native American settlement somewhere in the distance. The enslaved often deliberately slowed down their work or broke tools, feigned illness, and held secret meetings to plot rebellion.

Postcolonial theory emerged in the academic world in the late 20th century, especially within the fields of literature and the humanities. Postcolonialism explores the power of language to either aid in colonial subjugation or to allow indigenous populations to directly speak to the perceived truth of their experiences. Postcolonial theory focuses on the use of history and literature to justify the colonial legacy and forces of neocolonialism, and to downplay or hide their negative aspects. It also explores the colonial expropriation of indigenous cultures, which can give a distorted picture of such cultures as viewed through the interpretive lens of another culture.

## Columbus, Christopher

The juxtaposition of Christopher Columbus's name with lying and deception is ambivalent. The focus can be on the lies that have been told about Columbus, or on the lies that Columbus told. Among the many untruths written in history books is that of Columbus as the discoverer of America, and not even Columbus, who turned out to be quite a deceptive figure, even dreamed of playing that role. In fact, the lies that Columbus told are much more interesting and still warrant careful examination.

Initially, there appeared to be a wholesome effort at truthfulness. Christopher Columbus had succeeded at selling his project to the Spanish Crown, finding a more direct route to the Indies, and finding gold. A journal would be kept of this voyage. Thus, it is with the verb "to write" that Columbus refers in the journal to his expedition: "... I thought of writing on this whole voyage, all that I would do and see and experience ..."

Admiral Columbus needed to write about this journey, for the journey could not be justified without the writing, and the writing was there to make up for the absence of the sovereigns of Spain who had funded the journey. Queen Isabella and King Ferdinand needed to be convinced that their money was well spent. The act of writing in the journal was therefore tied to an effort to gain and share knowledge and understanding of what lay beyond the rim of

the horizon, to unveil the ocean's secret, which was an unrecognizable object, the New World. Soon enough, truthfulness and accuracy would become impossibilities.

### The Need to Lie

Uncertainty led to a need for two journals: one that told the truth, and one that veiled reality. The crew needed to go about daily life onboard, goaded by the promise of future wealth and perhaps even renown. Any intimation that this enterprise could perhaps fail, any hint that they could possibly be navigating toward their doom, had to be quickly crushed. Hence, the lies: The number of knots traveled was rethought every night so that the crew would continue believing that land lay ahead, and that they had not traveled that far without reaching land. As the days passed, the more urgent it became to reassure the crew that they had not traveled that far. This initial, internal deception explains the difficulties in determining for sure where Columbus first made landfall.

Time and circumstance have given many dimensions to Columbus's journal that can be approached as a diary, a letter or the rough draft to a letter, a journal, and, once it was transcribed by Bartolomé de Las Casas, as a diary, a letter, and a journal written in different persons. In the beginning, the text is in the first person, but soon the "I" becomes "he," and remains that way until October 13. Moreover, having "he/that" alternating with the "I" not only is an attempt to put words to the landscape but also talks to them (the sovereigns) and tries to justify this landscape.

Granted, this text is not literature. However, it can be approached as a literary text, not so much because of its intention to be literary, but for the epistemological change that it originated by its gaze, for its effort to find words for an unknown and incomprehensible world, and even for the liberty that this gaze takes with the first-, second-, and third-person singular—regardless of the fact that this liberty is accidental. In other words, the text written by Columbus could very well have meant to be honest in the beginning, as did the text written by Las Casas. However, the literary happened, and at times the "I" and the "he" are so intertwined that they share the same sentence (written on December 21, 1492). In fact, the

journal can be considered a lie because the original journal was never found; all that is left is a text written by Las Casas.

### Inventing a New Language and a New World

So Columbus proceeded, from Friday, August 3, 1492, to write down ". . . each night whatever I experience during the day and each day what I sail during the night . . ." The act of writing (much like the act of naming) also has everything to do with taking possession. From the day the crew made landfall, this unknown world, so full of water and so very green, was there for the naming, writing, and taking. Therefore, from the moment the admiral and his crew spotted the first signs of land, there was need for a new language. However, as described by author Walter Mignolo, to invent a new language means running a risk. His observations in *Historia de la Literatura Hispanoamericana* can be translated as, "To invent a new language when the recipient of the message has not seen the object amounts to producing an unintelligible discourse." This haste to name and take possession, in turn, paved the way for further deception.

On Thursday, October 11, the crew saw sandpipers, a green branch, a cane, a stick, another small stick, a small branch, vegetation that grows on land, and a small branch covered with vegetation. At this early juncture, there is a certain monotony in the discourse, mostly because of the repetitive use of nouns and adjectives such as stick, small stick, branch, small branch, green reed, and brown cane, and therefore there is less effort at hyperbole. In fact, it would appear that the admiral is at a loss for words. These remain, however, the first words used to announce what lay ahead—the American landscape.

The Americas did not yet exist, but they needed to be described, so a language had to be invented in order to describe them. Although Las Casas transcribes the lost journal with hindsight, on October 11, 1492, the objective was to discover a new route to the Indies, not a new world. At that point, the brown sticks and the green reeds were merely harbingers of Cipangu. Oddly enough, Columbus had no qualms about renaming these islands that had to be of the Indies because they were exactly where the Indies should be. Tzvetan

Todorov believes that this approach gives insight into the admiral's character and manner of knowing and gazing at the world. According to Todorov, Columbus has none of the qualities of a modern empiricist because the decisive argument does not come from experience. Columbus knows beforehand what he will find and real life experience is not to be questioned, it serves only to illustrate the truth.

At 2:00 A.M. on October 12, Rodrigo de Triana, who was on the lookout on the *Pinta's* fore-castle, saw something that resembled a dark line of land in the moonlight and shouted, "¡Tierra! ¡Tierra!" Early that same morning, the famous landing often depicted by artists without much respect for the actual topography took place. The admiral and his crew set foot on a small island of the Lucayos that the natives referred to as Guanahaní, what is present-day San Salvador, or Watling's Island.

When they set foot on Guanahaní, they saw naked people living in a state of nature. According to Samuel Eliot Morison, the virtuous savage myth began precisely with the Taínos on Guanahaní, which means iguana, a reptile now extinct on Guanahaní.

### Deciphering an Unknown World

Critic Anderson Imbert writes that Columbus did not have a direct vision of America, but rather a reflection, much like clouds reflected on the surface of a quiet lake. For most of the first voyage, the gaze is not yet turned toward the Americas; it is either turned inward (toward the conviction that these are the outer islands of Cipangu), or it is turned back toward Europe, and it is using the words or elements from medieval literary tradition to describe the landscape. These elements are few and invariable: trees, water, air, birds. They are used time and again to describe a pastoral scene, or the Garden of Eden.

Mignolo explains that knowledge is not only extracted from an object, it is also the result of what one knows before taking the object into consideration. The admiral and his men landed with all their cognitive baggage; they saw, interpreted, named, and took possession of the new world before them.

For the first time, the Europeans were attempting to decipher this new geographic dimension,

an unknown natural world. It is so new that their cognitive abilities cannot yet recognize it as new; they are literally stunned. The place that they are beholding for the first time has to be given either old names, such as the Indies, Cipangu, or the land of the Great Khan, or new names, such as Isabella, San Salvador, and Fernandina. As to the available adjectives to describe this world, they are scarce, and they lack local color.

### Conclusion

The journal was a "dress rehearsal" for the letter that the admiral later wrote to the Spanish Crown on his way back from this first voyage in an effort to convince the monarchs that the expedition they had funded had been a total success; that they had not wasted their money, but on the contrary, that they should fund a second voyage because there was no time to waste in this harried search for an alternate route to the Indies, for gold and alternate sources of wealth. By simply stating that it was a pleasure to gaze upon the greenness of the island, the admiral was already attempting to "sell" the place to Ferdinand and Isabella. Obviously, selling could very well require lies and deception.

## Communication

The word *communication* comes from the Latin word *communicare*, which means to impart, share, and make common. In its original use, communication referred to concrete social practices, such as the sharing of gifts or duties. However, in the last two centuries the word has been used to describe increasingly more abstract phenomena. Especially in contemporary Western thought, communication has become a powerful and rich metaphor utilized to account for several aspects of social reality, such as the creation of meaning, social learning, the emerging of social relations, the constitution of social groups, and the functioning of social systems.

The simplest and most minimalist way to define communication is to describe the activity of conveying information through the exchange

of thoughts or messages between individuals. However, even such a concise definition does not completely gain consent in the field. In fact, beneath distinct definitions of communication stand competing theorizations of knowledge and society. It is a political and ideological matter but is also a question of development of the academic discipline. The field of communication lacks consolidation to the extent that J. A. Anderson was able to identify hundreds of distinct definitions in a handful of textbooks. One of the reasons for this disunity was that, prior to the academic recognition of communication as a discipline, multiple definitions of communication independently arose from distinct fields, such as mathematics, philosophy, sociology, political science, and psychology. The complexity in defining communication also explains the complexity of the word's relation to deception.

### Deceptive Communication: Seven Primary Ways to Approach It

According to Robert T. Craig, communication as a proper field does not exist. Instead, one can identify several different domains, seven main theoretical traditions of communication, such as rhetoric, semiotics, phenomenology, cybernetics, sociopsychological, sociocultural, and critical. Each one, according to its ontological and epistemological assumptions, implies a different approach to deception.

According to the rhetorical tradition, communication consists of practical discursive persuasion; in other words, communication aims at finding an ideal identification between the position of the speaker and his or her audience. From a practical rhetorical perspective, which evaluates communicative practices based only on their rhetorical effectiveness, without contemplating morality or the content of the particular values conveyed by the rhetorical act, lying and deception may lose their traditionally negative connotations. In fact, such a point of view may potentially celebrate lying and deception as rhetorical performances in the framework of successful strategic communication.

Furthermore, rhetoric regards authentic communication and the idea of truth as dangerous myths that have favored the universalization of specific social group interests in the form of

The April 16, 1892, cover of the French Social Party publication *Le Petit Journal* illustrates the arrest of French anarchist and assassin Ravachol. Media have profound negative impact on societies by increasing social conflict and confrontations between different ideologies; this is the essence of propaganda, or the use of communication to propagate specific beliefs and expectations.

ideologies. This especially applies to the recently emerged field of critical rhetoric, which contextualizes language in a framework of production, reproduction, and contestation of power. Under such a perspective, deceptive communication should be countered by the ideology-critique capabilities of rhetoric to use the knowledge of the techniques of effective communication that are used by deceptive communication against itself to uncover it.

According to semiotics, communication is defined as social mediation taking place through signs. Especially under the influence of poststructuralist tradition, semiotics could be considered

the science that studies how language deceives because it celebrates the nonidentity, the ambiguousness of language, or what Jacques Derrida defines as *différance*. Whereas the act of lying and deceptive communication consistently implies the intentionality of the subject who falsifies and manipulates reality, semiotics points out the inherently deceptive nature of language, thus introducing an impersonal dimension to it. For instance, even though intentional deception increases the distance between the constitutive elements of a given sign, a signifier (sound, object, image, or the like), and a signified (concept), such a distance, according to semiotics, is always present because it is inherent in language.

Semiotics assumes that language is deceiving because it is founded on the arbitrariness of the link present in the very sign between signified and signifier. For instance, the difference between the denotation of a phrase such as “thank you,” with its literal expression of gratitude, may differ from or deceive a much more specific connotative and cultural meaning, or a meaning dependent on specific context. Consequently, the same expression of gratitude, “thank you,” during a quarrel may be deceiving because of its actual sarcastic and reproaching intention.

### Phenomenology and Cybernetics

According to phenomenology, communication consists of the experience of otherness and tends to privilege the establishment of social relations and the authenticity of such relationships. Consequently, deception and lying are negatively regarded as hijacking communication from such genuineness and openness. Deception negates the normative base of the phenomenological tradition, which results in an overt negation of the objectives of such tradition because it undermines the aspiration to establish a common ground among subjects.

Phenomenology may frame deception within the perspective of an artificial Cartesian separation of body and mind. In fact, according to Craig, communication begins with the prereflective experience arising from “our bodily existence,” deception as reflective, strategic behavior par excellence, and separates the worldly relations with a mediation of consciousness. In doing that, it deifies the possibility of dialogue and instead

paves the way for the establishment of instrumental and dominating relations with others.

Cybernetics, arguably, has substantially contributed to the modern and dominant understanding of communication as information processing. According to cybernetics, communication should consist of a transmission and elaboration of information in a system. Communication for cybernetics is the most powerful metaphor and description to address functional interrelationships of a system. The success of communication consists of extracting meaning from the conversation so that the subjects involved can move the conversation in the right direction, according to their goals. Lying and deception could be potentially regarded as neutral instances of the passage of information.

For instance, by only considering as relevant the objectives of the lying subject, as long as the given lie or deceptive behavior does not interrupt the flow of communication or create noise, cybernetics in principle would not approach deception in a different way than any other communication mode. In the same way, by only considering the objective of a given system, cybernetics could relativize the general negative connotations of deception because communication is almost exclusively evaluated for its function within a given system. Cybernetics tends to overlook the problem of sincerity, arguing that there must be more effective ways to establish the reliability of information. In such a practical view, the typical phenomenological issues regarding authenticity and immediateness are discarded.

### **Other Approaches to Lying and Deception**

According to the sociopsychological approach, communication influences, affects, and reflects personality and behavior. Communication constitutes the dimension in which individuals interact and influence each other, and therefore is considered a fundamental social mediation. However, the main mediating ground of communication is not based on signs (semiotics) or bodily experience (phenomenology), but on psychological predispositions. In the context of such an interaction, lying and deception may be approached as an outcome of both emotions and the rationality of subjects. Thus, deceptive communication could be at the same time strategic and nonstrategic.

Such a tradition, historically involved in the study of mediated propaganda, could also approach lying and deception as effective strategies of psychological manipulation. Lying and deception could then be used both for particularistic communication, as in the case of the psychological leverage frequently produced by advertising, and as public communication to reach collective and common goals.

According to the sociocultural approach, communication is a symbolic process that produces and reproduces the social order through social interaction. Lying and deception could be regarded as potentially disruptive factors of the social order and equilibrium; but also, from a strictly functionalist perspective, lying and deception could be seen as necessary illusions to create consent. According to J. W. Carey and his ritual model of communication, by allowing the exchange of information, communication produces and reinforces communities. The sociocultural approach seems more preoccupied with the lack of social coordination because of the lack of shared rituals and sense of community than with authentic communication.

Finally, the critical approach to communication looks at communication in self-reflective ways and how it produces and reproduces power in ways similar to the critical rhetoric perspective. Lying and deception could be regarded as means to reproduce such power by disseminating false ideologies and oppression, limiting consciousness, and contributing to create a misleading image and understanding of social reality. According to the classical Marxist branch inside this tradition, ideology consists in lying and deception that prevent people from understanding the real nature of social reality. According to Michel Foucault, communication is the mechanism by which power is exerted, while for Louis Althusser, through communication, power “interpellates” people.

Like the phenomenological tradition, the critical approach tends to assume the existence of a more authentic level of communication (relatively) emancipated from power and particularistic interests. Performing an ideological critique, the critical tradition also finds deception in the alleged neutrality of science, and more generally in social institutions. The critical tradition assumes

that self-reflection can liberate social reality from lies. It is also worth mentioning that such a tradition has been criticized by postmodern thought because it is based on noncritical assumptions defined as grand narratives, which in the end, could be defined as self-deceiving instances of communication.

In sum, according to specific definitions of communication with their equally specific assumptions, lying and deception are evaluated differently. When the effectiveness of communication is privileged, as in the case of rhetoric's persuasive communication and cybernetics's effective information flow, lying and deception are potentially seen as neutral. Conversely, when communication is evaluated in its capability to both mystify and demystify reality, as in the critical approaches, then lying and deception assume negative connotations because they support the power to falsify reality for the particular objectives of a given social group.

### Detecting Deceptive Communication

The detection of deceptive communication was not only a concern of the critical tradition but also of scholars who intended to find scientific ways to detect lies. Deception theory studies deceptive communication, strategies to detect deception, and the strategic communication for deceivers to recover from deception detection. Several experiments have been conducted to detect deceptive communication. These studies consistently point to the difficulty in finding a reliable method to distinguish truthful communication from lies. According to Judee Burgoon, deception may be detected two-thirds of the times by experts. Despite the fact that deception detection in communication studies has been explored by thinkers such as Aristotle, Saint Augustine, Niccolò Machiavelli, Immanuel Kant, and Sigmund Freud, it never really developed into a subject matter in its own right, which is possibly linked to the subject of deception detection.

There have been several attempts to develop tools to detect lies: the control question, the polygraph, the cognitive polygraph, electroencephalography, eye-tracking, voice analysis, and nonverbal behavior. Burgoon argues that communicators may identify deceivers by detecting certain behavioral features that allegedly are

consistently present in deceiving communications. She has noted how "deceivers exhibit an overall communication style that is less involved, immediate, and cooperative, and more uncertain, tense, and nervous," verbally, the messages of liars are less forthcoming in that they are "shorter, lack content details, are less logical and plausible, have fewer spontaneous corrections or admissions of poor memory, and contain more discrepancies." She also maintains that the voices of deceivers are "higher-pitched with more repetition-style dysfluencies," and that, "Kinesically, their pupils dilate more, they are less pleasant facially, they use fewer illustrator gestures, and they exhibit more fidgeting and adaptor behaviors such as pressed lips."

The typical study of deception detection consists of having subjects try to distinguish a series of truths from lies. T. R. Levine argues that in these experiments, the accuracy is slightly better than chance. The polygraph is the most reliable way to detect deception, and such a technology improves lie detection, but some scientists argue that polygraph results are unreliable.

### Instances of Deceptive Communication

The relationship between communication and lying and deception does not only depend on dissimilar definitions of the former, but also on the level in which communication is approached. For instance, through the lens of intercultural communication—the subfield of communication dedicated to the study of communicative context formed by individuals from different cultural/religious/social contexts—lying and deception could be relativized as miscommunication and misinformation. Even what could be considered an unvaried element, such as the deceptive intention of the speaker, an intercultural communication perspective could problematize as a homogenous, universal understanding of such an intention.

Another instance in which lying and deception assume a particular meaning is communication understood as dramaturgical action, a form of strategic interpersonal behavior. In Erving Goffman's *The Presentation of the Self in Everyday Life* (1959), the sociologist argues that when individuals are engaged in social interactions, they will attempt to control or manage the impression that others might make of them by modulating their appearances and manners in order to present

themselves in particular ways and to avoid embarrassing situations. From such a perspective, relocating the dramaturgical stage outside the theater, the playing of social actors may involve lying and deceptive communication. In fact for Goffman, social actors play differently in the “front stage,” the public sphere in which performative communication is enacted in front of their audience, and “back stage,” the private sphere in which individuals can more genuinely act without the pressure of social identities.

From the dramaturgical perspective, the “moral” agency of individuals involved in deceptive behavior must be placed in a context of intense social pressures. On the one hand, the social actor has the ability to play his or her specific performance on his or her stage. On the other hand, Goffman recognizes the existence of structural pressures and boundaries that contribute to substantially determine such a performance and its degree of necessity in order to allow individuals to be sufficiently socially integrated. However, the social context does not only exert pressure, but also contributes to the reproduction of deceptive behavior. When, for instance, the impression management of a given social actor fails, his or her audience may pretend to have seen the fumble in the situation as profitable for them. This is a situation in which the deception is collectively experienced and constructed.

In the picture described by Goffman, deceptive communication becomes both an aspect of individual agency and an aspect of impersonal structural pressures because actors strategically shape their social environment as much as they are shaped by somebody else, and they are pushed to reproduce untruthful acting. Furthermore, according to Goffman, the “generalized other,” the ubiquitous judging social eye, sometimes is so much internalized that impression management strategies can even be employed in front of an imaginary audience, therefore pushing the front stage into the private sphere.

At an interpersonal level, as the examples already mentioned show, deceptive communication is not necessarily characterized in negative terms; instead, it seems to be the result of the intersection of the strategic attitudes of individuals and social contingencies. On the contrary, in the field of mediated communication, lying and

deception have almost consistently been seen as collective pressing issues. This is evident in two examples: propaganda studies and journalism studies.

### **Propaganda and Journalism**

Deception and lying enter at the heart of communication studies as materialized in concerns about propaganda. Since the introduction of the first means of mass communication, the press, followed by radio and television, the media were believed to have a profound negative impact on societies by increasing social conflict and confrontations between different ideologies. A term that summarized such concerns about the disruptive potential of media was “propaganda,” or the use of communication to propagate specific beliefs and expectations. In fact, early communication theorists were convinced that an undedicated mass audience was not able to resist the manipulative force of propaganda.

The dissemination of particular beliefs from a particular subject such as a political party is not in itself negative. In fact, within the category of propaganda, one can distinguish between what was considered as positive “white propaganda,” and the more negative “gray propaganda” and “black propaganda.” White propaganda implies the intentional suppression of potentially harmful information, or the deliberate promotion of positive information and ideas. This form of propaganda implies that a degree of deception was considered to be positive overall. In contrast, gray propaganda is the dissemination of ambiguous information, which could be false or true, and in which no effort is made to determine its validity. Black propaganda is the deliberate strategic dissemination of lies.

The subjects perpetrating propaganda could be private citizens or public institutions. On the one hand, individuals could be involved in political campaigns, or advertising or denigrating products for economic purposes. On the other hand, in societies in which the collective action was no longer determined solely by the will of the monarch or a purely coercive power, governments realized that in order to effectively function, they needed a level of popular consent. For example, when the nation needed to mobilize for war, deceptive communication could produce and reinforce hatred for the enemy.

For propaganda theorists such as Walter Lippmann and Harold Lasswell, propaganda was necessary to selectively inform the public, manufacture consent, promote democratic symbols, and fight “enemy” propaganda. Public relations specialist Edward Bernays considered the use of public relations as the attempt to engineer public support for an activity, cause, movement, or institution. However, contrary to Lippmann, Bernays did not consider the public so easily manipulable. For this reason, public relations had to be conceived as holistic campaigns. Furthermore, Bernays accentuated the neutral value of public relations, compared to the negative value of propaganda, because public relations could be employed to take care of public economic subjects, such as big companies or corporations.

The media, whether publicly or privately owned and controlled, are considered to provide a public service, and for this reason, media propaganda has tended to be characterized in negative terms. In contrast, the propaganda found in advertising and public relations predominantly looks at lying and deception from a pragmatic point of view, seeing it as strategic communication. The mediated communication provided by the media can also be conceptualized in highly normative terms as institutions of the so-called public sphere.

According to Jürgen Habermas, the public sphere is an area of social life in which individuals come together to freely discuss and identify matters of mutual interest, ideally in which public opinion is formed and the government’s activity is put under scrutiny. In this sense, the term *public sphere* describes a form of democratic power that, through the idea of publicity—placing something under public scrutiny—directly challenges the ancient regime exemplified by the notion of *arcana imperii*, or government secrecy. Therefore, media are fundamental agents of public-ness, ideally conceptualized as democratic tools that deify the government’s machinations and attempts at deception.

*Arcana imperii* describes a power that operates in the private sphere—secret policymaking—in which the government can potentially operate by deception. At the same time as the emergence of the modern press in the Enlightenment period, such a model of power lost its moral and social justification because of the development of the idea of public use of reason. Immanuel Kant was

one of the most important theorists of the public use of reason and the way that lies and deception harm society. Truth then becomes an unconditional, universal duty.

The modern conception of journalism derives from such a normative conceptualization of communication as a democratic resource. In fact, journalism ethics as a subset of a media professional code represents one of the communication practices that most explicitly disapproves of and rejects deceptive communication. As a matter of fact, some of the most important elements of this code are truthfulness, accuracy, objectivity, impartiality, fairness, and public accountability. The professional ethical code of journalism understands media as collective resources that make everybody socially, politically, and morally accountable.

However, communication, lying, and deception within the frame of journalism produce important tensions. On the one hand, journalism explicitly rejects lies and deception because, according to libertarian theory (as set forth in John Milton’s *Areopagitica*), truth and liberty are strongly linked, and only in a free, open debate will truth triumph. On the other hand, a theory founded on the absolute value of liberty negates in principle the freedom to lie and deceive, even when such deception is necessary to avoid major negative repercussions.

In the contemporary debate about journalism, another tension emerges when one considers the activity of the media from the political and economic point of view. As soon as information and communication in general becomes a commodity, its social value as a commonwealth is relativized and becomes more the value of particular interests as way to accumulate capital. Thus, commodification, concentration of ownership, vertical integration, and conglomeration may potentially prevent the triumph of truth because the media become subject to the marketplace, and the principles of the marketplace do not necessarily follow truth.

## Conclusion

Because of an inherently communicative element present in both lying and deceptive behavior, communication provides a powerful point of view to understand these phenomena. However, communication studies have failed to establish a subfield

dedicated to such practices. One possible reason for this can be found in the inconsistency of data about lying: whereas J. F. George and A. Robb report that lying and deception have been estimated to be present in 25 to 33 percent of all conversations, K. B. Serota and colleagues claim that most lies are produced by only a few prolific liars. A second reason for such a lacuna is the fact that communication, like many disciplines, contains a highly normative charge, and such a charge most frequently treats lying and deception as malfunction, degeneration, impediments, or even explicit negations of communication.

## Computer-Generated Images

Computers are powerful tools for the display of images. They have also been used to manipulate and manufacture images through the use of graphic applications. These computer-generated images (CGIs) can then be used in many different areas such as art, printed media and advertisements, movies, television programming and commercials, simulators, and video games.

### "Photoshopping," Motion Pictures, and Virtual Worlds

Programmers have developed graphics software for computer-generated images, many of which are relatively inexpensive for the production of artwork, games, and other works on personal computers. For individuals and graphic design studios, software packages include Photoshop, Art of Illusion, Blender, POV Ray, Clamix Modeler, Genesis 3D editor, and Z Modeler. Changes made to photographs are called "photoshopping" or, in earlier times, "airbrushing." Graphic images are altered in order to deceptively create the illusion that what is seen is the actual original photograph. When viewed on the Internet, these images are difficult for most people to detect as alterations.

More complex packages are expensive and are used to produce full-length animated or special-effects motion pictures. For example, graphic special-effects imagery studios such as Pixar use complex programs and professional "plug-ins" to create animated movies. The 3D imagery generated by these computers are in some ways similar

to the imagery produced by the traditional methods of Walt Disney Studios and other firms that produced cartoon films. Disney and other studios had armies of artists who drew picture after picture to produce the numerous frames that moved so rapidly that to the human eye, the pictures seemed to move.

Computer-generated images can be static or move dynamically. They can be flat, two-dimensional works, or generated in three-dimensional formats. Some motion picture releases, such as *Turbo* (2013), have been created in 3D format. These graphically animated films are a development from the first anaglyphic production in 1915 and later, the “golden era” of 3D movies of the 1950s, such as *Fort Ticonderoga* (1953). However, they have usually been treated as a novelty. Modern computer-generated images have advanced into new frontiers of visualization through special effects.

Commercial animated films are produced on rapidly advancing digital imaging products that are used from storyboard to shooting and editing films. There are two basic ways in which digital imaging is used. First, it can remove unwanted elements from each frame of a motion picture. The second use of CGI is to build images. For example, the feather in *Forrest Gump* (1994) that flutters by the steeple of the Independent Presbyterian Church in Savannah, Georgia, or the creation of herds of dinosaurs in *Jurassic Park* (1993). Today’s filmmakers no longer need vast collections of miniature models for filming battle scenes or other events.

Computer-generated animations may also create virtual worlds. Like motion pictures in general, they are the makers of illusions, such as creating the illusion that the viewer is seeing motion. It also draws the viewer into the imaginary world of the story, even if the story is about historical events.

False stories or trick photography was also used in the motion pictures of the age of film, and new computer-generated images have increased the opportunity for deception. Because people understand that motion pictures are illusions created by the work of filmmakers, the deception is usually socially acceptable. However, one result is that film theory is facing new problems about visual effects and ideas of realism.

### **Fantasy, Politics, and Propaganda**

Because modern technology enables the public to see imagery that does not exist in reality, even more concerning to many is the fact that current graphic imaging technologies make it reasonable to believe that people can no longer trust anything they see on film, Facebook, or other digitalized formats. The saying, “a picture is worth 1,000 words,” has now shifted to “no picture can be trusted.”

Advances in the art of CGI have reached the point that distinguishing between fantasy and reality is difficult. For the cinema industry, this is just business as it has been practiced for over 100 years. Hollywood is a dream factory, and illusions are the stock in trade of movie making. However, the blurring of fantasy and fact has opened the door to the dangerous world of propaganda. Propaganda machines that practice to deceive now have access to many new CGI technologies that may be used to create disinformation as a deceptive fog that blinds the general public. Therefore, deceivers may be more likely to win in their struggle for power and policymaking.

The work of politicians is to persuade the public or other lawmakers on policy issues. Persuasion often means creating images in the minds of people. Images may encompass the dangers of weapons of mass destruction, global warming, or the threat posed by revolutionaries, criminals, terrorists, or enemy states. The use of doctored images by politicians, news media, or even the government as propaganda tools has been aided by new CGI technologies.

As CGI technologies advance and drop in price, new possibilities have opened up for amateur or other producers of politically sensitive graphics to manipulate imagery for partisan purposes. Technological advances have also made it increasingly difficult to detect manipulations. Uncertainty about the truth or the reality presented by graphic images may increase to the point where sound decision making is difficult. For example, in the United States, news stories and political positions on domestic tragedies—especially those involving gun violence or domestic terrorism—have been attacked or rejected as propaganda. Some critics believe that CGI alterations have been used to pursue agendas that will lead to violations of personal liberties. Some of these critics

are conspiracy-minded, yet the ease with which images can be manufactured or manipulated hinders any easy conclusions.

Numerous complaints have been made about the use of deceptive video fakery that is used for propaganda. For example, complaints have been made against Al Gore for using computer-generated scenes from low-budget science fiction movies to promote his global warming agenda. ABC News revealed that one of the famous shots in his film, *An Inconvenient Truth*, of supposed Antarctic ice shelves, was actually a computer-generated image from the science fiction film *The Day After Tomorrow* (2004). For a documentary to use computer-generated images to make claims that are alleged to be factual is considered by many to be a deceptive practice.

A 2013 North Korean propaganda video vilified the United States while bragging about its flourishing nuclear weapons program. The crux of the propaganda was the burning of the United States in CGI images borrowed from a modern warfare video game. The difficulty in situations like this is to determine if the propaganda is just a game, or a real intention. American officials and the general public treated the propaganda images as a threat.

Law enforcement officials have growing concerns that CGI manipulations may fool

forensic experts. Image restoration work can also be manipulated to falsify evidence. For example, dental imagery or radiology can be manipulated to show disease in order to justify insurance payments, which are fraudulently obtained because the alleged dental work was billed to a third-party payer for work that was not actually performed.

Experts engaged in forensic dental work to identify bite marks or dental remains are developing techniques to detect graphic manipulations. Alterations may be spotted if the photograph is far too perfect. If there are straight lines and perfect angles in teeth or perfect margins or shading in regrowth, the image may be suspect. On the other hand, geometric imperfections, brush marks, and uneven pixilation may also indicate image manipulation. Larger-than-normal file sizes for images of teeth may be the product of CGI manipulations.

Ethical issues have been raised about slight alterations in images by news organizations. The February 1982 cover of *National Geographic* altered an image of a camel train walking in front of the Pyramids of Giza in Egypt in order to make it fit the magazine cover's format. The magazine did not disclose that the pyramids had been digitally moved slightly closer together—that is, not until the photographer, Gordon Gahan,

Adobe Photoshop was used to create this composite of 16 different digitally manipulated photos to give the impression of a real landscape. Computer-generated images may also create virtual worlds through animation and film illusion. This deception is usually socially acceptable because most people understand that the illusion is the work of filmmakers. However, film theory is facing new issues involving visual effects and perceptions of realism and the resulting difficulty in distinguishing between reality and deception.

complained. The magazine cover became a source of major controversy, prompting Sheila Reaves, a journalism professor at the University of Wisconsin, to remark, “The enormity of moving such a large object brought home to people that you can move a shoulder or a smile.”

## Con Man

A *con man*, or the more gender-neutral phrase *con artist*, is a shortened reference to a confidence person. A con artist plays upon the trust underlying social situations. Deception is the con artist's trade. Essentially, con artists rely upon the trust individuals grant in social interactions by portraying a role that encourages others to place confidence in them, and then demand that their victims demonstrate this confidence. This is illustrated by scenarios such as the gentlemanly attorney who contacts individuals who were previously sold worthless stock, offering to buy the stock while first securing a legal fee to process the paperwork; or the helpful woman tourist who phones elderly people, sadly informing each that their grandchild is in a foreign jail and, though she tried to pay the amount owed, she only had a portion of the amount and is hoping they have the additional necessary funds. In both these examples, the con artist presents him or herself in a trusted social role—the attorney with high social status, and the Good Samaritan stranger—while offering to assist the unknowing victims and simultaneously making an implicit or explicit demand for the victims to financially exhibit their confidence.

Con artists are called by a variety of terms: swindler, scammer, grifter, hustler, charlatan, chameleon, and the broad-termed criminal. Yet the term *con artist* is unique because it suggests that an individual has presented him or herself in a social role not true to their self, that of an imposter. The con behavior occurs within the confines of what is called the con game, though it is also referred to as the trick, hustle, scam, swindle, bamboozle, or flimflam. This may take the form of a short or long con.

In the short con, the con artist, without preparation and preplanning, relieves the victims of whatever money they have available at that specific point in time, while the long con refers to con games that take a great deal of time, preparation, and preplanning to contrive. An example of a short con is the contractor who approaches a homeowner offering a cut-rate price on a service, such as a new roof, because he can see she is in need. Negotiation occurs, and the cost is lowered to fleece the individual of what she has available.

The supposed contractor then spray-paints the roof of her house, making it appear as though he has installed a new roof.

A well-known long con is the Ponzi scheme, in which investors are duped to believe that they are earning high rates of profit, yet in reality they are only receiving fake paperwork or the investment of newcomers into the con. Because long cons expose con artists to prolonged examination, Ponzi schemes are frequently in the news as these con artists are exposed and imprisoned.

Over the years, these terms have come to refer to ends of a continuum representing not so complicated to complicated con games. Long cons are frequently depicted in the media. The movie *The Sting* and the television series *Leverage* are examples, sharing a common denominator: The complexity of long cons frequently require the use of accomplices, known as shills, outside men, steerers, or ropers. This leaves one final person to label in a con game: the victim, who is referred to as the mark, sucker, or dupe.

### Manipulating Social Expectations

Key to the con game is the management or manipulation of social roles and social situations, that is, deception. A con artist is particularly savvy about human nature and unwritten rules of social interaction, with acute understanding of when to portray a particular social role or situation to encourage others to continue to perceive the role/situation as presented (i.e., to assist the dupe in suspending his or her disbelief). While many authors argue otherwise and depict con artists as basing their duplicity in the other's greed, vanity, or other motivating factor, it is much more complex than that. If con games were readily understood from analyzing a motivating factor or factors, law enforcement could profile marks and con artists.

However, this remains impossible because the complexity of social interaction is involved and is further complicated by the ability of con artists to expertly manipulate social situations to achieve their deceptive goals. When the con artist fails to successfully manipulate these situations and/or roles, marks defeat the con artist's goals; they spot the "tell," a behavior or some other information that contradicts the con's other claims, and become suspicious, refusing to continue the

suspension of disbelief. The mark's perception keeps him or her from becoming the dupe.

The vast majority of literature regarding con artists are fictional stories and research by criminal justice and sociology researchers. Con men have been beloved fictional characters for decades, beginning in the mid-1850s. In 1851, Herman Melville published one of the better-known fictional characterizations of a con man in *The Confidence-Man: His Masquerade*. Until Melville's novel, most characterizations depicted con men as conniving Yankee peddlers, but Melville created a gentlemanly character appearing in various duplicitous social roles, each time scamming a different victim. While many believe that Melville based his character on an actual con man, William Thompson, the dupes depicted in the novel were greedy and avaricious, not the everyday people Thompson conned. A more recent con man, Frank William Abagnale Jr., from the 1960s, is widely known as an infamous con artist who in his youth pretended to be various professional men, including a medical doctor and a commercial airline pilot, all in his pursuit to fraudulently obtain millions of dollars. A close reading of the book or an examination of the movie *Catch Me If You Can*, which depict Abagnale's exploits, or of *The Confidence-Man: His Masquerade*, illustrates the key aspects of a con man in the midst of his con games: assumed social roles, deception, violations of trust, and associates.

### "Cooling the Mark"

Criminal justice scholars historically discovered the difficulty of profiling a mark or con artist, and currently focus on categorizations, or types, of cons, including identity theft, traveling cons, Ponzi schemes, and Internet scams. Sociologists have delved into the complexities of the deceptive social situations and roles presented by con artists. Erving Goffman, a well-known sociologist, contributed to the con man literature with his focus on "cooling the mark."

The focus of the con man literature is primarily on the star of the show, the con man. However, Goffman places the social situation and the mark in the forefront. In so doing, he highlights the interactive nature of a con game; the con artist in pursuing his or her deceptive goals creates expectations in the mark. The mark's new

identity is that of the would-be millionaire, new home owner, helper of many—whatever the con artist via the scam suggested and the mark came to believe. But time eventually comes for the blow-off, when the con artist takes the money and leaves the mark behind.

The con game is over, but the mark now has to face his or her new identity; marks may recognize that they are now a dupe, or merely think that a terrible fate has befallen them. Essentially the mark is confronted with a new identity that they may be unwilling or incapable of embracing; and “cooling the mark” refers to techniques that a con artist uses to help the mark accept this new identity, without drawing the attention of law enforcement to the con man. In this rendition of the con, the social system of a con game becomes transparent, the importance of social roles for both the con artist and the mark are highlighted, and the interactive nature of the communication is essential.

Overall, con artists are the star of a cast, or perform solo, in a con game that is essentially one deceptive act or a series of deceptive acts designed to fraudulently obtain financial gain. Each con game has one or more marks, and each must adjust to a new, unwanted identity once aware of the outcome of the game. After the game, the con artist typically changes locales to avoid consequences, and the mark adjusts to a new identity over time.

## Concealed Information Test

Arguably the greatest concern about lie detection is the risk of falsely accusing a truthful person of being deceptive, the so called Othello error. The concealed information test (previously called the guilty knowledge test) takes an indirect approach to deception detection. Rather than assessing whether someone is or is not lying, the concealed information test assesses whether someone knows details of the crime that only the culprit could know. Although the concealed information test is more difficult to apply in real-life settings than traditional lie-detection tests, hundreds of studies confirm the validity of the concealed information test, and the Othello error is rare.

### How the Test Works

For example, say it is 8:00 A.M. and a man is having breakfast when he hears someone knocking on his door. He opens the front door and sees two police officers. They tell him that there has been a fire at his former partner’s place. He is accused of arson, and the police invite him to take a concealed information test to find out whether he knows more about the fire. The police ask if he has any idea where the fire started and what kind of material was used.

The police connect him to a polygraph in order to measure skin conductance, breathing, and heart rate. Then the concealed information test starts. The police ask, “Do you know where the fire started? Was that in the kitchen? In the garage? In the cellar? In the porch? In the hallway?”

He answers “no” to each of the options. Then, he is questioned about the kind of material that was used to start the fire. After a few questions, the test is over.

While he gets the chance to sip his coffee, the police examiner takes a few minutes to analyze the test results. As all alternatives are equally plausible, a key assumption of the concealed information test is that the innocent examinee will show similar physiological responses to all alternatives. Because the man is stressed out, his heart rate may be abnormally high but it will not be particularly higher or lower while truthfully denying recognition.

This situation is quite different for the guilty examinee. If the man did start a fire at his former partner's porch using paint thinner, the concealed information test expects him to recognize these crime details and show a marked physiological response to it.

### Studies on the Test

Since its introduction at the end of the 1950s, there have been hundreds of studies on the concealed information test, examining whether it works, under which conditions it works, and why it works. The majority of these studies were conducted in university laboratories. Here, researchers make sure some study participants have specific knowledge of a crime. Participants may be asked to select one of five playing cards, allowing the researcher to develop concealed information test questions such as "Did you select the Queen of Hearts? The King of Spades?"

Other options are to ask for autobiographical information, such as participants' birth date, or to have participants learn a list of words and ask them to conceal word recognition for the experimenter. The great advantage of such laboratory studies is that the researcher knows for sure who knows what (ground truth). A disadvantage is that the stakes are low, and that the set up and questions differ greatly from those of real-life criminal investigations. The most realistic laboratory set up is the mock crime design. Here, some participants enact a crime (e.g., the theft of \$20), whereas others have nothing to do with the crime. Promising participants that they will get an extra \$20 if the concealed information test considers them innocent is one technique that has been used to raise the stakes.

These studies have identified factors that influence the validity of the concealed information test. For example, validity is highest when the examinee is instructed to answer "no" compared with answering "yes" or remaining silent; when several questions, each having several answer options, are used; when the test is performed soon after the acquisition of the critical knowledge; when questioning about salient and central details; and—paradoxically—when the examinee is motivated to appear innocent. The concealed information test accurately detects recognition of critical information (moderate to high sensitivity). More

important, specificity is high, meaning that the chance of falsely accusing the innocent is small.

However, there is virtually no research that examines how the concealed information test performs in real life. This is all the more surprising because in Japan, the concealed information test is systematically applied, with several thousand tests being conducted each year, and the outcome of the test has been accepted as evidence in court. Laboratory studies suggest that the sensitivity of the concealed information test may be lower under real circumstances. After all, the culprit may not have noticed some details, and/or forgot them by the time of testing. Given that as many as half of all crimes are conducted under the influence of alcohol or drugs, memory failure is an important concern that could reduce the validity of the concealed information test under real-life circumstances.

There are only two published field studies in which investigators examined the accuracy of the concealed information test as applied by the Israeli police in real-life criminal investigations. These studies indicate that real criminals escape detection at a higher rate than what was observed in laboratory settings. On the positive side, specificity remained high, with only a few innocents being falsely accused of possessing crime knowledge.

### Skin Conductance and Brain Studies

Most laboratories to date have used skin conductance recorded with a polygraph to detect concealed information. Although the validity of several other autonomic nervous system measures (including breathing rate and depth, blood pressure, heart rate, and eye blinking) was explored, skin conductance remains the measure with the highest validity. In the 1980s, researchers also started to explore brain measures. Most brain studies recorded an electroencephalogram (EEG) and found that recognizing concealed information is accompanied with a positive deflection in the EEG that may start as early as 300ms after question onset. The direction and latency of this wave gave it its name: P300 (P standing for positive). More recent brain studies use brain imaging technology such as magnetic resonance imaging (MRI), enabling researchers to map which areas of the brain are most active when the examinee

tries to conceal certain information. Several regions of the brain, predominantly in the inferior parts of the prefrontal cortex, were found to be reactive to concealed information.

There is also renewed attention for a nonphysiological measure—reaction times. Although in principle, under voluntary control, in dedicated paradigms most examinees are slower to react to concealed information than to control information. Researchers have only started to explore whether a combination of measures may be more valid than any single measure. For now, there is no sound evidence that any single measure outperforms the oldest and best validated measure: skin conductance.

Having established that guilty, but not innocent, examinees show a stronger skin conductance response (and greater P300 and slower reaction time) to critical items compared to control items in the concealed information test, the question is still, why? Is it the fear of getting caught, stress, or guilt? Strong emotions such as anxiety are known to be associated with specific bodily reactions, for instance, racing of the heart. That is not what happens, however, when a guilty examinee recognizes a critical crime detail. Studies in different countries (such as Belgium, Japan, Germany, and Israel) with different participants (undergraduates and prisoners) and different set ups (playing cards, autobiographical information and crime details) showed the same thing: Recognition of concealed information is associated with a decline in heart rate.

This finding appears counterintuitive at first, but fits with the dominant theory of the concealed information test that was already outlined in the 1970s. Orienting theory states that novel and salient information captures attention, which is associated with a number of bodily responses, including an increase in skin conductance and a decline in heart rate. The cocktail party phenomenon illustrates the orienting response. While actively engaged in a conversation at a party, people are unlikely to pick up what people at other tables are talking about. When somebody calls an individual's first name, however, it is still likely that this critical information will grab the individual's attention. Applied to the concealed information test, orienting theory holds that the critical details stand out only for the guilty

examinee, and will capture only the guilty examinee's special attention. Some recent studies suggest that other mechanisms—such as inhibition—may also be at play.

Decades of research has confirmed the validity of the concealed information test, whether measuring peripheral, brain, or behavioral correlates. One of the main strengths of the concealed information test is that it provides safeguards for the Othello error and the risk of false accusations can be restricted to an arbitrarily low level. It remains to be firmly established, however, how the concealed information test performs under real-life circumstances. The key for such research lies in Japan, where the concealed information test is applied on a daily basis in real-life criminal investigations.

## Confession

Confessing is often considered to be the act of "coming clean" and telling the truth. But confessions offered to national intelligence personnel, law enforcement officers, and corporate security can be deceptive. This deception is sometimes the

result of confessors' motives to deceive (to gain notoriety, or protect others), but often it is the result of coercive and deceptive tactics by interrogators. These confessions may be wholly false, implicating the confessors in events in which they had no role at all. Or, they may recount true events, but contain many false details. Even if wholly false, confessions taken by skilled interrogators can be deceptively compelling, convincing those who judge the truth of the confessor's story, and virtually assuring the confessor's conviction. But how do these deceptive confessions come about?

Sometimes, confessions are voluntarily offered, with little to no influence from interrogators. Confessors may contact law enforcement specifically to confess, or may offer their confessions to others, such as friends, snitches, or undercover agents, without intention or awareness that they may be used against the confessor. These voluntary confessions may be true, or may be attempts to protect others, brag, take credit for a notorious crime, gain attention, or even be returned to jail. Voluntary false statements to intelligence officers may be offered to strategically mislead.

Most confessions are taken by national intelligence, law enforcement, corporate interrogators, or civilian interrogators from firms specializing in interrogation. Interrogation techniques used in these contexts have ranged from outright torture, to deceptive tactics designed to trick the target into confessing, to more honest counseling techniques designed to encourage confession. Widespread debate has surrounded issues such as ethics of coercive or deceptive techniques, their relative effectiveness, and the estimation and valuation of relative risks that each technique might elicit false information versus failure to elicit true information.

Physical and psychological coercion of prospective confessors is outlawed by U.S. law and the Geneva Conventions for treatment of prisoners of war, though these prohibitions have been violated. Public awareness of torture among national intelligence interrogators is widespread, increasing in recent years as a result of controversy surrounding their use and sanctioning by the U.S. government during the Iraq and Afghanistan wars. Proponents argue that torture is sometimes necessary to elicit required information

(particularly if needed quickly to save lives), and that these goals justify its use. Opponents consider torture unethical and ineffective, in that the target may disclose information to terminate the torture, but this information will often be false.

Though torture is still used for intelligence-gathering in some parts of the world, it is now rarely used for criminal interrogations. Though once prevalent in criminal interrogations, such techniques were implicated in the elicitation of many notorious false confessions, provoking changes in the law to discourage their use. Military and civilian courts in the United States and other countries now prohibit the introduction of confessions obtained through physical coercion, threats, or promises of leniency contingent on confessions as evidence against criminal defendants. Modern interrogation techniques have evolved to minimize the risks that a confession will be false, or that it will be regarded as involuntary (i.e., inadmissible) by the courts.

### Evolution of U.S. Interrogation Methods

In the United States, this evolution began during the early decades of the 20th century, when trickery and deceit evolved to replace more overtly coercive tactics. The Reid nine-step method—developed during the 1920s and 1930s, and refined through the latest edition of the associated manual *Criminal Interrogation and Confessions* (2011)—became the most widespread method of interrogation in North America and other jurisdictions. The method is intended to avoid interrogation of the innocent (and thereby the problem of false confessions) by first assessing suspects for deception and guilt. Only suspects deemed deceptive and likely guilty are then subjected to interrogation, in which the goal is to convince them that confession is in their best legal interests, without use of forbidden coercive tactics, thereby preserving the admissibility of any confessions obtained.

In the United States, interrogators are permitted to lie about virtually anything. For example, they may mislead suspects regarding the purpose of the interrogation, motives of the interrogator, the interrogator's authority to affect suspects' legal outcomes, and evidence against the suspect. Moreover, interrogators are free to imply that suspects will be better off if they confess. Undercover

*A Viet Cong prisoner is interrogated during the Vietnam War at the A-109 Special Forces Detachment in Thuong Duc, 15.5 miles (25 kilometers) west of Da Nang, January 23, 1967. Military and civilian courts in the United States and other countries now prohibit the use of torture in order to elicit a confession. However, torture still is used in other parts of the world for intelligence gathering.*

officers may also lie about their identity to attempt to elicit confessions.

Such deceptive tactics have been widely criticized by legal scholars and social scientists. These tactics have been implicated in causing a large number of proven false confessions. Reid techniques for discrimination between guilty and innocent suspects are controversial, and have been widely debunked by scientists studying detection of deception. Thus, innocent suspects are still interrogated. When interrogated, they can become convinced, through interrogators' lies about evidence against them, that they have no hope of exoneration, and therefore become more susceptible to interrogators' misrepresentations of the consequences of confession. Some suspects even become convinced that they must have committed the crime because the (false) evidence appeared so thoroughly to implicate them (an "internalized false confession").

Critics also assert that the Reid method, through implication, conveys threats and promises concerning the consequences of confession, violating the intent of the law to forbid their use. Whether conveyed explicitly or implicitly, critics maintain that these threats and promises function identically to convince suspects they will be treated more harshly if they refuse to confess, and more leniently if they confess. Therefore, the argument is made that confessions obtained in this way should be considered involuntary and coerced, and therefore inadmissible as evidence. However, this argument has almost universally failed to convince the judiciary. Courts in many jurisdictions have accepted threats and promises conveyed through implication, while rejecting the same threats and promises if explicitly conveyed.

When admitted into evidence against a defendant, confessions (even if false) are highly likely

to result in conviction. Interrogators are trained to elicit highly detailed and emotional written or video confessions that will seem uncontested to those who judge. Whether true or false, confessions are compelling, and are more likely to lead to conviction than any other class of evidence. Even DNA is more easily explained away than a confession.

Despite criticisms concerning ethics, efficacy, and their role in wrongful conviction, U.S. military and civil law enforcement continue to pervasively use Reid-like methods for criminal interrogations. Reforms have been more widespread in jurisdictions in Europe and Canada, removing most, or all, deceptions integral to the Reid method—most prominently, lying about evidence against the suspect. Nevertheless, such reformed methods have successfully obtained perpetrator confessions. Deceptive methods are apparently unnecessary to obtain confessions, further calling into question their ethics.

## Consciousness

Consciousness is a concept that has puzzled disciplines, including philosophy and more recently psychology and neurology, for years. *Consciousness* is a term that has been deemed difficult to define, with various disciplines and focuses of study taking slightly different angles. While some disciplines lay their foundation in the determination of consciousness as a valid concept, others view the idea of consciousness as a potential deception.

Dualists hold that consciousness is a property that is separate from the physical properties of the body and the brain; however, as the understanding of biology and the physical world, and specifically of the brain, has increased, the concept of consciousness as separate from physical processes has fallen into disuse. John R. Searle suggests that from a biological perspective, consciousness refers to the first-person phenomenon involving states of awareness, feeling, and perception that begin when individuals are awake and continue until they go to sleep, fall into a coma, or die. However, if consciousness is to be defined from a biological perspective, then it would have to be able to be compared with other biological processes, such as growth or digestion. These parallels have so far not been supported through empirical study, creating scientific problems with supporting consciousness from a biological perspective.

The acceptance of consciousness as a legitimate subject of scientific study in the life sciences has continued to gain prominence since the mid-20th century, replacing philosophy as the primary discipline involved in examining, defining, and explaining consciousness. As a concept, consciousness is an accepted experience of being human and is often used to explain much of human experience, awareness, and behavior. The concept of consciousness has remained elusive to study. With the inability to study consciousness comes the idea that this concept has the potential to be a great deception, a potential lie used to inaccurately explain much of the human experience.

### Philosophical and Psychological Perspectives

The discussion of consciousness has often been a phenomenon historically discussed from a philosophical viewpoint with the mystery of

consciousness as its focus. According to philosophical thinking, consciousness is the place where an individual witnesses life through sights, smells, and sounds, as well as a place of self-awareness. Beyond this, consciousness is where the appreciating of these phenomena takes place, and individuals' intentional actions are formed. Free will and self-determination occur here. It is the reason why human beings do things, and why the things they do matter to them.

The largest issue facing the concept of consciousness is the difficulty that comes with applying the scientific method to its study. The scientific fields may have avoided attempts to study consciousness because it has been seen as a philosophical issue or viewed as too premature to study. Consciousness, as it is commonly defined, is not discussed as something physical, such as the firing of neurons. Within psychology, this viewpoint echoes back to Sigmund Freud's concepts of the id, ego, and super ego. Freud's theory of consciousness shares a failing with more recent theories in that it appears to be a sound theory explaining the experience of consciousness, but it is unable to be proven or disproven through experimentation.

Some researchers of human behavior have put forward the concept of consciousness as a deception that individuals have convinced themselves to believe. It is suggested that consciousness is an illusion that each person manufactures to explain the complexity of his or her behavior. In this theory, consciousness is an illusion driven by the inability of science to operationally define and therefore reliably study the experience of consciousness in an objective and repeatable way. Although a person is considered to be unconscious when he or she is asleep or in a coma, and to be conscious when in a state of awareness, this is more of a description of arousal and awareness than the broader concept of consciousness. Using this on-or-off approach, consciousness is then explained in a black-and-white sense. There is no continuum for partial consciousness; individuals are conscious, or they are not. To reiterate consciousness as a scientific concept lacks agreed-upon objective structure and function, and thus there is no physical account that currently explains the concept of consciousness as each individual experiences it.

Cognitive psychologists explore consciousness as a cognitive illusion in which individuals learn to understand their experiences through introspection—the process of an individual self-examining one's thoughts and feelings. Introspection is highly contrastable with external observation, such as the measurement of physical processes within the brain. Introspection can only offer an incomplete understanding of what is objectively happening in the brain. Introspection and self-report inherently include a degree of self-deception. Neural imaging has not produced a clear understanding as to how states of consciousness are related to physical phenomena.

Consciousness can be contrasted with other mental phenomena by looking at a separate example of a concept that individuals can feel, explain, and understand, such as pain. The concept of pain can be grasped, defined, experienced, and viewed in a physical manner, such as neurological processes and brain activities that are consistently associated with the experience of pain. These factors lead to the general scientific consensus that pain is a scientifically supported concept. Consciousness is not specific feelings but the construct defining the ability to experience feelings in the first place.

### **Behaviorist Perspectives**

The behaviorist branch of psychology espoused a strong focus on psychology by only studying behavior that could be objectively measured. The primary names in behaviorism, John Watson and B. F. Skinner, completely rejected the concept of consciousness. Ivan Pavlov stated that the consciousness of the dogs in his studies played no important role because all psychological states could be attributed to conditional reflexes. Pavlov and Jacques Loeb both looked at consciousness as simply reflexes and associations, instead of an inner, subjective state of awareness. As early as 1900, Loeb denied the relevance of consciousness and considered it to be nothing more than a deception that is determined by mechanisms of associative memory. In summary, the behaviorists believed that consciousness is not a valid concept, but a phenomenon that can instead be explained by the linking of information to other relevant information in the human brain, allowing quick associations.

Skinner also believed that consciousness was a deception, and that individuals' experiences of learning behavior through conditioning and responding to stimuli in their environments explained the phenomenon. Consciousness is not a driving force of free will, as people have come to believe, but a byproduct of the complexity of individuals' learned responses involving their experiences, behaviors, and surroundings. Overall, the problems with defining consciousness for behaviorists came from the attempts to provide a mechanistic explanation for consciousness, a problem that persists today. Modern researchers value the contributions made by the behaviorists, but the question the strict criteria set of what can and cannot be studied by psychology.

To contrast the behavioral concept of consciousness, it is necessary to return to Freud. Skinner thought there was a danger involved in using mentalistic concepts to explain behavior because the arguments become circular and cannot be easily tested. There is also the issue that once a circular explanation has deceived individuals, that very deception will continue to be handed down with little questioning. This pattern is evident when discussing consciousness because of the difficulty involved in defining it. Further, Skinner used the term *explanatory fictions* to describe something that seemed to explain behavior, but actually explained nothing because there were never any real explanations involved. For instance, individuals cannot truly explain consciousness in full because they are unsure of what consciousness actually is, and therefore are trying to explain a concept that still needs to be explained wholly within itself. Skinner went on to say that these concepts cannot be objectively studied, and for this reason scientific study is difficult to achieve.

As an example of the difficulty of an untestable theory, Freud suggested that there are three levels of consciousness that determine human behavior based on his introspection and the self-reported introspections related to him by his patients. Skinner criticized Freud's ideas observable scientific research had already started to generate reliable data that genetic and environmental factors played important parts in shaping human experience and behavior, factors completely missing from Freud's theories. Skinner stated that there was no reason to assign special significance to a state of awareness

when it comes to studying behavior. Genetics, learning, and environmental factors are much less complex to study than a nonphysical concept that may or may not exist. If genetics, learning, and environment are able to be objectively measured and are shown to explain much of human behavior, there is no need to resort to intangible constructs such as consciousness. In sum, the research of the behaviorists highlight legitimate concerns about the potential of consciousness to be either a deception or a lie, used to explain the complexity of individuals' thought processes.

### Recent Research

More recent research conducted in support of consciousness as a valid and worthwhile construct of study still considers the nonobjective nature and loose definition of consciousness to be issues. One of the larger problems is that there is no comprehensive, agreed-upon description or overall testable theory of consciousness. Neurology can be used to study human behavior, but it has yet to answer why people experience consciousness or provide a model of the processes involved in consciousness. Consciousness is presented as a shared, common-sense concept, it is an obvious idea and an agreed-upon experience, and yet when researchers try to objectively examine it they realize the complexities involved. The majority of psychological and neurological researchers tend to agree that consciousness needs to be studied, and such scientific research is now attempting to address why researchers cannot answer these questions about consciousness, or for that matter prove its existence. Instead, individuals have continued to fall into the potential deception of consciousness. Researchers who argue against the existence of consciousness, such as Daniel Dennett, acknowledge that they are going against the traditional opinion and shared cultural acceptance of consciousness.

Searle argues that the brain causes consciousness, and as a philosopher, he recognizes that there are problems with the biology of consciousness as a concept, but that does not hinder his confidence. Searle, like many researchers, has taken the potential deception of consciousness as an accepted, valid concept because everyone has an experience that they agree is verbally defined by the term *consciousness*. Few concepts of human thought, feeling, and behavior have defied

objective definition, scientific study, and physiological support; consciousness is the exception in direct conflict with its common acceptance. Without true scientific data to validate the concept of consciousness, researchers are not left with much to rely on other than flawed self-reports and introspection. As a result, some researchers have concluded that consciousness may be the ultimate human deception.

Attempts to define consciousness tend to be circular; people know that consciousness exists because they label an experience as “consciousness.” As Skinner stated, such mentalistic concepts tend to become the explanations of themselves, and this then leaves the purview of science. How valid is a concept that defies a unified accepted definition, and yet the only support for its existence is that rough and unproven definition, which is then used to further define the concept while still unable to be proven or disproven. This is all suggestive of the deception that lives behind individuals’ acceptance of a unified and singular “consciousness.”

why attempts at deception succeed and fail. The idea that consensual realities matter in social life is traceable to sociologist Émile Durkheim, who noted that societies are held together by their collective consciousness—that is, by “the totality of beliefs and sentiments common to the average members of a society.”

However, consensual realities need not be common to society’s average members. Consensual realities become particularly relevant to deception when they are not shared, and when a person deliberately attempts to make another believe a particular reality. Consensual realities are often invisible, are embedded in social life, and provide a vehicle by which objective truth becomes less important than what appears to be true.

#### Consensual Reality and Successful Deception

A deception attempt is successful when it leads the target to accept that a false reality is actually consensual—for example, when the target believes that he or she knows something that the deceiver knows, but which the deceiver actually knows to be a fabrication. Social conflict and competitions frequently produce examples of how consensual realities can be deceptive.

As Sun Tzu observed in the 4th century B.C.E., “All warfare is based on deception,” and in order to deceive, parties to a conflict attempt to make their adversary adopt erroneous beliefs about capabilities, strategies, and geographical location. A competitor may feign weakness when in a position of strength (a “slow play” in poker), or may feign strength when in a position of weakness (bluffing). Whether or not one is successful depends, in part, on the target “falling for” the desired reality. It also depends, in part, on not falling for the adversary’s desired reality.

In more everyday circumstances, consensual realities are often implicitly assumed and unquestioned. Marxist theory describes the prevalence of false consciousness, in which people unknowingly accept false beliefs that undermine or hide their material self- and group interests. However, these false realities are eventually uncovered, and people may act to change the false bases of reality. In popular culture, when the hero in the film *The Matrix* discovered that his assumed reality was actually a computer simulation, he and his team staged a revolution to overthrow the purveyors of

## Consensual Reality

Consensual realities exist whenever two or more people share an assumption, attitude, metaphor, or ideology, and they are critical for understanding

the false reality. Similarly, civil rights movements are frequently motivated by the observation that a society's consensual realities—for example, that blacks are not equal to whites, or that gays are not equal to straights—are in fact lies that much of society assumes as truth.

These examples highlight a critical feature of consensual realities: Although people often remain unsuspecting about their reality, when the seeds of suspicion are sown—that is, when people come to believe that there is more to their reality than meets the eye—people may be motivated to establish the truth. When so motivated, the consensual realities that operate in the background can be detected and deceptive realities can be exposed. Attempts to discover the consensual realities held by one's adversaries have led to very creative and notable solutions.

Alexander George describes how during World War II, the British attempted to infer the consensual realities of the Germans, and in particular the Germans' beliefs about their military developments and capabilities. The British analysts believed that by studying what German commanders said in propaganda and, just as important, what they did not say, it might be possible to glean information about the German military's progress on developing a new, potentially devastating weapon.

A critical assumption was made by the British. Based on careful observation, they assumed that the German command never deliberately misled their people when it came to propaganda touting increases in the power of the German military. The German command did not bluff about their military might to their citizens. Thus, if German propaganda discussed the imminent development of a new retaliatory weapon, the British inferred that progress on such a weapon was being made. If, on the other hand, talk about the new weapon suddenly ceased but restarted in earnest six-weeks later, the analysts inferred a temporary setback in the weapon's development.

Using such techniques, the analysts were able to successfully estimate the timetable for the German development and eventual deployment of their V-weapons—the first long-range ballistic missiles ever used in combat. Knowledge of the timetable informed the urgency for military action before the devastating weapon was unleashed.

George's discussion of propaganda analysis also illustrates another feature of consensual realities. Consensual realities provide common ground from which people communicate with one another. If two people share a basic cultural metaphor, for example, that "the squeaky wheel gets the grease," their explanations and attributions will tend to converge for why, in this example, a braggart was admonished by the group. Likewise, if a culture believes that it is important that leaders not bluff to their citizens about their military power, expectations should collectively rise or fail to rise, according to the claims made. The British analysts employed such knowledge about common ground in communication and, in attempting to understand what the Germans knew but would not openly say, they were able to infer information about the Germans' consensual reality.

### **Establishing False Reality**

People appear to be psychologically built to achieve and maintain consensual realities, and this fact greatly aids in efforts to establish false realities in the minds of others. For example, people often exaggerate the extent to which their views of the world are consensual. In a classic sociopsychological study by Lee Ross and colleagues illustrating the consensus bias, students were asked if they would stand and wear a large sandwich board advertisement (e.g., "Eat at Joe's") outside a restaurant for 30 minutes. They were also asked what proportion of other students would agree to wear the sandwich board. A consensus bias emerged, as students tended to overestimate the prevalence of their attitudes and decisions. Those who agreed to wear the sign (in reality, about 50 percent) overestimated how many other students would also agree (estimate of about 66 percent), while those who refused to wear it overestimated how many other students would also refuse. People tend to view their preferences as normative, regardless of whether those preferences are actually normative. Thus, even when consensual realities are not present, people may behave as if they are.

The consensus bias illustrates how people come to believe that the realities they subjectively encounter are, in fact, shared with others. In Operation Mincemeat during World War II, British operatives sought to capitalize on the

consensus bias to deceive the Germans. The British took a cadaver from a local morgue, dressed it in British military uniform, and dropped the cadaver in the ocean to be discovered. Attached to the cadaver was a briefcase that contained false intelligence reports about an imminent British invasion. The notes suggested that the British would be invading Sardinia and Greece, whereas their true destination was Sicily. Along with the briefcase, the British included several stray artifacts, such as a ticket stub from mass transit, to increase the appearance of soldier's authenticity.

This deception was highly successful. The Germans reportedly continued to believe the false reality, even after the invasion of Sicily had begun. One can imagine how the discovery of the soldier must have been met: "What luck! We found an intelligence soldier that the British assume was lost at sea!" In wanting to believe their great find was authentic, the Germans may have been victims of consensus bias: They assumed that their beliefs and perceptions about the soldier's authenticity were shared by the British, when in fact the British held the opposite belief.

Once in place, consensual realities can be perpetuated by confirmation bias. Confirmation bias occurs when people attend to and favor evidence that confirms their hypotheses. Once the Germans had the hypothesis that the cadaver was authentic, seemingly irrelevant evidence such as the ticket stub was construed as evidence that confirmed the erroneous belief. The British planted evidence that might allow the Germans to "confirm" that the soldier was authentic. Confirmation bias is not confined to World War II anecdotes. For example, Thomas Kuhn describes how a scientific field's adoption of a particular theoretical paradigm can operate as a consensual reality that produces biased knowledge. Scientists adopting a particular paradigm may become alert for, and more likely to observe, events that conform to theoretical expectations than events that are inconsistent with or irrelevant to those expectations.

Consensual realities are pervasive and play an integral role in both successful deception and in investigating and uncovering deceptive realities. Through sleight-of-hand, misdirection, and obfuscation, people attempting to deceive others succeed by convincing them that what appears

to be true and consensual is actually false. Consensual realities frequently operate in the social background and go unnoticed, and people appear to be built to adopt and maintain them. However, once a consensual reality is recognized and deemed false, reality can be manipulated and vigorously contested in a quest to establish new realities.

## **Conspiracies**

Almost nothing is as it seems. World events are guided by the unseen hands of elite, secretive, self-interested, and/or malevolent groups. Everything

is connected. What may appear to be unrelated accidents, coincidences, or even insignificant occurrences in world affairs are actually integrated components of complex plots to control the world. The truth is actively suppressed and misrepresented to the masses by these powerful but unseen conspirators and their puppets: the mainstream media. Members of the “establishment” cannot be trusted. Evil is everywhere afoot!

Such beliefs are but a few of the suspicions reflected in the many conspiracy theories promoted by conspiracists (proponents of conspiracy theories) throughout the world. Conspiracy theories have in common the belief that an organization of individuals or groups is acting (or has acted) covertly and deceptively to achieve a malevolent end. However, the theories widely vary, including the purported size of the group(s) of conspirators, the scope of their goals and activities, the destructiveness of their intent, and the variety of separate events allegedly connected to the conspiracy.

### World Domination

Perhaps the most expansive of conspiracy theories concern the New World Order, alleging that global affairs are controlled behind the scenes by a group of international elites manipulating entire governments, and controlling financial institutions, industry, and media organizations worldwide. Variations of New World Order theories feature such alleged conspirators as international bankers, Jews, Freemasons, or the Illuminati. The Bavarian Illuminati formed in 1776 with the purpose of eliminating religious and political control in their society, but it was dismantled nearly 10 years later. No evidence of their continued existence is available, yet some conspiracists continue to assert that those who would deny the Illuminati’s current existence are deceiving themselves.

The persistence of such conspiratorial beliefs stems, at least in part, from the seminal texts of John Robinson and Abbe Barruel, written in the late 18th and early 19th centuries, which have inspired others to write about the extent of the Illuminati’s power throughout the 20th and 21st centuries. Another world domination theory—the purported Judeo-Masonic world-domination conspiracy—is described in the notorious *Protocols of the Elders of Zion*, an anti-Semitic publication that was originally published in a Russian

newspaper in 1903, and was later widely circulated, including by Adolph Hitler and Henry Ford. In 1921, the London *Times* revealed it as a hoax.

While some world-domination conspiracy theories implicate secular individuals or groups, others implicate religious groups or figures. The anti-Christ conspiracy is prominent among individuals who expect a particular individual to create a New World Order, initially deceiving the world by disguising his identity and leading the creation of a one-world government. Countless individuals have at times been accused of being the anti-Christ, including the Roman emperor Nero, Adolf Hitler, Ronald Regan, Saddam Hussein, Barak Obama, and even the Pope.

### Control of Information and Technology

Other relatively sweeping conspiracies are alleged to control information or technology, and largely implicate governments or businesses presumed to benefit from collection of information, propagation of deceptive misinformation, or suppression of technology. Popular conspiracy theories in this class include the theory that the military-industrial complex is designed to promote and profit from war; suppression of alternative fuel technologies by Big Oil and gas; suppression of alternative medicine by mainstream medicine; climate scientists’ fabrication of evidence of global warming to achieve power, research funding, or other financial gain (and the reverse conspiracy of big business to deny global warming); Bible conspiracy theories alleging that much of the Bible is deceptive; and secret groups alleged to possess control of the bloodline of Jesus (as portrayed in the novel *The Da Vinci Code*).

Among the most popular conspiracy theories in this class is that of government lies regarding evidence of space-alien visitations. While many conspiracy theories are largely promoted on the Internet or other relatively less publicized sources, theories of alien visitations and their cover-ups are widespread in books, movies, television, and other media. Some extraterrestrial conspiracy theories suggest that the U.S. government has conspired with aliens who abducted citizens—essentially bartering human rights for alien technology—and collaborated to suppress those who would report such activities. Numerous books,

as well as popular movies and TV shows such as *The X Files* or *Men in Black* reflect such theories. Arguably, conspiracies involving the existence of aliens and associated government cover-ups are among the most popular and enduring in U.S. culture (such as the widespread awareness of Area 51 and its depiction in popular media). Despite this widespread acceptance in popular culture of the existence of aliens, the U.S. government maintains that there is no factual basis for such beliefs.

### **Harm, Suppression, or Population Control**

A number of conspiracy theories allege lying or deceptive activities by governments designed to harm, suppress, or control their populations. For example, collection of vast amounts of private information by government agencies; creation of the acquired immunodeficiency syndrome (AIDS) virus by the Central Intelligence Agency (or other secretive government agency) as a tool for genocide/ population control; or fluoridation of water supplies to render populations submissive, to cover disposal of industrial waste, or for other nefarious purposes.

### **Single Perpetrator or Single Event**

Conspiracy theories far less sweeping in scope primarily address single perpetrators (e.g., President Bill Clinton and his alleged body count or assassinated associates) or single events (e.g., conspiracies surrounding the downing of Pan Am Flight 103). Many such conspiracies have surrounded assassinations (e.g., President John F. Kennedy, Dr. Martin Luther King, Jr., or Malcolm X) or deaths (e.g., Princess Diana, actress Marilyn Monroe, or union organizer Jimmy Hoffa).

A subcategory of such theories is called false flag operations, referring to attacks by governments or other entities designed to appear as if carried out by another. Perhaps the most widely discussed such theory among the U.S. citizenry is the allegation that the U.S. government lied to and deceived the general public regarding the actual perpetrators of the attacks on September 11, 2001. This conspiracy alleges that the U.S. government perpetrated the attacks (or, alternatively, that the government knew of the attacks in advance but did nothing to prevent them) in order to garner support for the subsequent wars in Iraq and Afghanistan.

These are only a few of the countless types and examples of widespread conspiratorial thinking among the populations of the world. But are these conspiracies real? If not, why have they been so popular, infecting popular thought throughout history?

### **Conspiratorial Thinking and the Nature of Human Cognition**

Conspiracy theories tend to have in common a dearth of credible supporting evidence in the face of substantial, credible, contradictory evidence. Evidence on which conspiracists depend for the maintenance of their ideologies is considered stigmatized knowledge, because of its lack of official recognition in mainstream society. Why, then, do conspiracists believe and defend them so strongly? What kinds of people are most likely to do so?

Conspiracists are often thought of as oddballs, those on the fringe of society who have some defect of character or deficiency of intellect that has led their thinking astray. However, psychologist Michael Schermer has argued that modern conspiracists simply suffer an evolutionarily valuable, but overly developed, set of three fundamental cognitive skills and tendencies. First is the ability to detect patterns and connections in their experiences, such as when a rustling in the bushes might be associated with a tiger's movements, darkening of the sky with an impending storm, or a particular shoot with an edible root. Evolutionary theory suggests that those most skilled at detecting such associations would be best able to avoid danger, attain nourishment, and survive to reproduce.

However, any learned association is fallible; the rustling sound could be no more than the wind. But when it came to potentially life-threatening events, it was better to be safe than sorry. Consequently, the genes from those suspicious and scared, yet safe, ancestors still flows through the veins of modern-day humans, giving rise to the potential for overly active pattern detectors to misperceive patterns that do not exist. From this perspective, the potential to make strange associations—to form conspiracy theories—comes from humans' evolved ability to make otherwise mundane associations.

However, the ability to learn patterns is insufficient to cause conspiratorial thinking. The second essential ingredient is the human tendency

to believe that things happen for a reason: that events are caused by seen, or unseen, causal agents. Evolutionary theory suggests that this tendency came about as humans learned to avoid carriers of contagious diseases. Those who believed that an unseen but malevolent causal agent made the carrier ill would be more likely to avoid the carrier and therefore to avoid illness and survive. This tendency to assume that intentional agents are behind otherwise unintentional events is exacerbated by humans' ability to have insight into their own thinking, and to infer the thoughts of others. Humans are capable of planning and acting—including lying and deceiving—on purpose to achieve those plans; they are also aware that others do the same. Therefore, this intellectual capacity gives rise to the notion that events happening around people may be due to the planning and actions (and perhaps the lies and deceptions) of others. When those events appear malevolent, the stage is set to assume that they are part of a conspiracy. From this perspective, conspiratorial

thinking is a natural byproduct of the human ability to learn, plan, and infer that others do the same.

Though the tendency to develop a belief in conspiracies is dependent upon these first two aspects of evolved cognition, the tendency to maintain and defend such beliefs in the face of apparently overwhelming contradictory evidence requires a third tendency: to interpret information and experiences as consistent with what people already believe. This tendency is a byproduct of the human-evolved ability to automatically categorize objects and experiences based on already existing beliefs about their nature. This automatic categorization allows people to know what to expect and how to react to objects or circumstances. Though generally helpful, these belief-based expectancies can also mislead people to interpret their experiences as more consistent with their expectancies than warranted. Strong belief in conspiracies can support suspicion of the contradictory evidence provided by (presumably deceptive and malevolent) authorities, or unwarranted belief of unscientific

*Protesters demand an investigation of a 9/11 conspiracy during an antiwar protest parade, Los Angeles, California, October 28, 2007. This conspiracy theory is an example of a false flag operation, which refers to alleged attacks by governments or other entities that are disguised as attacks by a different entity. The 9/11 conspiracy alleges that the U.S. government perpetrated the attacks, or knew of the attacks in advance but did nothing to prevent them as a way to get support for wars in Iraq and Afghanistan.*

or otherwise incredible “evidence” provided by fringe sources with lesser credentials but greater presumed trustworthiness.

### **Face-Saving and Social Support**

Belief in conspiracies and secret societies can offer face-saving benefits for conspiracists. The thought that one’s experiences are predestined or controlled by others can allow one to maintain a reduced sense of responsibility for one’s actions and the state of one’s life, and thereby reduce shame and maintain self-esteem. In short, by blaming lies that they have been told, or deceptions perpetrated upon them, conspiracists can soften the blow to their self-esteem that would otherwise be produced by taking responsibility for the shortcomings in their lives. Such beliefs may also provide social connection and support through conspiracists’ associations with communities of like-minded people. In other words, those who feel that they have been victims of lies or deceptions, endemic to conspiracies, may find comfort among their like-minded peers.

### **Personality**

Two personality traits have been associated with belief in conspiracies. Those with an external locus of control (who tend to believe that life is largely out of their control because of constraints placed upon them by others) tend to believe more in conspiracies than those with an internal locus of control (those who tend to believe that they can make things happen, and that they can control both their current situation and their destiny). This makes sense because belief in conspiracies requires individuals to believe that a deceptive and malevolent game beyond their control is afoot. Moreover, those high in psychoticism (i.e., those who have trouble distinguishing the real from the unreal) are more likely to believe in conspiracies. They are likely to be highly creative and excellent at pattern recognition, but relatively impaired at recognizing when those patterns are imaginary or random, rather than meaningful. Therefore, such individuals are prone to believing that things are not as they appear, that they have been lied to or otherwise deceived.

### **Environmental Factors**

At least two environmental factors encourage conspiratorial thinking. The first is uncertainty.

The more unpredictable an event, the further the imagination must stretch to make sense of it, leaving more room for error in the process. Such sense-making (even if through a seemingly far-fetched conspiracy theory) can render events seemingly more predictable, allowing the person to envision means of self-protection and thereby helping to restore a sense of security. Second, increasingly dangerous events promote greater need to understand their causes and avoid future danger. All conspiracies entail an element of danger and the unknown, the precise ingredients that cause some people to concoct conspiracy theories that appear to explain them. In the quest to attain a sense of certainty, control, and security, an implausible explanation is superior to no explanation at all. For conspiracists, self-deception is preferable to reality insofar as it renders the world more understandable and predictable, and allows them to take steps to safeguard themselves against their (imaginary) foes.

The tragic September 11 attacks are excellent examples of how uncertainty and danger can give birth to conspiracy theories. Virtually no one expected a plane, much less four planes, to be used as weapons on U.S. soil. If terrorists could coordinate such elaborate surprise attacks, what could they do next? It was as though the United States, if not the world, waited for the proverbial shoe to drop, as evidenced by widespread security measures quickly tightened in government buildings and airports.

The fears and uncertainties prompted by the September 11 attacks gave rise to a crop of conspiracy theories alleging orchestration of the attacks by U.S. leaders. Because of the human need for a sense of security, especially in the face of unpredictable danger, such a conspiracy theory may be preferable to reality, affording the relatively comforting belief that the United States was not under attack, but that U.S. leaders had merely lied to and deceived the public in order to grab more money and power through control of oil in the Middle East.

### **Some Conspiracies are Real: How to Tell the Difference**

Real conspiracies do exist, and excellent guidelines have been offered to help people recognize when a conspiracy is almost certainly illusory. In keeping with the scientific method, investigation

begins by assuming that any given theory is false (i.e., a lie). The burden of proof rests with conspiracists, and exceptional claims require exceptional evidence.

Such proof also requires every link in the chain of reason, not just some of them, to be logically connected, culminating necessarily at the conclusion. As for the conclusion, no other plausible explanations should account for the events. If there is more than one plausible explanation, abide in Occam's Razor; favor the simplest explanation, the one with the fewest "moving parts." Conspiracy theories are particularly likely to be deceptions when those allegedly involved must have near-superhuman powers to pull them off; when they are very complex and require many elements to occur and interlock successfully; when many actors (who must have kept silent about their activities) are involved; when they are particularly widespread in scope; or when they coningle facts with speculation and there is little distinction between the two.

As with any theory, conspiracy theories should have multiple sources of evidence from multiple, independent, objectively verifiable sources. Humans—including conspiracists and scientists alike—have a tendency to believe information in favor of their theories and disbelieve contrary evidence (known as the confirmation bias). By following these guidelines, one may hope to avoid mental biases that can distort one's perception of reality.

## Consumer Protection Laws

Consumer protection laws were first enacted in the early 1900s during the presidency of Theodore Roosevelt and continue through legislation such as the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010. The publication of Upton Sinclair's *The Jungle* (1906) exposed Americans to the dangers of the meat-packing industry and resulted in the Meat Inspection Act and the Pure Food and Drug Act of 1906. Over time, more legislation was enacted and, as a result, a series of laws now protect American consumers from false advertising, hidden ingredients, unfair practices, and faulty products. Government agencies such as the Federal Trade Commission, Consumer Safety Product Commission, Food and Drug Administration, and Consumer Financial Protection Bureau regulate industries and provide information and a way for consumers to report deceptive practices.

### Food and Drug

Prior to 1900 and the progressive reforms that accompanied the early part of the 20th century, consumer industries operated with little or no regulation. Consumer protection can be divided into two areas, consumer products and financial products. Congress stepped in to pass laws to govern these areas and create agencies responsible for oversight and education. The Pure Food and Drug Act of 1906 sought to protect consumers from deceptive practices in advertising and labeling. Patent medicines marketed to adults and children often contained high alcohol or opiate content, and the drug makers advertised false claims of the medicines curing all kinds of health

conditions. The act required labeling of products and the mandatory listing of the 10 drugs that were on the dangerous list if these drugs were ingredients in a medication. One example is Coca-Cola. Originally, the beverage contained cocaine and an attempt was made in 1909 to outlaw it. The company replaced the cocaine with caffeine and had to negotiate with the government about the amount of caffeine in the drink before it could be legalized.

Drug labeling did not require testing before the medication was marketed. In 1938, the Massengill drug company created a liquid formula of the popular antibiotic sulfanilimide and used diethylene glycol to make the syrup. Multiple deaths occurred, and it was discovered that the solution had not been tested prior to distribution. The chemical used in the medication was toxic. This spurred Congress to pass the Food and Drug Act, expanding consumer protections to include testing and approval processes for new drugs, new inspections for food processing, and testing of all new cosmetics and medical devices. The law required that products must be approved by the Food and Drug Administration (FDA) before they are sold to consumers.

In 1958, testing of food additives was added to the law, and in 1962, legislation barred any item that causes cancer in animals from being marketed to humans. These changes came as a result of medical devices that promised cures but harmed users, beauty products that caused blindness, and medications that were largely made from alcohol or harmful chemicals. Monitoring of medications continues today. As recently as 2010, the FDA pulled over-the-counter children's cold medicines and required that they be labeled for various age groups with warnings about dosages.

### **Federal Trade Commission**

Created in 1914 by the act of the same name, the Federal Trade Commission (FTC) works to protect consumers from deceptive and unfair business practices. The commission tracks complaints to see if federal intervention is needed to protect consumers from either deceptive practices in a single company or an industry. One major investigation undertaken by the commission was Operation Telesweep in 1995, targeting telemarketers. A series of court cases was filed at the state

and federal levels to crack down on 100 business scams. The FTC also started regulating the funeral home industry because of deceptive practices in pricing and services. Today, all funeral home staff must provide both a copy of the general price list for the industry and the home's price list to all customers or potential customers. Another example of FTC consumer protection is the National Do Not Call Registry, which allows consumers to list their phone numbers for free, and then legally obligates telemarketers not to call consumers who are listed.

A major agency in the FTC is the Bureau of Consumer Protection, which is responsible for educating consumers about a variety of topics and providing services for consumers. The Advertising Practices section enforces truth-in-advertising laws and investigates complaints related to over-the-counter medicines, Internet technology, and the Children's Online Privacy Protection Act. National education campaigns for consumers are planned by the section on Consumer and Business Education, which also works with businesses to make sure that they understand national compliance measures. All civil legal cases are addressed by the section on Enforcement. Issues related to Internet scams, marketing scams, spam, the Do Not Call Registry, and others are handled by the section responsible for Marketing Practices. Financial Practices oversees issues related to credit cards, credit counseling, debt collection, unfair loan practices, and predatory lending. Personal financial information issues and identity theft are addressed by the section on Privacy and Identity Protection. These various sections all work together to protect American consumers from the increasing number of deceptive practices.

### **Financial**

The stock market crash of 1929 and the Great Depression created the need to regulate and educate the consumer population. Congress established the Federal Deposit Insurance Corporation (FDIC) to protect bank deposits and the Federal Reserve to oversee the banking and financial sectors. Initially, the FDIC insured bank deposits up to \$2,500, but the amount is now capped at \$250,000. Insurance premiums are paid by the member banks, and these banks must post their proof of membership for the public. The FDIC

monitors all financial institutions to make sure that they are following banking regulations and consumer protection laws. When a bank fails, the FDIC steps in and transfers the member's funds to another financially stable institution, thus protecting the failed bank's investments.

The economic recession in 2008 revealed problems with financial practices of banks and other lending institutions in the United States. Many consumers were approved for mortgages with adjustable rates based on their gross income, versus their net income. At the same time, consumers' credit card debt increased monthly because they were allowed increased lines of credit or given offers to open new accounts. The companies extending this credit collected fees for charges that exceeded consumers' credit limits and raised interest rates and minimum payments without warning. Credit card companies made healthy profits, whereas American consumers began losing their jobs, stopped paying their mortgages, and filed for bankruptcy. Consumers are increasingly paying fees to use their money and financial institutions have grown larger via mergers.

Lenders benefitted from the intricate language of contracts that most consumers just signed without checking or trying to understand the fine print. Many financial institutions took advantage of consumers' lack of diligence when signing contracts. The downturn in the economy led the federal government to investigate banks and the fees that they charged. In the interest of the consumer, banks had to clarify the language used in agreements and simplify some of their processes.

To prevent financial companies from failure, these firms received funds from the Troubled Assets Relief Program (TARP) or loans from the government to maintain their operations. To protect American consumers, Congress passed the Dodd-Frank Wall Street Reform and Consumer Protection Act to update the Federal Trade Commission Act of 1914 and other regulatory legislation that permitted deterioration of the financial sector. Dodd-Frank established the Consumer Finance Protection Bureau as an avenue for consumers to file complaints and have their questions answered. The law changed the language of the FTC Act to include the word *abusive* in the phrase "unfair and deceptive practices." The

word *abusive* was added to protect consumers and to give them additional rights when dealing with lenders.

The recession revealed deceptive practices related to checking accounts, hidden fees, processing payments, raising interest rates, and other financial issues. It was found that the language of financial documents was often confusing to consumers and endangered consumers' financial situations. The law requires a 45-day notice from credit card companies before interest rates can be raised, and consumers must choose if they want protection plans on their bank accounts. The recession also revealed the need to educate the consumer about responsible practices and to encourage consumers to monitor financial practices for deception. Problems with deception are not limited to banking products; consumers also need to be careful about the products they purchase.

The Consumer Product Safety Commission was created in 1973 to regulate industry and reduce the number of deaths caused each year by faulty products. The commission regulates industry and tracks reports of injuries created by baby beds, toys, and many other products. If the number of injuries is excessive, the commission examines the product, tests it, and recommends corrections or recall of the product. The role of educating consumers on the proper use of the item is the duty of the company marketing the product. The commission writes the standards and regulations and publishes them for comment before they are enforced. Deceptive marketing practices by companies whose sole interest is selling their product, regardless of its safety for the target age group, are now restricted by the commission's actions.

This process also applies to items imported to the United States from other countries. An increasing amount of goods come from other nations that do not regulate industry as stringently as the United States. Consumers need to be cautious when purchasing items for children because of small parts, poor craftsmanship, and lead. The popular Thomas the Train wooden trains were recalled because of excessive lead in their paint, which could make children sick. Most of these items are made in China, where products are not closely regulated. Foreign-made baby beds with drop sides are no longer sold in the United States

because children could get trapped between the mattress and the rails. Some of these accidents are caused by consumers' careless use, but they also result from defects in the products' construction. To protect consumers, it is often safer to recall the product and remove it from stores.

Consumer protection is more complicated today because of the Internet. Personal information is found on Web sites and increases the likelihood of identity theft. Social media sites increase the likelihood of problems because of the amount of personal information posted. Agencies such as the Consumer Protection Bureau of the FTC work to educate children and adults about the dangers of posting too much information. This agency provides educational materials on home financing, work-at-home scams, telemarketing, Internet spam, and many other topics relevant to consumer protection.

Consumer protection laws have increased their scope as technology has become more advanced. U.S. law has progressed from making sure that consumers know the ingredients in a product to requiring drug interaction warnings. Some areas, such as prescription drugs and over-the-counter medicines, require both education of the consumer and diligent monitoring by the FDA. The numerous ways that criminals can obtain personal information via hacking, identity theft, response to spam e-mails, and payday loan data demonstrates the need for consumer protection. Ultimately, consumers need to be educated about how to check their personal information and the dangers that this posting can create.

As the world becomes smaller, the opportunity for consumer deception has increased. Threats come from all over the world, caused by people who can hack into computer systems or export products that do not meet the U.S. level of product safety regulation. Consumer protection laws are designed to protect the American consumer and provide agencies and commissions to oversee consumer issues. Laws are in force to protect the consumer from industry deceptions, but consumers also need to educate themselves on issues that pertain to them. Education on consumer issues is key to consumer protection.

## Contagious Disease Outbreaks

Contagious disease outbreaks can have national (epidemic) and global (pandemic) impacts. The spread of infections is sometimes intensified by the use of deception, either to shield the public from the emergence of the diseases or to mislead the public on the cause of their development and spread. The spread of disease because of deception also occurs on the part of the public and individual members of the community.

A contagious disease outbreak refers to the spread of an infection that occurs in greater numbers than is expected or normal for a particular community or region, or during a given season. Such an outbreak might last one day, or several years. In some instances, a single case might be labeled an outbreak if the disease is unknown to the scientific community. The single case might

also raise alarm if it has not been known to exist for a long time within a particular region or population. Contagious diseases can spread through a variety of means, including contaminated drinking water, commercially packaged food, person-to-person or human-to-animal contact, insects and other vectors, or bioterrorism. An epidemic usually refers to an outbreak at the regional or national level; a pandemic refers to the worldwide spread of an infection. The 2003 outbreak of severe acute respiratory syndrome (SARS) is an example of an outbreak, which claimed nearly 800 lives. Human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS) is considered a pandemic.

### Emergence and Spread

Deception can play a significant role in the emergence and spread of contagious diseases. For instance, the presence of an infection can go undetected if the methods for monitoring and reporting a contamination are hidden or not reported. Such was the case when waterborne contamination raised alarm in the Canadian community of Walkerton, Ontario, in May 2000. Dangerous amounts of *E. coli* and other pathogens were discovered in the water supply, affecting more than 2,300 individuals. A total of 65 people were hospitalized, 27 developed a potentially fatal kidney disease, and seven individuals died from infection. The provincial government launched an investigation into the causes and source of the contamination. This investigation revealed that the number of collections of samples for testing was far below the minimum number required, although this number was over-reported. Moreover, the logs used to keep track of sample chlorine levels were routinely falsified with fictitious entries. Although not the sole cause of the contamination, these deceptive practices had implications for the delay in reporting dangerous levels of pathogens, which could have prevented some or all of the illnesses and deaths that resulted.

### Government Propaganda

The threat of a contagious disease can be deceptively used to instill fear in the public, and even reinforce hatred and discrimination against a group of people. Among the many propaganda campaigns that Nazi Germany used against the

Jewish population was the claim that Jews were “filthy” and to blame for spreading typhus and other diseases. This particular campaign was prevalent in occupied Poland and was targeted toward Catholic Poles. Propaganda that Jews spread diseases was a recurrent theme used to justify quarantining Jewish communities into ghettos and isolating them from the rest of the German and Polish populations. Quarantine signs were often posted at entrances to these ghettos to prevent non-Jews from entering and seeing the poor living conditions endured within. This threat of disease evolved into a self-fulfilling prophecy as the poor sanitation and water quality within the ghettos gave rise to typhus and other infections.

With regard to real threats of contagious diseases, community members can take personal measures to protect themselves and prevent their spread, such as washing hands often, avoiding excessive exposure to public places, staying home if one shows signs of sickness, or wearing a face mask if one must come in contact with an infected person. However, individuals’ efforts can be hampered when they are deceived about the cause of the infection or how it is spread. For example, the Centers for Disease Control and Prevention (CDC) maintains a Pandemic Severity Index (ranging from one to five) to help inform the public about the seriousness of diseases that are monitored. If local, regional, or national numbers used to report disease incidences are altered or tampered, such deceptive measures could affect how the CDC reports on the disease severity, perhaps underestimating the potential danger to the public.

Deception about contagious diseases is not limited to high-level government agencies. It can also manifest as information distortion from the bottom levels upward. It is widely documented that in early April 2004, the Chinese government was making great efforts to isolate and control the SARS outbreak; officials at the national level reportedly took the epidemic quite seriously. Their efforts, however, were often hampered by some local-level officials who compromised the upward flow of information.

Out of fear of looking incompetent, these individuals either intercepted or distorted important information about the epidemic. Such deception was sometimes driven by fears that any disaster reported in their districts could put jobs in

*A public service poster warns of disease spread in the manner of Typhoid Mary, an early-1900s New York cook and typhoid carrier, Mary Mallon, who sickened numerous families via the food she prepared as a previously unknown asymptomatic carrier. Assuming that she was lying about her condition in order to continue working, health officials incarcerated and quarantined her.*

jeopardy, prevent some officials from being passed over for promotion, or simply portray a district in a negative light.

### Deception by Individuals

Even when the public is informed about the threat of disease and given measures to protect themselves, deception on the part of individuals can still intensify its spread. During the SARS outbreak, several individuals traveling out of Asia inadvertently took advantage of a loophole in the international quarantine system when they boarded flights out of their countries. During the height of the outbreak, restrictions were put in place to limit international travel out of Asia only to those infected with SARS. Unfortunately, many

contagious individuals slipped through. Some infected travelers, in an attempt to bypass the restrictions and get to their travel destinations, disguised their symptoms in order to board their planes, despite the risks to other travelers. The choice of some travelers to hide their symptoms was partly attributed to the high cost of treatment in the areas in Asia affected by the disease. In general, this loophole in security allowed contagious travelers to avoid inspection and quarantine, which could have caused the outbreak to reach countries outside of Asia.

An infected individual might also engage in deception about his or her contagion as a way to avoid stigma or ostracism. This was often the case in the past, when the nature of communicable diseases was not as well understood as it is today. A cook named Mary Mallon—more commonly remembered as Typhoid Mary—lived in New York in the early 20th century and cooked for several affluent households. Many of these households had family members who contracted typhoid fever soon after Mallon started working there. Although healthy in appearance, Mallon was believed to be a carrier of typhoid fever, transmitting it via the food she prepared for households that employed her. Mallon denied being infected with the disease throughout her life. Health officials assumed that she was lying about her condition in order to continue working as a cook. Believing that Mallon would continue infecting households, law enforcement agents incarcerated her and eventually quarantined her, on North Brother Island, east of Manhattan.

### Debates and Conspiracy Theories

Many cases of deception regarding contagious disease outbreaks have received a significant amount of documentation. More contested are the debates and conspiracy theories about deception used to mislead the public about widespread diseases such as HIV/AIDS. For instance, there is the contention that the public is kept ignorant about some of the ways that HIV/AIDS is transferred. The scientific community generally accepts that this infection can be spread through blood, semen, and vaginal secretions. However, some writers warn that there are other forms of transmission, of which the public is made ignorant, such as normal, nonsexual skin contact.

Other writers contend that when AIDS first received public attention, the federal government hid facts about its severity, transmission, and treatment from the public in an attempt to reduce or eradicate the gay male population. Still others warn that the notion that HIV can be transmitted through sexual contact is a lie. These individuals claim that the original research papers published by Dr. Robert Gallo and others were based on fraudulent data.

## Content in Context

In order to charge a person with lying, it must be shown that the person knows what is true and intentionally covered up the truth. This act of covering up is the act of deception. Lying and deception are therefore different than misunderstanding or miscommunication. Much of what is called a lie in a dispute between persons or groups might in reality be the result of misunderstanding or miscommunication. In order to avoid incorrectly labeling another as a liar, it is necessary to understand the context of his statements or actions. To understand the context is to understand that which is "within the text," or the setting in which the text occurs.

While lying is generally taken to be a positive action wherein a person makes a statement that he knows is not true, and therefore can also be said to know the truth, there can also be a negative condition of lying. A kind of culpable ignorance occurs when a person makes a false statement that he does not believe to be true, but also does not know what is true. In such a situation, the person states what he believes to be false, but what he believes to be true is also mistaken, yet he is responsible for this ignorance. This kind of ignorance can be called culpable ignorance, and a person is culpably ignorant when he does not know what is clear. To use a metaphor from vision, such a person must close his eyes to avoid what is clear; or more pointedly, such a person must deny his rationality to avoid knowing what he should know. This kind of culpability is especially important in considering the levels of context.

### Seven Layers of Context

The first factor in determining if a person has lied, and in establishing a context for the lie, is meaning. When a person tells a lie, that person is making a statement that he does not believe to be true. However, in labeling someone a liar, it must first be determined whether or not there has been a misunderstanding, whether or not the person's meaning was grasped.

Meaning is more basic than truth in that if individuals do not know what a person means, they cannot determine if that person is telling the truth. The goal of establishing context is first

and fundamentally to understand meaning. At the narrower levels of context, meaning is only partially grasped, and therefore there remain difficulties in correctly assigning truth or falsehood. Ambiguity remains at narrower levels of context, and is clarified as more context is given.

The narrowest sense of context is the most popular sense because it is at this level, or perhaps the next level, that most examinations of context end. This first level is the meaning of a given term. Because words, as conventional signs, can be used to communicate more than one concept, they can be ambiguous. This ambiguity can lead to misunderstanding or miscommunication. Specifying the exact concept expressed by a word sometimes requires the next level, which is to take note of the word's placement in a sentence. The grammatical structure of a sentence can sometimes help narrow down the meaning of a word. Nevertheless, neither of these levels rules out all ambiguity, and in the case of interpreting texts, there are many disputes about meaning, even when these two levels are carefully identified.

The third and fourth levels involve setting the sentence in a larger section or passage of a text, and then that section within the chapter of the book. This can be applied to a speech in taking the context of a word and sentence in the paragraph in which it occurs, and taking that paragraph in relation to the larger point in the speech that it supports. Both of these help in identifying the fifth level, which is the purpose of the text or speech. The idea of purpose helps one to consider the meaning of "meaning." Sometimes, "to have meaning" is identified with "to have purpose." At other times, it is identified with "to communicate content." These need not be antithetical. To know meaning is to understand, and to understand is to explain in a way that identifies what something is, and contrasts it with what it is not. In doing this, one identifies a thing's purpose, and when there is no meaning, there can be no purpose. Purpose here should not be reduced to mere utilitarian efficacy, but rather purpose has to do with the goal or end of a thing.

This greater understanding of meaning can help identify the sixth and seventh levels of context. There can still be ambiguity, even with the previous levels of context in place. This ambiguity can be identified as philosophical ambiguity.

The sixth level is meant to clarify the philosophical or worldview context of a belief. Take for instance the statement, "I believe in God." Taken in the context of a Christian as compared with a Hindu worldview, this statement takes on very different meanings. Without taking into account a speaker or writer's worldview, the use of words can remain ambiguous.

The seventh and final level of context returns to the idea of culpable ignorance. This is the level of the basic beliefs that logically support a given worldview. A person who believes a given worldview may not be aware of the basic beliefs that are logically presupposed by that worldview. Or, a person may be aware of these beliefs, and indeed profess them as true, yet they are not true. To say that a worldview logically presupposes that a given set of basic beliefs is true is to say that the truth of the rest of this worldview depends on the truth of these beliefs. The consequence is that if these basic beliefs are false, so is the rest of the worldview.

### Context and Meaning

The full act of determining context therefore requires establishing the meaning of a given term or belief within the context of a larger worldview, and identifying the presuppositions of that worldview. Where this full sense of context has not been determined there will remain ambiguity. Or to put it another way, where this sense of context has not been determined, the full meaning of the beliefs have not been understood.

Here is a third sense of "meaning," different than "purpose" or "content," and more akin to "implication." Just as "purpose" and "content" are related, so is "implication" to these prior meanings of "meaning." Unless one understands how a belief relates to a larger worldview and the presuppositions of that worldview, one will not yet know its full meaning in terms of its implications for oneself and one's intended audience of communication.

This relates to the issue of lying in that although a person might not be lying in the sense of affirming something to be true that he actually believes is false, the person might nevertheless be responsible for not having known that the given belief, nested in a larger worldview, is false. When the search for context stops at the sixth level of worldview,

there is a tendency to conclude in worldview relativism. That is, it can appear sophisticated to be able to demonstrate how different beliefs relate in competing ways when set in different worldviews. The mere awareness of competing worldviews can appear erudite.

However, when one stops at the sixth level of context, then meaning is lost rather than clarified. If there is only the plurality of worldviews with their competing meanings and truth assignments, then there is no final way to know what is meaningful and true.

Ending with the sixth level of meaning is a prominent feature of postmodernism. Where modernism tended to be unaware of its worldview assumptions (particularly empiricism and materialism), postmodernism deconstructs texts to show that they are historically situated in a given worldview. Those who hold to postmodernism often claim that the belief in truth and meaning is naïve and not sufficiently nuanced in its understanding of context.

However, postmodernists tend to fail to notice that worldviews are not merely aggregates of beliefs, but they are logically structured with an order not unlike that of the relationship between premises and conclusions. The most logically structured elements in this relationship are the basic beliefs of a given worldview. Basic beliefs are not relative to a worldview, but rather a worldview is relative to its basic beliefs. Basic beliefs are easily identifiable and are the answer to basic questions about the nature of knowledge, reality, and value.

### **Lying and Deception**

If lying involves deception in that it involves stating as true what the person actually believes to be false, then truth and falsehood must be more than simply “whatever the person thinks they are.” In other words, lying is not merely the attempt to deceive others, it is the attempt to deceive others about reality. It is the attempt to deceive others by encouraging them to have false beliefs about reality. So, lying requires that there actually are true and false beliefs about reality. Furthermore, truth assumes meaning. If a belief has no meaning, then it cannot be said to be either true or false. The implication is that all lying and deception presuppose that there is meaning.

In contrast, worldview relativism ends in the denial of meaning. All meaning is relative to a worldview, and one cannot know which worldview accurately describes reality. In the end, nothing is clear. This includes even the starkest contradictions between competing worldviews. If nothing is clear, then there can be no meaning; no given concept is clear, no sentence or belief is clear, no paragraph or chapter is clear, nothing is clear. If nothing is clear, then basic beliefs are not clear. If one cannot know even the most basic things about knowledge, reality, and value, then one cannot know anything else that presupposes these basic things.

Therefore, if one affirms that there is meaning, one must affirm that the most basic things are clear. This returns to the idea of culpable ignorance. If a person does not know the most basic things, then much of what else that person believes will either be false, or correct only by accident. Such a person might not be lying in the active sense of stating what he believes is false, but he will be stating false beliefs that he should know are false. The levels of context are intended to help avoid such a condition, and to identify those who are culpably ignorant.

In addition to lying as a way of deceiving others, lying can be a form of self-deception. Self-deception particularly relates to thinking that one knows when one does not know, and to thinking that one has been seeking to know when one has not. Self-deception can therefore be used to cover up culpable ignorance so that a person does not have to face the reality of an unexamined life. However, self-deception carries with it the loss of meaning, and therefore those who are self-deceived have an interest in denying that there is a reality of meaning and truth.

## Context

The context in which deception occurs is of fundamental importance. Context is typically embedded, an essential aspect of naturalistic (i.e., qualitative) forms of research. For example, D. L. Wieder's ethnomethodological study examines how former convicts in a halfway house negotiate their communicative acts to abide by the situated rules of the rehabilitative center, the explicit and implicit rules of the staff and the implicit rules of fellow former convicts. A thorough understanding of this particular context allowed the researcher to develop a sense-making explanation, which includes examples of when to expect a former convict or staff member to lie or deceive, and how these particular communicative acts may be differently understood by staff and former convicts. Understanding context led to a fuller understanding of the nuances contained within these communicative acts.

More recently, context has also become acknowledged as important in quantitative social science research. The primary example is the research of J. P. Blair and colleagues presenting 10 studies, each including context as an element of the study, in which participants' exhibited a much higher percentage of deception detection than previous research literature not including context, that is, a difference of on average from 54 percent accuracy to 75 percent accuracy when context is included. Context is essential to better understanding and detecting lies and deceptions in social situations.

Yet the ubiquitous nature of context, or all relevant information about a communicative act, makes it very difficult to analyze. The sheer amount of information deemed as context is overwhelming, yet research has exhibited the importance of understanding context to better

understand and detect lies and deception. Sissela Bok, in her two books *Lying: Moral Choice in Public and Private Life* (1978) and *Secrets: On the Ethics of Concealment and Revelation* (1984), demonstrates the importance of context in the very structure by which she analyzes these concepts as exhibited in her table of contents; after first defining and explaining the overall concepts, she analyzes them via the different contexts in which they are exhibited, such as lies for the public good, lies to the sick and dying, and secrets of state.

### Context and Social Situation

The social situation of the context is relevant. Many professional situations call forth perceived needs to lie and/or deceive: the nurse and doctor who prevaricate when a child asks if he or she is dying while awaiting the arrival of the parents, who have specifically asked to be present; the social scientist who deceives participants in a research study because he can perceive no other way to conduct the study; and the undercover narcotics officer who encourages drug lords to believe that he is a drug user. Many deem these deceptions acceptable.

However, deception also occurs professionally in situations carrying much stronger moral overtones: the salesman who manipulates his accounts and presents much higher sales figures to his colleagues and supervisor than he actually obtained; the nurse who claimed she administered all the narcotics she initialed for, and instead reduced the amount administered to patients, thereby obtaining the remaining pills for her addiction; and the chief financial officer who blames the economy for the poor company profits but is in fact embezzling funds. These situations would likely remain undetected by others in the workplace because of the expectation of honesty in individuals' social roles. Thus, unless the deceiver in some manner violates the norms expected of the situation, there is nothing to encourage others to critically examine the situation seeking deception and/or lies.

There are also professional situations calling forth a critical view from at least one participant, that is, when the typical expectation of honesty is not expected: the professor proctoring an exam in a course that has a notorious reputation for

student cheating; the police detective interrogating the prime suspect for a homicide; and the manager exploring via conversations with employees why the unsupervised graveyard-shift production has dropped 30 percent in the last month. In each of these examples, prior to the social situation, an act or acts has occurred to encourage the individual to put aside the natural expectation of honesty. Professional situations are only one type of social situation. There are also a variety of other social situations, for example, reading or dining clubs, churches, synagogues, study groups, and neighbors, among others. Life is full of a variety of social situations, and as with professional situations there is a breadth of expectations possible for each of these social situations in regard to lying and deceiving.

A variety of other aspects further complicate the concept of context, of which a few are mentioned here. One is the relational aspect: Are the other individuals involved in the interaction friends, acquaintances, family, or enemies? Close familial and friend relations place demands upon an individual to support another's claims, regardless of their veracity, whereas distaste for another individual may encourage claims that present the self as better than reality.

Another is the cultural aspect: Do particular regional, ethnic, or age groups influence perceptions of lying and deception? Particular social cultures see face saving as most important, above deception, which can lead an individual to place primary importance upon saving another's face. Culture can dictate taboo topics, such as sex and sexuality, religion, and finances, in which case-deceptive ambiguity assists in fulfilling cultural demands when another attempts to violate said demands. Each individual is affected by numerous cultures, including those of gender, religion/non-religion, family, ethnicity and age. There is also the culture in which the social situation resides: for example, a work group is situated within an organizational culture, and a neighborhood group is situated in the neighborhood culture.

The environmental aspect also complicates the concept of context. How do the physical surroundings impact perceptions of lying and deception? In physical settings, one can physically sense issues that confirm or disconfirm lies and deception: The little boy who reeks of

daddy's cologne while vehemently denying that he ever entered his parents' bedroom; the woman claiming that she's single and available while fidgeting with her wedding ring; and the person who calls out from the back of the house just as the home owner tells the police officer that he is home alone. Another environmental phenomenon is online interactions. Responses to various surveys indicate that respondents do not necessarily expect nor present truthfulness regarding the social roles, such as age, gender, and social status, that people project online. These surveys imply a lowered expectation of others' online honesty. Thus, physical and online environmental aspects inform the context. Even with only a few examples, the labyrinth nature of context becomes apparent.

### Consequences of Problematic Situations

Social situations suggest the breadth of context, while contextual aspects plumb the depths of layers, but there is a further element that has yet to be discussed: problematic situations with ramifications. These situations pressure individuals to choose to lie and deceive as a means of self-protection: the student accused of cheating, the citizen blamed of violating state law under a harsh regime, and the employee held for questioning regarding a case of fraud.

The sheer potential of these situations for consequences may very well influence prior behavior: the student, citizen, and employee suspecting potential harsh consequences may choose not to lie or deceive, or they might strategize more effective types of lies and deceit. Thus, the student may decide that cheating is not worth the potential consequences, or may change his or her cheating behavior from notes written on the palm of their hand to photos of cheat notes on a password-protected smart phone in a classroom in which the lecturer allows students to keep technological devices with them during an exam. This latter type of response further complicates context because possible negative ramifications motivate individuals to become consummate liars and deceivers, thereby further complicating the issue of context.

Three relevant conditions demonstrate how context can assist with the detection of lying and deception. First, an individual familiar with

another's everyday behaviors is likely to be aware of deviations from veracity, which can assist in the detection of lies and deception. Criminal investigations typically include interviews of the victim and suspect's friends, neighbors, and coworkers in the hope that they will disclose inconsistencies that could alert the investigators to lies or deception.

Second, an expert regarding the particular context perceives more information than a non-expert. An expert does not need to be licensed or credentialed, but rather have special understanding of context. Thus, an avid bicycle rider can see the muscle development in a person's calves and know whether they, too, are a bicyclist, while a financial analyst can examine a set of account books and see irregularities. Experts are frequently requested to examine contexts for potential lies and deceptions.

Third, contexts allow a verification of consistency across signals. Verbal and nonverbal claims should corroborate each other, lending coherence to the interaction. A lack of coherence, one or more false signals, can encourage participants to verify honesty or seek to see if deception is occurring.

Thus, context is a sophisticated, nuanced concept with both breadth and depth complicating a thorough understanding of its importance. Researchers of all types, while still attempting to define this complex concept, acknowledge the fundamental importance of context to the detection and further understanding of deception and lies.

## Cooperation

Any symbiotic relationship can be seen as a cooperation through which the several observed systems perform mutually beneficial work. Thus, living entities are said to cooperate when they behave in a manner that can be described as functionally interdependent. The incidental phonetic relationship between "cooperation" and "corporation" is significant in this regard, for corporation comes from the Latin word *corpus*, or body, and cooperating entities divide labor in much the way that a body does.

Cooperation can also take this form among human beings who can, unreflectively, perform tasks that work to their several benefits, much as the flower does not know its role in making honey for the bee, and the bee does not know that it is pollinating flowers. A great part of social life takes place at this prereflective, yet cooperative level. For example, in *The Wealth of Nations* (1776), Adam Smith provides an incomplete list of those who must cooperate to make a cheap woolen coat, including "the shepherd, the sorter of the wool, the woolcomber or carder, the dyer, the scribbler, the spinner, the weaver, the fuller, the dresser," and he goes on to illustrate how a cooperative of 10 people is 200 to 4,000 times as efficient as 10 people working in isolation. The high levels of productivity in social life are thus largely the result of unnoticed, cooperative labor, which can be realized by looking at one's shoes, dinner, or reading surface; if all the tasks and equipment involved had to be personally made and handled, all of these combined elements could not be obtained by a person working alone, even in a lifetime of effort.

Nevertheless, not all cooperation goes unnoticed or unintended. Where individuals deliberately cooperate, cooperation is more distinctly human and approaches mutuality, which is Erik Erikson's ideal for human coinvolvement.

### False Signaling and Exploitation Within Cooperatives

Cooperation, whether it is apparent or unapparent, conscious or unconscious, is facilitated by signaling between the several interdependent entities within the system. With this in mind, lying can be understood as a form of deliberate false

signaling introduced into a cooperative system. As such, lying can unjustly influence group outcomes, manipulating the specified activity from one that is cooperative into one that is exploitative.

Cooperative systems share goals, establish temporal frameworks, divide tasks, and distribute resources; therefore, lying can be used to manipulate and exploit other participants and the group as a whole. A lie can manipulate cooperative goals, as occurs in the novel *To Kill a Mockingbird* (1960), when Mayella Ewell accuses Tom Robinson of rape, thereby redirecting the community away from its daily routines and into a criminal prosecution. A lie can also manipulate the temporal framing of events in a cooperative system, as happens in the first tale from *One Thousand and One Nights*, when King Shahryar catches his wife committing adultery by lying to

her about when he will be home. Lies can also alter the division of tasks within a cooperative system, as happens in the tale “The Frog Prince,” when the princess lies to the frog so that he will retrieve her golden ball. Finally, lies can redirect the distribution of resources within a cooperative system, a strategy employed by the televangelist Jim Bakker in order to siphon millions of dollars away from his church-building fund, and into his personal accounts.

In all such cases, whether to benefit others or to harm them, the management of a cooperative system through lying removes the condition necessary for an autonomous agent to exercise human freedom (i.e., knowledge of what is the case) when submitting to the task. It thus draws the form of cooperation away from the principle of mutuality, and in the direction of manipulation,

The princess meets the frog in R. Anning Bell's 1912 illustration of Grimm's "The Frog Prince." Lies can alter the division of tasks within a cooperative system, as happens in this tale, when the princess lies to the frog to convince him to retrieve her golden ball. Besides dividing tasks, other characteristics of cooperative systems include sharing goals, establishing temporal frameworks, and distributing resources. Through these systems, lying can be used to manipulate and exploit other participants and the group as a whole.

or even exploitation. While the duped party may engage in cooperative ventures within the system, the mutuality governing the system as a whole (or at the level of the lie) is subverted. A wife may help her husband prepare for a business trip, and together they may resolve the financial details—the laundry, the hotel, and so forth, which could be characterized as cooperation. However, if the husband's story of a business trip is a lie, it would not be appropriate to say that the wife cooperated in his affair, nor would it be wise for the husband to use this packing and planning occasion as evidence of how well they work together when she tells him that she wants a divorce.

### **Lying to Access and Exploit Cooperative Systems**

Lying and deception are strategies of choice for those who would access unmerited positions and resources within a cooperative system. Falsifying degrees, forging passports, padding resumes, inventing backgrounds, and impersonating authorities are a few illustrations.

It is through lies and deception that the September 11, 2001, conspirators engaged the unwitting cooperation of patriotic Americans, from the instructors who taught them to fly, to the workers who built the planes, to the refiners who processed the jet fuel. By subverting the normative character of cooperative social organization through lies, 15 men were able to do to the American mainland what no army was able to do throughout the 20th century, an indication of the power of the lie.

Lies can also arise and persist in otherwise truth-telling cooperatives, particularly in order to maintain access to the benefits already derived from prior acts of integrity within the system. A spouse, for example, is a member of a cooperative system (a family) in which labor is divided and resources are distributed—resources that include familial property, income, transportation, and access to children. However, spouses make promises with respect to sex, narcotics, labor, friendships, finances, and so forth; impulse-driven at least in part, they sometimes fall short of these commitments. When that happens, the transgressor may lie to hide the unacceptable actions, thereby preserving the structural characteristics and resources of the cooperative system. Such lies are often bolstered by the efforts of duped

partners, who often collude in such lies, taking pains to allow themselves to be deceived, specifically because they also fear the damaging effects of truth upon the cooperative system. The protagonist of Leo Tolstoy's *Anna Karenina* (1877) exemplifies the liar who seeks to maintain a status quo, as her husband illustrates the colluding dupe. Such liars do not live without consequence, however; by exploiting the moral character of the relation, they compromise the psychic benefit of true mutuality within the innermost circles of their lives. Moreover, the lies shift the nature of domestic reality from “what is the case” to “what we are pretending is the case.” Simon and Garfunkel's 1966 song, “The Dangling Conversation,” gives lyrical testimony to the spiritual wasteland of such relationship, especially with the last substantial line: “You're a stranger now unto me.”

### **Cooperating to Lie and Deceive**

Lying can be a cooperative act when liars solicit accomplices into their process in order to falsify a reality for persons outside the colluding structure. Evidence in history appears as early as Homer's famous tale of Spartan soldiers cooperating to build a hollow wooden horse that could deceptively appear as an offering when it was actually a hideaway for a strategic advance force. Operation Valkyrie was the name given to the German attempt to assassinate Hitler in 1944, in which confederates involved certainly cooperated in an elaborate deception in order to orchestrate the bombing. Wherever there are plots or coups, there will also be cooperatives engaged in deceptions.

The strategy is also used in literature and film. For example, Sikes cooperates with Nancy in *Oliver Twist* (1838), confirming her lie that Oliver is her brother so that they may abduct him without interference from bystanders. The Academy's best film of 1973, *The Sting*, involved a story of cooperative deception.

In economic marketplaces, cooperative lying may occur in order to raise prices on a given commodity, a practice known as collusion in economic theory. Lying cooperatives have also been created for social research studies, such as the Stanley Milgram experiments on obedience to authority. At the domestic level, a couple having marital

problems may collude in a lie to their children or neighbors that all is well.

Cooperating liars and deceivers can also be found in sports. For example, some members of the Chicago White Sox cooperated in the deception that they were playing competitive baseball, when they were in fact throwing the 1919 World Series. On the other hand, all team sports involve cooperative deception, convincing opponents that one pattern on the field or court will be played while signaling the real strategy to teammates. There is a subtle art to simultaneously signaling the truth to partners and falsehood to opponents to create cooperative deception.

Often, the moral status of a lie is determined by the nature of the cooperative circumstances. Hannibal's deceptions when fighting Roman armies leave him regarded even now as a brilliant general, not as a liar, because deception is a normative resource in conflict, just as it is in many sports and card games. Hannibal also illustrates the fact that deceptions may have value to the group and be heralded if this is so. Group interest does not justify all lying, however, as the French military involved in the Dreyfus scandal (1894–1906) eventually learned.

Accusations of cooperative lying may be untrue; in any case, they are hard to prove or disprove. Conspiracy theories associated with the 1963 assassination of John F. Kennedy, the 1995 bombing of the Alfred P. Murrah Federal Building in Oklahoma City, and the September 11, 2001, attack on the Pentagon and New York City World Trade Center are regularly founded on the presumption that a significant number of government representatives have cooperated in an elaborate lie against the American public. Conversely, the Watergate investigations in the 1970s can be regarded as the protracted dismantling of a cooperative lie. Whenever it is said that a government has lied to its people—a frequent claim that is made about many governments—the speaker presumes the existence of a cooperative lie.

### Shamming and the Family

The most elaborate analysis of cooperating to lie and deceive can be found in the work of Gregory Bateson, Paul Watzlawick, and Juergen Ruesch. These authors pioneered the systems theory of communication and mental health that was later

popularized by psychiatrist R. D. Laing and cultural anthropologist Jules Henry. Henry's use of the term *sham* is critical because it characterizes the tacit assent to claims that are untrue, by all parties within a system, as a condition for preserving the homeostasis of the political economy. Within cooperating systems, there are sham invitations that recipients know to be insincere, sham compliments that recipients know are dishonest, and sham expressions of love that recipients know are falsehoods.

Nevertheless, as these authors document, those who are shammed regularly cooperate in the falsehood, even to the point of shamming back. Thus, social grace still requires one to offer a handshake when presented to a backbiting enemy. While cooperative sham dynamics preserve and stabilize system order at the functional level (e.g., family structure, organizational hierarchy, relational constancy) they do so at a tremendous phenomenological cost, particularly to young people entering a system and trying to make sense of what is real.

Laing uses the terms *mystification* and *fantasy* to describe the quality of experience lived by people raised in sham. His book *Sanity, Madness, and the Family* (1964) documents the impact of parental, discursive sham on the confused realities of young women who had been institutionalized; and Henry's *Pathways to Madness* traces the dynamics of performative and discursive sham for five families in which a member had been institutionalized.

## Corporate Fraud

In 2011, the Federal Bureau of Investigation (FBI) issued 242 indictments and obtained 241 convictions of corporate fraud criminals, resulting in \$2.4 billion secured in restitution orders and \$16.1 million from fines. By the end of 2011, there were 726 pending corporate fraud cases. Fraud does not just occur in large corporations such as Enron, where over 4,000 people lost their jobs. Any organization is subject to fraud. According to the Association of Certified Fraud Examiners, the typical organization loses 5 percent of its revenues to fraud each year.

Corporate fraud, as defined by the FBI, involves the following activities:

- Falsification of financial information of public and private corporations
- Self-dealing by corporate insiders (e.g., insider trading)
- Obstruction of justice designed to conceal any of the above-noted criminal conduct.

Investopedia's definition states that corporate fraud involves "activities undertaken by an individual or company that are done in a dishonest or illegal manner, and are designed to give an advantage to the perpetrating individual or company."

Fraud is not isolated to the private sector; both public and nonprofit organizations are subject to fraud, as is illustrated by the fraud perpetuated by vendors who tried to take advantage of E-Rates. E-Rate was established by President Bill Clinton to increase Internet access in schools and libraries. By increasing access, the digital divide between those of high and low socioeconomic status could be reduced. Through E-Rate, schools and libraries are able to acquire the funding needed to connect to the Internet or increase their already existing Internet access.

The Schools and Libraries Division of the Universal Service Administration Company (USAC), which was authorized to monitor the use of E-Rates, failed to provide sufficient oversight. Without oversight or accountability, vendors inflated costs to schools and libraries and sold these institutions unneeded equipment. This fraudulent conduct took place throughout the United States, in San Francisco, El Paso, New York City, Chicago, and Atlanta. The largest of the discovered fraud cases occurred in Puerto Rico, where it was estimated that the former secretary of education misdirected \$100 million of the E-Rate funding.

Many individuals can be held accountable for fraud. Even those who are not directly responsible, but may know about the fraud, can be considered liable. The legal theory of scheme liability, maintains that individuals who do not directly commit fraud, but act as secondary actors, can be held responsible and prosecuted for fraud. The Sarbanes-Oxley Act of 2002 was enacted in response to fraud in large corporations like Enron, in which corporate lawyers had some knowledge of financial mismanagement. This law establishes the expectation that instead of maintaining confidentiality, corporate lawyers will communicate up the hierarchy in the organization to report alleged fraudulent behaviors.

### How Corporate Fraud Occurs

Bella DePaulo and colleagues argue that fraud occurs when individuals have a desire to maintain privacy. According to DePaulo, "privacy and secrecy are not just personal but can be used to establish an interpersonal bond, which can then be exploited in the most nefarious ways." DePaulo cites the selling of the Eiffel Tower to

exemplify this theory. The tower was sold not once, but twice, by Victor “The Count” Lustig. Lustig first sold the tower to a scrap metal dealer. After his fraud was discovered, Lustig fled and then returned to France and sold the tower again. Meeting with dealers in secret provided him the opportunity to persuade the buyers, without the threat of anyone else finding out or calling him out on his lie.

Because individuals who perpetrate fraud are often highly educated and skilled in the art of negotiation and handling people, they may also be skilled in charming those who might otherwise be suspicious of their actions. Yet suspicion, which may be encouraged by an outside source, is needed to expose the scam. Cloaking fraud in secrecy and privacy therefore increases the ability of the fraud to continue.

Much research has focused on how to prevent or detect fraud. The composition of a corporation’s board of directors has been found to be one method of decreasing fraud. For example, in a content analysis of over 1,000 letters written by corporate presidents in annual reports, an outside director of the board who was not a shareholder significantly improved the truthfulness of the presidents’ disclosures. Further, having accountants and well-organized oversight committees responsible to the board, and not the president or chief executive officer, will help in keeping fraud at bay.

Once fraud occurs, the most effective method of discovery is through whistle blowers. Whistle-blowers are individuals within the organization who are aware of the misconduct or fraud and report it to individuals higher in the organizational hierarchy or to legal officials outside the organization. There are laws that protect whistle-blowers, but these individuals often suffer a backlash for reporting on an organization. They can lose their jobs and even their homes, and when looking for a new position, they may be unable to find work. Corporations do not want to hire individuals who have turned in their previous organization for fraud. Research has shown that whistle-blowing can be encouraged through incentives from the company or from court proceedings because the whistle-blower may be able to share in a court settlement, if fraud is proven.

Corporate fraud, costing U.S. stakeholders, workers, and the government billions of dollars

each year, remains a nebulous and challenging criminal activity that is difficult to catch and prosecute. It is possible to reduce the chances for fraud through vigilant oversight and to detect it through whistle blowers, but these are not perfect solutions.

## Corporations

The existence of corporations is beneficial because of the goods and services they yield, as well as the large number of employment opportunities that they provide. Yet, even with many laws, rules, and regulations in place, corporations and their employees are susceptible to unethical behaviors. Corporate deception is prevalent, and must be examined in order to educate individuals on how to effectively prevent, identify, and eliminate it.

Deception in corporations is a topic that is often displayed in news headlines. These headlines are attention-catching because the deception often impacts the corporation, employees, stakeholders/investors, and consumers. Many individuals may be financially affected, and some, such as customers, may lose trust in the corporation. The Enron, WorldCom, and AIG scandals made for some of the largest headlines because of the size of these corporations and the amount of money involved. Scandals such as these can mean the end of business because of fines incurred and loss of customer loyalty.

### Types of Deception in Corporations

Deception within corporations can be categorized in two ways: deception occurring during the job-selection process and deception occurring outside this process. The selection process can be defined as the nature of assessments put into place by the potential employer and taken or participated in by the candidate. The nature of the job-selection process, in which both parties hope to make a good impression while simultaneously evaluating the other, makes it an ideal environment for deception. Deception can occur at any point during the selection process, including on the corporation's Web site, job descriptions, resumes, personality tests, and during the employment interview and other noncognitive assessments. Perhaps the medium best suited to portraying an attractive, positive image of the company is its official Web site. The interview is also influential in determining an applicant's impression about the company because applicants often interpret the interviewer's behavior as a signal of what the company is like.

Corporations are not alone in trying to create favorable impressions; job applicants may also be

deceptive by changing dates on resumes, embellishing previous tasks and accomplishments to sound more impressive, or lying about past salaries. Any noncognitive self-report test is also susceptible to deception and socially desirable responding. For instance, applicants may choose the answers that they think are most likely to get them the job, such as extroverted responses on a personality test for a job in sales. Deception during the interview can include stretching the truth, omitting information that could hurt one's chances, taking credit for others' work, or even blatantly lying about experiences and qualifications.

Deception is not just problematic for selection, but may also affect individuals already employed by the organization. The various types of non-selection-related deception can be broken down into deception: about money, involving bias, about one's own work, about others' work, and involving communication.

Financial deception covers a wide range of behaviors, including compensation dishonesty, falsifying records, padding expense accounts, and embezzlement. Many employers are not altogether upfront with their employees about compensation, paying comparable employees unequally and then lying about it. Falsifying financial records ("cooking the books") is another form of financial deception. The Enron scandal is a classic example of this behavior, in which the company falsified its financial figures to look more favorable. In response to this and similar scandals, the Sarbanes-Oxley Act of 2002 was enacted to protect investors from the fraudulent financial activities of corporations.

While cooking the books is typically limited to those with access to financial information, padding expense accounts may be carried out by a greater number of employees. Padding expense accounts involves adding false expenses or inflating the value of items to obtain undeserved reimbursement from the organization. Finally, embezzlement involves the deceitful use of organizational assets (such as money, resources, and products) by individuals entrusted with them. To be categorized as embezzlement, the embezzler must have had the right to possess or use the assets at the time of the embezzlement, but must have secretly converted the assets for an unintended use.

Deceptive bias or favoritism involving nepotism and/or discrimination against protected groups is also a type of corporate deception. Nepotism is the unearned favoring of relatives, regardless of their actual skills and abilities. Discrimination involves treating an individual differently based on his or her membership or perceived membership in a certain group. According to the Civil Rights Act of 1964, individuals are not allowed to discriminate against others on the basis of race, color, religion, sex, or national origin. Deception typically goes hand-in-hand with nepotism and discrimination because companies would make trouble for themselves if they admitted to preferentially treating certain individuals based on group status, rather than merit.

Deception about one's work may involve areas such as wasting time engaging in nonwork activities, passing off another's work as one's own, exaggerating accomplishments, and avoiding blame. Employees who waste time essentially are lying about working during the hours that they are paid for working. Many may not view this as a form of deception because it often does not involve blatantly telling lies to others. Passing work off as one's own, exaggerating accomplishments, and avoiding blame, on the other hand, are more direct forms of deception that frequently involve telling lies to others.

Not only may employees lie about their own work, they may also lie about the work of others during performance appraisals. In this way, performance appraisals are more often a reflection of office politics than actual performance. Raters may deflate or inflate scores to build a case for disciplinary action or firing, allocate financial rewards such as raises, avoid backlash or retribution from the employee appraised, provide an incentive to improve performance, get even with employees, or make the rater look like a better leader. Raters may give out lower ratings to good performers because they do not want the employee to be promoted out of their current position, or on the contrary, give high ratings to poor performers to have them promoted out of the department.

Finally, lying and deception may also infiltrate employees' communications in terms of feigned deference and deception in negotiations. For instance, employees may act like they defer to their superiors when in their company, but then later

say or do things in direct opposition to their superiors' wishes. Similarly, in negotiation, employees may deceive the other party if it benefits them.

### Research Findings

Research aimed at discovering the reasons behind corporate deception point to many variables and scenarios that allow deception to occur. When the fallout from a corporate scandal occurs, many look to blame the organization's leaders and executives. Research indicates that corporate deception can be attributed to what is considered unethical behavior by corporate executives; these unethical behaviors are competitive and predatory in nature. When a corporation and its executives display predatory behaviors (i.e., behaviors that seek to take advantage of the weak) it opens the door for financial fraud. This financial predation and the lack of regulations to prevent it can be a leading cause in corporate deception.

Other research examines organizational culture as an explanation for unethical activities. While there are bound to be "bad apples" or unethical individuals, it is also possible that there are "bad barrels," or unethical cultures. Researchers explain that individuals are a product of the environment and context they are in. Corporate employees act as they see others act or as they are instructed. Unethical behaviors do not seem unethical when a corporation reinforces or neglects them. Individuals who engage in unethical behaviors often state that "they had no other choice," or that they were "told to do so." Some are forced with the choice of either being ethical, or being successful in their corporation.

The role of a strong organizational culture on individuals' whistle blowing (publicly announcing the unethical activities of an organization) can have an effect because transparent organizations with cultures lacking the ethical characteristics of clarity, congruency, supportability, and discussability will have fewer individuals partaking in whistle blowing activities, including confrontation, reporting to management, calling an ethics hotline, and external reporting.

Researchers look to psychological traps as the root cause of unethical behavior. They define psychological traps as devices that encourage an individual or organization to move in a specific direction, even when unethical. There are three types

of psychological traps: primary, personality, and defensive. Primary traps are comprised of external stimuli, such as stress to obey authority. Pressure from superiors and the desire to appease them is often stronger than one's ethical stance. Personality traps are comprised of internal stimuli in the shape of personality traits. These personality traits can make some individuals more susceptible to unethical behaviors. An example of a personality trap is the need for closure. An individual may value any outcome or concrete reasoning, even unethical, over an ambiguous one. Finally, a defensive trap is a maneuver to reverse the course of action, often to rationalize feelings of guilt or shame. An example of this would be the "false conscious effect." This can occur when an individual rationalizes his or her unethical behavior(s) to reduce the internal negative consequences, such as "I steal company supplies, but that's okay, because everyone else does too."

The organization's code of conduct may also spur unethical behavior. Simply having a code of ethics in place is not sufficient to deter unethical behavior. For example, all of the biggest corporate scandals that have occurred in recent years (e.g., AIG, WorldCom, and Enron) occurred at corporation that had a code of ethics in place. A successful code of ethics must be both high in quality and effectively utilized. P. M. Erwin's research indicates that companies with more developed and utilized codes of conduct experience less unethical behavior while experiencing higher sustainability, corporate citizenship, and a better public perception.

Finally, some researchers suggest that the lack of ethical education and knowledge leads to unethical behaviors. A prime example is an article by L. K. Trevino and M. E. Brown, debunking five business ethics myths. First, the authors explain that ethical decisions are often quite complex. They go on to suggest that the decision process is multistage, and requires moral awareness. Second, they explain that unethical behavior is much more than just the result of "bad apples."

Third, Trevino and Brown reinforce the notion that unethical behaviors cannot be curbed by a simple ethics code or program. The ethics code or program must be a true reflection of the organization and its culture to be effective. Fourth, the authors explain that ethical leadership must

go beyond the integrity of the leader. An effective leader must be ethical, but must also lead those around him to remain ethical. Finally, Trevino and Brown dispel the myth that people are more unethical now than ever before. Unethical behavior is nothing new, and organizations must learn from mistakes and educate themselves.

### Best Practices

There are a number of methods for preventing corporate deception. Some of these methods address deception in general, while others take more targeted approaches to reducing it in specific areas (e.g., in the job-selection process, or in performance appraisals).

Corporations wishing to minimize general deception have the option of requiring employees to attend ethics training. This training can promote ethical behavior and describe the impact of deception on company performance. In addition to training, upper management must support honest and ethical behavior, make honesty a part of the organizational culture, and model this behavior. If employees feel that upper management does not model honest behavior, then training and codes of conduct are not likely to be effective. Employees should be rewarded and praised for honesty, and held accountable for deceit.

Taking a more targeted approach, there are a number of steps for reducing deception during the job-selection process. First, training should be given to employees involved in the interviewing process. Corporations should emphasize the benefits of giving employees realistic job previews, especially jobs with high turnover. All literature given to applicants should focus on both the positive and less desirable aspects of working for the company to help the candidates determine whether they are a good fit for the company. To encourage applicant honesty, the organization may put warnings to respond honestly on all assessments, letting the applicant know that responses will be cross-referenced with other sources to ensure accuracy.

Corporations can also minimize the effects of lying and deception by including certain selection instruments that are immune to faking, such as cognitive ability tests (because these tests have right and wrong answers, they are difficult to fake). Finally, other selection tests, such as

personality tests, should have indicators built in to detect inconsistent or extreme responding, as well as possible faking.

Corporations may also aim to reduce lying and deception in performance appraisals as well. Upper management's support of honest and accurate evaluations is crucial. Companies should thoroughly analyze the job, identifying job requirements and job standards to ensure that raters understand the tasks against which the employee will be rated. Furthermore, organizations should make an effort to create appraisal forms that are not cumbersome, but have clear and specific directions. Raters should be trained not only on how to use the forms, but also how to keep track of employee behaviors and conduct a performance appraisal.

Corporations may hold raters accountable by using multiple raters and requiring that raters explain their reasons for ratings. Requiring raters to document behaviors as they occur throughout the appraisal period should also reduce deception to a degree. Finally, involving employees in the process may also reduce deception, especially if the employee and rater work together to develop ratings. Even if those who are rated are not allowed to directly assist in the evaluation process, there should be procedures in place for employees to appeal any unfair or incorrect ratings.

## Conclusion

Despite corporations' best efforts to curb deception through codes of conduct and other preventative measures, deception nevertheless may emerge from current employees and those applying for employment. Research in the area tends to focus on the causes and underlying mechanisms of unethical behavior in organizations, including deception as part of that broader category. Using the findings of this research as a starting point, corporations can begin to devise both widespread and targeted measures for preventing, identifying, and combating corporate deception.

# Cottingley Fairies

The Cottingley fairies was a phenomenon involving photographs of purported fairies. A series of pictures taken by two young girls allegedly depicted several of these enchanted supernatural beings. These photographs became widely disseminated as supposed proof of the existence of these legendary creatures.

In July 1917, Elsie Wright, 16 years old, and Frances Griffiths, her 10-year-old cousin, claimed that they had seen fairies while playing by a small stream, which they called the "beck," located near the Wright's family garden plot. They both lived in the same house in Cottingley Glen, a small village outside Bradford, West Yorkshire, in England. Arthur Wright, Elsie's father, thought that the story was nonsense, but the girls persisted, insisting that they had indeed seen the fairies. Mr. Wright eventually loaded a photographic plate into his Midg quarter-plate camera and sent the girls off, telling them to return with a photograph

B. ELSIE AND THE GNOME

Photograph taken by Frances. Fairly bright day in September, 1917. The "Midg" camera. Distance, 8 ft. Time, 1/50th sec. The original negative has been tested, enlarged, and analysed in the same exhaustive manner as A. This plate was badly under-exposed. Elsie was playing with the gnome and beckoning it to come on to her knee.

D. FAIRY OFFERING POSY OF HARE-BELLS TO ELSIE

The fairy is standing almost still, poised on the bush leaves. The wings are shot with yellow, and upper part of dress is very pale pink.

*The photographs and captions for "Elsie and the Gnome" (left) and "Fairy Offering Posey of Hare-Bells to Elsie" appear in The Coming of the Fairies (1921) by Sir Arthur Conan Doyle, who was fooled by the trickery of two schoolgirls using paper fairy cutouts and a camera in 1917. He was not the only one deceived; careful examination of the photographic plates by representatives of the Kodak company in 1920 could not find "any evidence or superposition, or trick." The spiritualist fervor of the era lent credence to the hoax.*

of the fairies. Elsie returned with the camera, and later that Saturday afternoon, Arthur Wright developed the plate, unsure of what he saw appearing as the plate was developing in his dark-room, with Elsie behind him claiming that they were fairies. The photograph showed Frances in a semireclining pose, with four fairies dancing in front of her and the babbling brook behind her.

That August, Frances used the camera to take a picture of Elsie with a gnomelike figure. The second picture was rather unclear and underexposed, and Mr. Wright thought the girls had been playing tricks and refused to lend them his camera again. He, his wife Polly, and Annie Griffiths, Frances's mother, searched the attic bedroom that the two girls shared and the wastepaper basket, looking for any evidence of scraps of cut-outs and other signs of fraud. Elsie and Frances stuck to their story; the pictures were circulated to neighbors and friends, and then were largely forgotten.

Two years later, in the summer of 1919, Polly Wright, Elsie's mother, attended a meeting of the local Theosophical Society in nearby Bradford. She had initially been dismissive of the girls' stories. Nevertheless, the Theosophy (spiritualism) lecture that evening happened to be on fairy life, and after the talk, Polly mentioned the two fairy photographs that her daughter and niece had taken. The discussion was overheard, which is how these mysterious prints came to the attention of the Theosophists, who displayed them at their annual conference a few months later in Harrogate, England. By early 1920, news of the photos caught the attention of Edward L. Gardner, one of the leading Theosophists, who asked to see the pictures.

Gardner was initially cautious, and sent the original glass plate negatives for analysis by Harold Snelling, a photography expert, who concluded that the negatives were genuine and

showed no indications of tampering. In July 1920, Gardner travelled from London to Cottingley Glen with two Kodak Cameo cameras and about 20 photographic plates, secretly marked. Frances, who by then had moved to Scarborough, England, with her parents, was asked by her Aunt Polly to come back to Cottingley Glen, where she and Elsie met with Gardner. Gardner gave each girl a camera and some of the plates, along with instructions on their use and cautions about distance and lighting; he told them that they were under no compulsion, but if the weather was fair and they could entice the fairies to come out and be photographed, he would be appreciative.

Word of the Cottingley fairy photographs made its way to the ears of Sir Arthur Conan Doyle, the noted author and creator of the fictional character Sherlock Holmes. Doyle was interested in spiritualism and had been commissioned to write an article on fairies for the 1920 Christmas edition of the *Strand Magazine: An Illustrated Monthly*. Conan Doyle's article, "An Epoch Making Event—Fairies Photographed," was released in late November. At the urging of Gardner and Doyle, Elsie and Frances took three more purported fairy photographs. In 1921, Doyle published another article in *The Strand Magazine* titled "The Evidence of Fairies," which featured two of the three additional photographs taken in 1920.

In 1921, Gardner made another expedition and his final visit to see Elsie, then 20 years old, and Frances, age 14, at Cottingley Glen; this time, he was accompanied, on the recommendation of Doyle, by the clairvoyant Geoffrey Hodson, who claimed to see numerous fairies. However, the fairies refused to be photographed on this occasion. Doyle's original article from the *Strand Magazine* on the fairy photographs was reprinted in his 1930 book *The Edge of the Unknown*, a collection of essays on psychic phenomena. In 1945, Gardner published his book, *Fairies: A Book of Real Fairies*.

Gardner commissioned Snelling to make contact positives, negatives, prints, and two glass lantern slides, without retouching or any other modifications, which Gardner could use to illustrate the Theosophical Society lectures that he regularly delivered across Great Britain. Snelling continued to provide prints that were sold at these talks.

Gardner and Conan Doyle sent copies of Snelling's prints and negatives to Kodak for analysis by the company's experts, who agreed with some of Snelling's findings, but added that this should not be taken as conclusive evidence that they were authentic photographs of fairies. The pair also contacted another photographic company, Ilford, to review the evidence, but when the company concluded that there was evidence of faking, Gardner and Conan Doyle dismissed these findings.

In 1978, James "The Amazing" Randi, a well-known American debunker, along with a team of experts from the Committee for the Scientific Investigation of the Paranormal, studied the Cottingley fairy photographs with a computer enhancement process, and thought that strings seemed to be attached to some of the fairy figures. Randi also reported that the images in the initial Cottingley fairy photograph bore a striking resemblance to illustrations from *Princess Mary's Gift Book*, published in 1914.

Geoffrey Crawley, editor of the *British Journal of Photography*, examined the evidence and concluded in reports published between 1982 and 1983 that the photographs were fakes. In an interview for the *Yorkshire Press* on March 19, 1983, Elsie finally confessed that she and Frances had cut out pictures of fairies from a book, glued them on cardboard, and mounted them on hat pins before staging them for the infamous photographs. Frances died in 1986, and Elsie followed in 1988. The photographs and two of the cameras used to create them are currently on display at the National Media Museum in Bradford, England.

## Courtship, Deception in

The primary purpose of the courtship process is to have the time and space to thoroughly get to know a potential partner, to determine similarities and differences, and to decide whether or not the relationship has the potential to become a more permanent commitment. Multiple studies have shown that trustworthiness and honesty are seen as the most desirable characteristics in a romantic partner, regardless of the length of relationship sought or the sex of those involved. Trustworthiness and honesty ranked higher than an exciting personality, good health, adaptability, dependability, sense of humor, and kindness/understanding. This suggests that people believe that honesty is an essential part of any close relationship and is a characteristic that each partner should strive to achieve. However, the reality is that the vast majority of relationship partners lie to each other at some point.

### Lies During Initial Courtship

When embarking on a new courtship, it would be difficult to overstate the importance of first impressions. Research suggests that people make their first impressions of others in less than three seconds after meeting them. Ensuring that they are putting their best foot forward becomes imperative in order to attract and engage with high-quality potential partners. From an evolutionary perspective, competition for quality mates is challenging, particularly for women who bear the brunt of the responsibility for having and raising offspring. For this reason, women are more

likely than men to exaggerate, downplay, or out-and-out lie about who they are.

Evolutionary theorists propose that men are attracted to women because of their desire to father as many healthy offspring as possible, and for this reason they are attracted to younger, healthier-appearing women. Thus, women are motivated to lie about their age (generally saying they are younger than they actually are), or are particularly careful with their physical appearance in the hope of appearing younger and healthier. In addition, women have been found to downplay or hide any major diseases or illnesses that they have experienced or are experiencing in order to avoid questions concerning their ability not only to procreate, but also to birth healthy babies. From the same evolutionary perspective, women are thought to be focused on finding a mate who will not only be able to father offspring, but will also be able to financially support and physically protect those children that come from their union. In this way, men are motivated to overestimate their earnings, the importance of their job, their physical prowess, and level of maturity.

While some may suggest that these theories are more appropriately applied to times past, research on deception in online dating sites bears out these claims. Men who use online dating sites are more likely to exaggerate their income, education level, age, and desire for a long-term committed relationship. In their online ads, men are also likely to enhance their physical appearance, claiming to be taller, more muscular, and having more hair than in reality. Women, on the other hand, tend to downplay their income, education, age, and desire for a long-term relationship. Their ads also enhance their physical appearance in ways that map onto evolutionary theory, claiming to be larger-breasted, thinner, and with long hair (implying youth).

Even in face-to-face modes of courtship, researchers found that if they could make a date with a potential mate who was high in facial attractiveness, both men and women were willing to lie about their intelligence, personal appearance, personality, income, past relationship experiences, and career skills. Once they secured that first date, things appeared to worsen. A full 92 percent of college students admitted to lying to a potential romantic partner about sexual issues.

Lying does not end when two people establish a close relationship; at best, lying decreases in frequency. While one in every three interactions with a close nonspouse romantic partner involves deception, only one in 10 interactions with close-relationship partners is a lie. This is not as substantial a drop in frequency as many might think.

### **Lies Once the Courtship Has Begun**

Outside of the lies that people tell when they are first meeting, or planning to meet someone new, courtship partners are more likely to engage in lies of omission, rather than lies of commission. In these developing relationships, information that may be unflattering to the individual is often withheld, sometimes permanently, other times until the relationship has developed to a deeper level and is capable of withstanding serious revelations. “Secrets” such as surviving childhood sexual abuse, having a criminal record, or being in remission from a serious illness such as cancer are topics, few people address on a first or even second date. While some courtship partners see this as a lie, those who are in possession of this potentially sensitive information are often not hiding the facts, as much as they are waiting until they feel comfortable enough with the partner to disclose such personal information.

There are even more gender differences in terms of lying within courtship or romantic relationships. Both men and women lie, and tend to do so in relatively equal numbers; however, what they lie about most significantly differs. Men are most likely to lie about their past, while ironically, women are more likely to lie to their partner in order to support him and be positive in the hope of increasing closeness in the relationship. Once a serious lie has been told, however, women are more upset, anxious, fearful, and remorseful than men. Men and women also differ in terms of the premeditated nature of their lies. Research also suggests that men put greater planning into the lies that they tell casual friends, while women put more premeditation into the lies that they tell their close friends.

### **Joint Lies**

The lies that people tell and deceptions that people enact in courtship and relationship situations

vary from those told to strangers and acquaintances in at least one other vital way. First, most research on lying treats this type of deception as an individual act. In courtship and other close relationships, however, there are circumstances in which the receiver or target of the lie is directly involved in its perpetration.

The first type of jointly constructed lie is known as *connivance*. This is a situation in which an individual knows that his or her courtship partner has lied but chooses to act as though they are unaware of that fact. They may be “letting sleeping dogs lie,” respecting the liar’s right to privacy, storing away the information for future blackmail purposes, or waiting for him or her to confess. For whatever reason, the target of the lie chooses to pretend that he or she does not know that deception is being practiced by his or her partner.

The second jointly constructed lie is known as *collusion*. In collusion, the teller and receiver of the lie agree in advance to collaborate in deception. One of the most common examples of this type of collusion is when one partner tells the other up front that, if he or she has an affair, “do not tell me about it.” More specifically this means, “if you have an affair I want you to lie to me about it.” This type of joint deception is often used when the punishment for telling the truth may well equal the punishment for lying about the action.

Second, lies told in courtship or romantic relationship situations are rarely one-offs. One of the problems with lying in these types of relationships is that once the individual starts lying he or she has to keep up the pretense. Lies frequently come back to haunt the teller, which then necessitates remembering the lie, repeating the lie, and potentially telling even more lies to maintain the original deception. This is particularly true with complex lies in which the lies are being told in order to continue with a deceitful behavior, such as cheating.

### **Detecting Deception in Courtship**

People like to believe that they are good lie detectors and that with their romantic partners they are particularly skilled at unearthing untruths. Studies have shown that in these circumstances, people are accurate in detecting deception about 54 percent of the time. However, this number is

likely artificially inflated by the fact that individuals engaged in courtship are much more accurate at recognizing the truth. One of the biggest courtship-oriented problems that people face in terms of deception is that they believe that they are generally successful at lying to their courtship partners, and conversely, that the partners are not successful at lying to them. Put more simply, people are good at recognizing the truth, bad at recognizing deception, and when they are not sure if they are being lied to, they prefer to extend the benefit of the doubt to their courtship partners. McCormack and Parks model of deception detection (published in 1986) supports this belief, indicating that as a relationship becomes closer and the partners become more intertwined, their confidence in their ability to detect their partner's deception increases. Coupled with a "truth bias," in which partners presume that they are always honest with one another, this suggests that a great deal of deception may go undetected in courtship and indeed many other types of close relationships.

### When Deception is Detected

When deception is successfully detected, at least three factors play a role in determining the impact of the lie on the relationship. Research has shown that increases in the importance of the information lied about, the importance of the act of lying to the relationship, and the level of relational involvement experienced by the partners are all positively associated with greater emotional intensity when the deception is discovered. In particular, the importance of what the lie was about appears to be the strongest predictor of whether or not the relationship will continue. For example, even if an individual believes that honesty is a crucial part of a relationship and they are not yet deeply involved with their partner, they are far less likely to break up if the discovered lie involves a preference for chocolate ice cream over vanilla than if the lie deals with relational fidelity. This suggests that while the motive for lying certainly matters, what exactly people are deceptive about is equally important in deciding the fate of an interpersonal relationship.

## Coyote

A coyote is a human smuggler who shepherds would-be illegal immigrants within and across borders in their journeys to new homes. The name *coyote* is derived from depictions of the namesake animal as a mythical trickster in Native American and indigenous Mexican cultures. The combination of heroic and deceptive characteristics attributed to the trickster in these cultures is likewise attributed by would-be immigrants and their local cultures to the human coyotes who both assist and betray them. Migrants, who would otherwise face dangerous and unfamiliar

obstacles as they illegally cross one or more borders and many miles of terrain in transit to their (primarily) U.S. destinations, heavily rely on their coyotes to provide protection and guidance, and to trick and deceive agents tasked with preventing or detecting migrants' illegal crossings.

### **Illegal Immigrant Crossings**

Coyotes' main objectives are to help immigrants travel within an intermediate country en route to the target border, cross borders into intermediate or target countries, and travel without detection to final destinations within target countries once their borders are successfully crossed.

Several common strategies are used for border crossings, including some aimed at successful deception at legal ports of entry. Coyotes may provide forged documents and identities, or legal documents for temporary use, enabling migrants to successfully cross legal ports of entry and immigration checkpoints once across the border. They may also conceal migrants as passengers or cargo in vehicles that are legally crossing.

Coyotes may also assist migrants to cross at illegal points of entry along the border, while successfully evading the U.S. Border Patrol, frequently guiding migrants by foot through arduous terrain such as desert, brush, and mountains to avoid immigration checkpoints. They may use infrared scopes, cell phones, and computers to keep track of their clients' destinations, often cooperating with other coyotes in a larger sophisticated network. Clients may transition between several coyotes as they cross within and between countries.

The need for coyotes' services among those who cannot achieve legal or less dangerous methods of entry into the United States appears to outweigh concerns about their reliability, and may render migrants vulnerable to coyotes' many self-serving machinations. While marketing their services as helpful and protective, coyotes are also known for deception and abuse of their clients. This deception may begin with coyotes' attempts to attract clients. In order to overcome the reluctance of doubtful or fearful clients, coyotes may misrepresent such issues as the dangers and difficulty of the terrain that migrants will travel through, the amount of time required, conditions for transport, probability of successful arrival at their destination, total fees for the coyote's services, and

the dangers of some coyotes' trickery, and even violence.

### **Codependence in Deception**

Once the journey has begun, migrants' isolation from external support or law enforcement and their position in unknown and challenging terrain, creates a dependence upon the coyote that can enhance fear, increase the need to trust the coyote, and render migrants vulnerable to new demands that the coyote may impose. The coyote may change the terms of engagement when faced with a newly fortified border, for example, knowing that the now dependent client will have little choice but to agree. Coyotes argue that these unexpected new obstacles require more money, and may even hold migrants hostage until the families pay their increased smuggling fees.

Though not commonplace, in some instances, the increased power and control enjoyed by the coyote can be reflected in physical force or abuse. Moreover, in some instances, the coyote may completely violate his "contract" by abandoning migrants who do not maintain the pace of the group. Coyotes have even been known to rape, rob, and murder their clients, or provide them to others for use as drug mules or sex slaves.

While migrants are heavily dependent upon their coyotes during the journey, coyotes can also become dependent upon their clients. If caught attempting illegal border crossings, coyotes face steeper legal consequences than migrants. To avoid such sanctions, coyotes attempt to masquerade as migrants, thereby becoming dependent upon their clients to maintain this deception. When questioned by the U.S. Border Patrol, for example, migrants may claim that their coyote abandoned them. Coyotes whose clients are caught after arrival in the United States may likewise depend upon the clients to conceal their identities, if questioned by law enforcement.

Coyotes may also depend upon referrals for continuing success in their business. Despite the opportunities and temptations of the power that coyotes enjoy over their clients, their reciprocal dependence on these clients suggests that it is in the best interests of individual coyotes, and the community of coyotes as a whole to maintain a positive reputation in the migrant community, and the good will of their clients during transport.

Assisted by migrants' desperate need for their services, coyotes as a group appear to maintain a sufficiently positive reputation to support a thriving business. Despite widespread knowledge of the dangers and fallibility of illegal border crossings, and of the risks of dishonesty and abuse among coyotes, many nevertheless trust coyotes to guide them, perhaps hoping or assuming that their coyote will not be among those who betray and take advantage of their clients. Such desperate and hopeful migrants will continue to attempt coyote-assisted illegal crossings for the foreseeable future. Increased border surveillance on behalf of the U.S. Border Patrol, in addition to more stringent immigration laws, has rendered would-be immigrants ever more dependent upon their services.

journalistic credibility. To fully understand the scope of credibility and its role in deception, one must examine both contexts. The word *credibility* can be traced back to Aristotle and his *Rhetoric*, in which he stated the following:

Persuasion is achieved by the speaker's personal character when the speech is so spoken as to make us think him credible. We believe good men more fully and more readily than others: this is true generally whatever the question is, and absolutely true where exact certainty is impossible and opinions are divided . . . his character may almost be called the most effective means of persuasion he possesses.

Aristotle used the Greek word *ethos* to refer to credibility. When considering the classic mode of the concept of credibility, insight is gained from understanding the three components of *ethos*. According to Aristotle, *ethos* is made up of intelligence, virtue, and good will. Each of the three components is connected to what Aristotle refers to as *hexis*, or "habits." Intelligence is a mental habit, virtue is a moral habit, and good will is an emotional habit.

*Ethos* or credibility, as defined by the classicists, is created by what people say, or the message, and is dynamic, ever-changing. Just because a person has credibility does not mean that he or she will always have it. Credibility is a caused response; it is earned through the message or the actions of the person. One cannot discuss credibility without mentioning the seminal work of psychologist Carl Hovland, who investigated source credibility and the connection it had with the likelihood of message acceptance.

If credibility is something that is earned, one may ask how is it earned, or what is the best way or earning the highest credibility. Early research maintained that credibility was connected with expertness and trustworthiness; however, later research provided evidence questioning this oversimplification of credibility. General trustworthiness and how much one is worthy of confidence remain important elements of personal credibility. Credibility is often assessed in terms of intent as well as reliability and accuracy. Long-term consistency in reliability and accuracy leads to a good reputation or greater credibility. Building a

## Credibility

When considering credibility and deception, one may think of relational credibility, or one may consider credibility of information, such as

history of accuracy is an important determinant of credibility. Another determinant is confidence. Confidence is considered to be one of the most prevalent indicators of assessing one's credibility.

### **Calibration of Credibility**

Calibration refers to one's confidence level and the accuracy or likelihood of being right. A well-calibrated person has a high confidence level when he or she is likely to be right and low confidence when he or she is likely to be wrong. Through interactions, individuals become aware of how calibrated others are and make assessments of credibility. Researchers have concluded that understanding the value in reading the calibration of another person is a learned skill that people gain over time. Adults are better at reading calibration cues in others, and when another person is deemed credible, adults gain confidence in interacting with him or her. However, if credibility is violated at any time, adults will be suspicious in future interactions as a result of the loss of credibility. Children, however, are less skilled in reading calibration cues. Confidence overrides calibrations in many cases for children. Research has yet to discover at what age or stage of development calibration decoding cues are learned.

Some psychologists believe that credibility is not an attribute of one's personality but rather of the message. For instance, U. Undeutsch argues that creating truthful or deceptive messages is a situation-specific behavior, not a personality trait. According to Undeutsch, credibility can only be detected in the message, not the person *per se*. There are four types of indicators to assist such detection: characteristics of the verbal message (e.g., content of message, details or lack of details, and logical consistency), paralinguistic cues (e.g., speech rate, tone of voice, and pauses), nonverbal behaviors (e.g., smiles, gestures, and head nods), and psycho-physiological reactions (e.g., blood pressure, heart rate, and respiratory rate). The last type of indicator is usually measured by a lie-detector machine that shows various psycho-physiological reactions.

### **Journalistic Credibility**

Credibility is not just an interpersonal or relational construct. Credibility of information, such as journalistic credibility, is important to

examine. With the widespread reach of the Internet and other forms of media, the credibility of information is not always apparent. It is worth asking if all information is of equal value. Traditional news outlets, both print and broadcast, employ a longstanding tradition of editorial and gatekeeping rules that help ensure the accuracy and trustworthiness of the information presented.

However, in recent years, there have been lapses in this gatekeeping, resulting in loss of credibility. Unlike traditional forms of media, the Internet lacks editorial and gatekeeping rules, which results in avenues for deception.

Over the years researchers have examined the credibility of the media. Media credibility is complex and depends on many elements. It is thought that the most important elements are believability, fairness, accuracy, bias, degree of sensationalism, and depth of information. E. Ognianova's research frames online news story credibility in terms of nine semantic differential items: factual/opinionated, unfair/fair, accurate/inaccurate, untrustworthy/trustworthy, balanced/unbalanced, biased/unbiased, reliable/unreliable, thorough/not thorough, and informative/not informative. Other researchers, such as C. Nadine Wathen and Jacquelyn Burkell of the University of Western Ontario, maintain that there are seven criteria needed to judge if the information on the Internet is credible: source, content, format, presentation, currency, accuracy, and speed of loading. They argue that readers/users use different, less traditional, considerations to form judgments about credibility.

Credibility researchers Shawn Tseng and B.J. Fogg identified four types of source credibility: presumed, reputed, surface credibility, and experienced credibility. Presumed credibility occurs when a person relies on his or her general assumptions about a person. For example, a person generally assumes that his or her best friend is a good person, or his or her parent has good intentions. Reputed credibility is based on an outside source, such as an endorsement. This type of credibility is very prevalent on the Internet. One Web site deemed credible may offer links to other sites, which may or may not be credible; however, because there is a connection between the Web sites, there is an implied credibility. Reputed credibility is often related to one label, such as

president, doctor, priest, or teacher. Source credibility is based on one's first impression and initial judgment, whereas experienced credibility is based on one's consistent experience with the source. This type of credibility is earned through usage and/or interaction.

Credibility is a rich transactional process, which varies across contexts. There are common themes that are deeply rooted in one's evaluation of credibility. Themes that are consistent across context and time include trustworthiness, accuracy, consistency, and overall believability.

## Cromwell, Oliver

Oliver Cromwell continues to be a controversial figure. Defamed as a dictator by some, he is praised as a hero and protector of liberty by others. Although a leader in the English Civil War who elevated the powers of Parliament against

the monarchy, he is criticized for taking a position as lord protector of the Commonwealth of England, Scotland and Ireland that amounted to having the powers of a king. Although in some ways he worked toward religious toleration, including reversing the banishment of Jews from England, he is cited with the use of violence against those with whom he disagreed, particularly the Catholics. Although he is known for having encouraged a high level of morality among the soldiers under his command, he is also held responsible for brutal acts of warfare, particularly in his campaigns in Ireland. The result is that today he is cursed by the Irish, and is remembered for having deepened the divide between the Irish and the English.

As in considering any controversial figure, all of these elements must be taken into account in order to give a full picture of the person. Rather than presenting Cromwell as either a saint or a sinner, or as a person with extreme personal incongruities, it best to understand him within the context of his religious enthusiasm.

Cromwell lived from 1599 to 1658. He was born into a middle-class gentry family. There is some indication that he struggled with depression in his earlier life, but at some point in the 1630s he underwent a religious conversion. This conversion is known from the letters he wrote, in which he described himself as the chief of sinners, who was now repentant and converted. He rose from leading one cavalry unit to being a chief commander in the New Model Army, and then a part of the Rump Parliament that signed and executed the death warrant for Charles I in 1649. Cromwell's role in the execution of the king is most relevant for considering his beliefs about lying and deception.

### Religious Enthusiasm

Cromwell's reliance on what is called "religious enthusiasm" helps make sense of his conversion, his strong emphasis on morality, and his commitment to fighting against any perception of compromise or deception in England. Religious enthusiasm refers to the belief that God is directly speaking to a person, particularly through the person's feelings or affections. This can be seen in Cromwell's conviction of sin and his need for redemption, but also in his belief that God was directly guiding him in the choices that he made

as military commander. Religious enthusiasm is different than the belief that the Bible can be applied to current situations, or that there is a moral law known from general revelation (both of which Cromwell perhaps also believed).

Because of his religious and political beliefs, Cromwell played a leading role in the decision to execute Charles I. Cromwell believed that the king had lied and been deceitful in his dealings with the English people. This kind of deception provoked the displeasure of God and nullified the contract between the king and the people. This deception necessitated not only the removal of Charles I, but also his execution because it had led to bloodshed among the English people. Cromwell was the third person to sign the execution document of Charles I.

This principle that deceit by a king nullified the king's right to rule was a point of contention in the 17th century. This principle was in contrast with the belief in the divine right of kings, which held that a king was given his throne by God, and that only God could remove him, not Parliament or any human being. Cromwell championed the idea that a king is only entitled to rule while he maintains certain moral and social conditions, which in England dated to the Magna Carta. However, Cromwell also believed that the rule of law was sovereign, and that the rule of a king or any other person was not. When a king violates the rule of law, especially if this violation occurs through deception, then the king must forfeit his rule.

### Cromwell and the Puritans

It seems evident that Cromwell viewed himself as having a special role in advancing both this political philosophy and the Puritan cause. At the time, the Puritans understood that they were in conflict against hierarchies led by human figures, whether the king or the pope, who had violated the law of God. It is especially notable that during this time, the Westminster Confession of Faith was written (1648), which is a high-water mark of Reformed and Puritan theology. The confession came to have significant influence in the American colonies and the United States, whereas its influence was considerably less in England, perhaps because of the political turmoil during and after it was written.

Cromwell is best understood in light of his religious enthusiasm, his commitment to the rule of law over the rule of kings or popes, and his conception of the struggle between the purity of worship and society against institutions that assert personal authority and hinder persons from true Christianity. However, this view also includes a combination of religious and political goals. When political goals sometimes require force, as during war, the people in the 21st century are especially concerned that religion remain separate from politics. For that reason, Cromwell is now judged as having improperly combined the two.

## Crying

Crying is a complex human behavior that is most often regarded as an irrepressible expression of pain or sorrow. Crying first appears immediately after birth, long before speaking, walking, and other forms of human behavior that exist across the lifespan. In its earliest form, it functions as instinctive signaling; the cry indicates to caretakers the infant's state of discomfort. Such crying can thus lead to burping, feeding, changing, holding, and other caretaker actions in the service of the infant's needs. Eventually, infants

learn other strategies for meeting their needs, including grasping, walking, and speaking. As this happens, the role of crying as a form of social signaling diminishes for the child.

Nevertheless, crying persists in childhood and throughout adulthood, and can still be seen across the stages of life. In its most primeval form, crying persists as a spontaneous reaction to forms of discomfort or pain, especially in childhood. Adults are generally socialized against crying as a response to pain, however, there is a tendency to replace pain-driven crying with other forms of emotional release, such as swearing and screaming. Adults and children may also cry when something is lost, such as a valued object, family member, lover. Under such circumstances, the act of crying is regularly treated as an irrepressible emotional outburst, indicative of deeply experienced feelings.

The audience response to infant crying is important to any understanding of the relationship between crying and lying. First and foremost, the infant cry is experienced as authentic. The person who hears an infant crying takes the sound to be a genuine expression of a negative emotion, one that is deeper than a communicative strategy, and this means that audiences are primed to interpret crying as evidence of truth. The infant cry is also experienced as anguish-inducing. Mirror neurons that govern empathic experiences cause audiences to live the anguish of the other in an imitative neurological state, and this happens to audiences exposed to an infant's cry. Finally, the infant cry is experienced as impelling; it triggers within its audience a motivation to eliminate the infant's suffering, as well as its own.

### **Crying as Artifice**

While crying is often spontaneous and true, it can also arise as a powerful form of artifice. The controlled signaling of crying behavior emerges before the end of the first year, in the form of anguished sounds ceasing when the infant is granted trivial satisfaction. For example, a baby may make anguished noises in order to be lifted from the crib, bounced in a jumper, or repositioned in front of a television. All such goals have comparatively little to do with suffering, and might therefore indicate that the child has moved past crying as

an exclusively pain-driven instinct toward crying as a conscious signaling strategy.

Even without the conscious decision to manipulate by crying, however, manipulative crying may develop. Various psychological theories, including Ivan Pavlov's classical theory and B. F. Skinner's operant theory, support the notion that manipulative crying can develop in a person who has no intention, and possibly not even the competence, to develop it. Thus, while false crying and real crying appear to be two alternatives at polar odds, they may rather be points on a continuum. Deceivers can believe their lies, and they can believe their lies to varying degree, even enough to cause them to cry. All the same, where such performances exist, the roots of strategic crying as a form of deception and social control are well in place.

All lies have weight, and they grow more believable as they grow heavier. In order to get the measure of their truth value, sense-making audiences attend not only to words but also to word contexts, which include persons, places, things, and actions. One may say, following W. I. Thomas, that audiences are constantly keen to establish the definition of the situation, whether the situation be defined as play, real, or a falsification of the real. The first two definitions are negotiated between the speaker and the audience; the latter must be independently determined, particularly when the audience has preliminary reasons to doubt. A successful liar attends not only to the character of the lie but also to the false physical and emotional environment that the lie creates. (For example, liars who claim that they were mugged tear their shirts and bloody their noses in advance of the lie.)

An accomplice can add weight to a lie, as can false evidence, and crying is another way to add weight to deception. Crying, to the extent that it is presumed a spontaneous release of irrepressible emotion, adds to the veracity of the claims that attend it when the performed grief is consonant with the declared falsehood (e.g., "I can't take my test this morning because my grandfather died").

A well-placed tear can have national repercussions. Anchorman Walter Cronkite, for example, attained an iconic position in the history of television because he took off his glasses and wiped a

tear from his face when announcing the death of President John F. Kennedy. It is therefore possible to wonder whether other journalists have strategically struggled for the elusive teardrop around which careers are made. Whether such tears are regularly deceptions cannot be known, for the deceiver is an elusive animal.

Nevertheless, the mechanism is well-known and was used to powerful effect in the film *Broadcast News*, when Tom Grunick (William Hurt) demonstrated to his love interest, Jane Craig (Holly Hunter), that his crying while reporting the news was a talent over which he had dramatic control. The mistrust that he engendered in her character with this crying is similar to the actual effect that attended O. J. Simpson's crying after his wife's death, with crying episodes following his murder trial and during his armed-robbery trial. Broadcaster Howard Stern interpreted Simpson's crying after his murder trial as evidence that Simpson was a sociopath; Judge Jackie Glass called Simpson both ignorant and arrogant when she sentenced him for armed robbery after his tearful plea. Once one is believed to be a tearful liar, tears can do more harm than good because they germinate an emotional energy in their audience but they no longer signal the presence of truth. Instead, they signal the dangerous character of the speaker.

Literature has long recognized the dangerous nature of crying and tears when they are used to warrant a deception, with William Shakespeare, for example, referencing the crocodile's tears in *Othello*. The liar who can support a lie with tears is feared, in part because his tears can elicit classically conditioned or mirror-neuron-induced, emotional responses in an audience, even after the audience consciously knows that the crier is an untrustworthy deceiver. For this reason, it is not uncommon to experience the crying liar in what Anna Freud has labeled a reaction formation—the audience channeling the evoked emotional energy away from its dangerous form (in this case and with this crier, pity) toward a form more appropriate for the deceiving recipient of the feeling (in this case, contempt).

### Crying and Politics

In public life, it has often been claimed that politicians cultivate a talent for deceptive tears.

Presidents Bill Clinton, George H. W. Bush, and Barack Obama have been accused of using tears to their political advantage. Because crying can work to a positive rhetorical effect, the accusation that one is a false crier may be strategically necessary to dispossess a speaker, often a politician, of whatever audience gains that the crying garnered. On such occasions, it matters little to the accuser whether the crying was deceptive or not—the intent of the accusation is not to reveal the truth of a person but to subvert the crier's advantage, although the distinction may mean little to the accuser. At some levels, it is often the case that public expressions of grief are stage-related, because it is easier to release some forms of emotional energy in a staged event, a phenomenon

*Crying persists as a spontaneous reaction to forms of discomfort or pain, especially in childhood. Crying as a powerful form of artifice, outside of suffering, emerges before the end of the a child's first year, in the form of a child stopping his or her anguished sounds when he or she is granted trivial satisfaction.*

observed by sociologist Randall Collins and one that can be seen in the collective histrionics of revivalist groups.

Sociologist Émile Durkheim was also well acquainted with the releasing effect of collective sentiment. Generally, persons cultivate a capacity to withhold emotions in order to function in society, which correlatively means that they carry unreleased emotions. A ritual event, an event that is apart from daily life, unburdens the individual from the pressures of routine, offering an occasion for the release of what might otherwise be held back, something of a vacation from habitual emotional control. This context, in combination with the effect of what Durkheim referred to as the energy of the collective, can work to release emotional energy that has been present but has been held under control. The effect can seem excessively timed, but this may be no more an indication of falsehood than the fact that people do not tend to close their eyes and sigh with relief until they are at home, in comfortable reclining chairs, with their shoes off. However, some crying is nothing more than

deception, and the falsified tears of the accused, ambitious, vengeful, and even the disenfranchised are legion.

## Daily Life, Lying in

Researchers studying lying in everyday life have surveyed participants, often on a daily basis, to ascertain key details about lying, including the frequency with which people lie, the type and function of lies, individual differences in lying, and the emotional consequences of lying. Researchers have concluded that lying is incredibly common, serves personal and social functions, varies considerably across individuals, and may trigger acute distress. Although there are methodological limitations in this area of research, these studies provide useful insights into lying on an everyday basis.

### Form, Function, Personality, and Emotions

Lying to others is not entirely unusual. A review of empirical literature assessing daily lying frequency reveals that human beings admit to telling lies in, on average, 20 percent of social interactions. On a typical day, people lie an average of approximately one time, but some lie as many as five times, and about 10 percent avoid lying altogether. The type, function, and perceived magnitude of these lies vary across individuals and contexts. To better understand this variability, researchers have created taxonomies of everyday lies, drawing from human participants' reports of their routine lying experiences—an assessment technique often referred to as the daily diary technique.

Types of routine lies that have been identified using this technique include active lies, passive lies, and exaggerations. Active lies are characterized by an outright attempt to conceal or contradict the truth by presenting false facts. For example, a college student going to a party may claim to his parents that he will be studying all night with his peers. Also, a cheating partner or criminal suspect may lie about their whereabouts. Passive lies involve deliberately omitting or evading information with the objective of creating a false sense of reality. For example, a real estate agent may fail to notify a potential home buyer about a leaky roof with the aim of fashioning a positive impression of the property. Similarly, in a relationship, one partner may avoid mentioning a stressful aspect of their day in order to avoid triggering unnecessary distress for their partner. Finally, exaggerations are marked by an overstatement of the truth, in contrast to blatant fabrication. For example, a tropical vacationer may boast a temperature that is 10 degrees warmer to a distant hometown friend. Similarly, an individual may play up personal accomplishments during a job interview or first date.

### Motives for Lying

Not all lies have the same function; motives for telling lies are variable. Lies may be self-focused, other-focused, or altruistic (some deception researchers use the latter terms interchangeably,

though a distinction is made here). Self-focused lies are generally told to save face (that is, impression manage), or to avoid judgment or admission of personal weaknesses and failures (e.g., a university student tells his peers that he earned high marks on his failed biology exam). People may also tell self-oriented lies to avoid discussing sensitive emotional information, evade responsibility or commitment, or even to avoid verbal or physical confrontation (e.g., a tenant tells his landlord to expect a rent payment tomorrow, despite a depleted bank account).

Some empirical studies have found that self-oriented lies are more frequently told to strangers or acquaintances than close others (e.g., friends, family, and romantic partners), perhaps attributable to the desire to maintain interpersonal closeness or the presumption that close others may be more suspect of deception (though this varies by attachment style). Other-focused lies are told to protect the psychological welfare or self-interests of others on the receiving end of the lie (e.g., a dinner party guest praises the host's cooking skills despite his disgust). Resembling other-focused lies, altruistic lies are intended to protect the interests and emotions of others; they are distinct in that they are told to a third party regarding the individual to be protected (e.g., a college student reports to her professor that her class-skipping roommate and classmate is attending a funeral).

While people are less likely to tell lies to close others (in contrast to acquaintances or strangers), overall the lies that they tell close others tend to be other-focused in nature. Deceiving friends, family members, or romantic others can be personally distressing, particularly when lies are self-serving. However, in circumstances in which the psychological welfare of a close individual would be at stake when presented with an honest statement, the use of other-focused lies may be more readily justified.

### Attachment Style, Personality Theory, and Demographics

The finding that self-oriented lies are generally told to strangers or acquaintances is nuanced because exceptions have been found in literature about attachment style. One's attachment style, or way of relating to intimate others (e.g., parents,

lovers, and friends), is associated with the types of lies one tells and to whom. In particular, some research has identified differences in daily lying between individuals with an anxious versus avoidant attachment style. The anxious attachment style is marked by a desire for emotional closeness, a fear of abandonment, and dependency on others; this style is associated with telling a higher frequency of self-oriented lies to strangers or nonromantic friends than to romantic partners. Alternatively, those with an avoidant attachment style, characterized by a fear of dependency and intimacy, are prone to tell more self-oriented lies to their romantic partners (a close other) than to strangers or friends, seemingly to maintain an air

*People may tell self-oriented lies to avoid discussing sensitive emotional information, evade responsibility, or avoid verbal or physical confrontation. For example, a tenant calls her landlord and tells him to expect a rent payment the following day, when in truth, she has a depleted bank account.*

of independence and to limit vulnerability in their most intimate relationships.

Building on this attachment style literature, researchers have also attempted to understand variation in lying through the vantage point of personality theory. Personality refers to characteristic patterns of thought, emotion, and behavior. Commonly, personality is measured across five broad domains: neuroticism (the tendency to experience negative emotions and emotional dysregulation), extraversion (the tendency to experience positive emotions and prefer social interactions and activity), openness to experience (the tendency to try new things and enjoy intellectual topics), agreeableness (the tendency to be polite and nonconfrontational), and conscientiousness (the tendency to work hard and be orderly and responsible). Each of these domains incorporates a number of smaller facets of personality; for example, neuroticism facets often include anxiety, anger, depression, self-consciousness, immoderation, and vulnerability.

Personality research shows that liars in their daily life are less conscientious, less agreeable, and more neurotic than average. For example, in the authors' research involving large international samples of adults, individuals who reported lying more frequently were particularly low on conscientiousness; they reported that they had a lower sense of duty or ethical obligation to others, had lower academic achievement, were less self-disciplined, and were less friendly to others. Those who lie more often are also more disagreeable; for example, they find it challenging to trust others, they describe themselves as less moral and altruistic, they are less cooperative, and they are apparently less humble in describing their strengths. Those prone to lying are also more neurotic, and are particularly prone to sadness and depression. Lying is not particularly related to extraversion or openness to experience. In summary, personality research suggests that in their daily lives, individuals prone to lying are more self-interested, confrontational, and sad, and less interested in morality and work ethic.

There may also be important demographic differences in daily lying. Much of the research in this domain has focused on gender differences. On average, females report that they lie slightly more frequently than males. They also

tend to believe that they lie more successfully than males. However, the gender of the person being lied to also plays a role. Specifically, lies are more likely to occur in same-sex interactions than opposite-sex interactions, with lying most common in female-to-female interactions. Other demographic characteristics have received less attention. Some studies suggest that across adulthood, individuals lie less frequently and are more trusting with age. Other factors, such as race, ethnicity, and socioeconomic status, have not received attention in research on daily lying. Although lying varies across the population, it is relatively common.

### **Social and Personal Acceptance of Lying**

Despite its commonness, lying is not an explicitly accepted social behavior. If one is asked whether they support the act of lying, or if they would teach their children to tell lies, it is most probable that they would respond negatively; frequent use of the age-old maxim "honesty is the best policy" speaks to this claim. Not all lies are equally socially unacceptable, however. There are some data that suggest self-serving and malicious lies are condemned more than lies that are intended to protect others (other-oriented and altruistic lies).

For the average individual, the perceived magnitude of telling everyday lies is diminutive, resulting in minimal guilt and cognitive stress. This is particularly true of individuals who are characteristically manipulative (have the ability to influence) and are able to act in social situations, as some research has demonstrated. This may also be an artifact of confidence in lie telling; some data suggest that everyday lie tellers tend to be confident that they will not be exposed, and if one's lies are convincing, considering how the target might feel in the case of disclosure is futile. Lying also has emotional consequences for the person being lied to, including anger, sadness, and contempt. When someone is lied to in an interaction, they report greater dislike of the lie teller and are also more likely to increase their lying in return. Thus, while the lie-teller may experience minimal guilt and cognitive stress in the moment, the longer-term repercussions of lying are potentially sizeable in that they may risk harming later socioemotional functioning.

The notion that lying is a reproachable behavior highlights the difficulty that lying and deception researchers confront when trying to learn about the frequency and content of individuals' lies. A significant methodological concern in research on daily lying is that it assumes that individuals will report their lies with relative openness and honesty. For example, when an individual reports lying zero times per day, this is taken at face value, but it could be that some dishonest individuals also lie to understate their frequency of lying. This may be more common when individuals are asked to report on lies told in contexts that are socially undesirable (e.g., lying about cheating on a partner, or lying to cover up a crime).

Thus, existing reports may underestimate the frequency with which people lie, particularly in socially undesirable contexts. Some techniques have been developed to destigmatize lying and make participants more likely to honestly report on their lying behaviors in a research context. One approach is to emphasize to participants that lying is not condemned in the context of the investigation. Other strategies include emphasizing confidentiality or providing participants with anonymity. Still others include embedding response validity items within surveys, items such as "I read the entire newspaper each day," to weed out participants who are providing obviously invalid information.

A number of studies have been conducted to document the form and function of everyday lying. This research shows that lying is common, but complex; it comes in a variety of forms and serves several different functions. The form and function of lying varies among individuals, based on their attachment style, personality, and demographic characteristics. Although lying is common, it has emotional consequences. There are methodological challenges in research on everyday lying, leaving the door open for novel future investigations in this domain.

## Darwin, Charles

Charles Darwin left the world a substantial legacy of theory and research through both animal and human observational and experimental study. An English naturalist, Darwin proposed in his book *On the Origin of Species* (1859) the theory of evolution of species by descent from common ancestors, describing the evolutionary mechanism of natural selection and the struggle for survival. Darwin's works have informed and at times predicted future research on deception in the social and evolutionary sciences. While Darwin did not often directly write on deception, and while such descriptions often focused more on animals than humans, Darwin's ideas are a forerunner of modern deception research regarding both detection and practice.

Darwin mentions human deception detection in his book *The Expression of the Emotions in Man and Animals* (1872), in which he argues that facial expressions are inherited and adaptive for the persons generating an emotion, allowing for better reaction to their environmental context. Darwin describes communication with colleagues who

report how people of various races detect deceit from expressions. Shifty and guilty eyes and eye movements play a prominent role in these descriptions, which foreshadow later work on beliefs about deception detection. Darwin did not focus on the mechanics of differentiating deceptive from genuine emotionally rich facial expressions or on their production, but his ideas concerning betrayal of true feelings and of feigned emotional expressions led him to originate two important hypotheses in early deception-detection research. Paul Ekman refers to the first as the inhibition hypothesis: If one cannot produce an action voluntarily, then one cannot prevent it when it is triggered by involuntary impulses such as emotion. The second involves Darwin's idea that facial muscles are the most difficult to control when one is emotional and that body cues (e.g., shaking from anger) are easier to suppress.

Ekman has argued that Darwin's first hypothesis is consistent with his own hypothesis concerning emotional leakage (betrayal of emotion, despite attempted concealment). Similarly, Ekman and his colleagues' work on microexpressions (brief, involuntary facial expressions presumably caused by emotional experience) directly follow on Darwin's idea regarding leakage. Darwin also refers to what is now called the Duchenne smile—the genuine smile, almost impossible to voluntarily produce or prevent.

### Challenging Darwin's Ideas

Recent research challenges Darwin and Ekman's ideas. Studies consistently find that people are normally only slightly better than chance (about 54 percent) at discerning truths from lies. The various cues that both Darwin and Ekman refer to may largely be misconceptions, or those exhibiting them examples of "leaky liars" (4 percent above chance). Darwin's ideas provided scientists with greater understanding of the coevolution of deceivers and the deceived, with some researchers positing that the evolutionarily functional advantages of human facial expressions to deceivers are also advantageous to observers by signaling emotions. Analysis of the latter aids observers' survival. Some researchers have proposed and found support for the idea based on Darwin's inhibition hypothesis that facial cues (e.g., muscle contraction), leakage of genuine emotion,

and unsuccessful false-emotion displays are more prominent in high-stakes emotional situations involving complex lies.

Before discounting Darwin's contributions, consider that much of modern deception-in-practice research—concerning when, why, and how people lie—can also be traced back to Darwin's ideas. Based on his reasoning, including thoughts on levels of animal mimicry and human social behavior, several modern authors posit categories of deception generally equating to genes-based, learned, and intentional. Humans fall in the latter group, which requires theory of mind (TOM)—the ability to attribute differential mental states to oneself and others.

Darwin's ideas about human social interactions are primarily discussed in chapters 4 and 5 of *The Descent of Man and Selection in Relation to Sex* (1871). Together with TOM, these ideas later influenced the Machiavellian intelligence or social brain hypothesis, a key competing hypothesis of human brain evolution. The idea is that humans' large brains and enhanced cognitive aptitude evolved through social pressures to develop more sophisticated deceptive strategies for helping navigate social environments and enhancing survival and reproductive success. Darwin's discussion of cooperative behavior within groups in *Descent* also spurred later research on the evolution of cooperation and defection, with deceptive cheaters trying to maximize their reproductive success; research on group solidarity to examine why in-group members may be deceptive toward out-group members; studies on the effects of reputational concerns; and research involving subtle cues of being watched increasing prosocial behavior. Research on cooperators and defectors inspired by Darwin's insights on the desire for good relations with in-group members, in which he speaks of the loyalty of savages to each other but not to strangers, anticipates modern deception research, showing that people lie more to out-group members than to in-group members.

Darwin's logic of evolution by natural selection also provides an underlying reason for Bella DePaulo's three-part classification of the lies people tell—self-oriented, other-oriented, and third-party altruistic—in which the type of lie told would depend on the survival/reproductive benefit to the individual and/or group. Darwin's

observation in *Descent* regarding the seemingly inherited tendency of certain upper-class families to lie and steal has also recently been supported by research showing that higher social class predicts increased unethical behavior.

Finally, regarding the animal kingdom, Darwin's observations led to and informed later research on mimicry, the evolution of (dis)honest signals in relation to both prey-predator interactions and mate acquisition (e.g., courtship), and potential instances of tactical deception in non-human primates and other animals. Such work, along with Darwin's writings on sexual selection, formed the basis for many scholars today studying the role of deception in human partner acquisition and retention.

Charles Darwin's works and the ideas formed from those he passed on to his collective descendants have played an important role in shaping the way deception research is conducted in the modern world. His theory of evolution via natural selection and his insights into behavior have informed work on both deception detection and practice.

## Deception, Attitudes Toward

Most research on attitudes toward deception points in the same direction. It shows that attitudes tend to be negative. Although telling a lie is publicly condemned, research and experience prove that deception is nonetheless very common. This resonates with other often-found evidence demonstrating that even though a person might hold a negative attitude toward deceiving someone else, this attitude will be attenuated by a multitude of factors, including situational aspects, intentions, and his or her position or perspective. It seems, therefore, that an exception to the rule is easily made.

Deception can be found in all realms of life, and attitudes vary accordingly. Most people will agree that lying about Santa Claus to their children is permissible, whereas deception by governments or banks is widely criticized. On one hand, parents want to raise their children to be honest people and for that reason parents teach their children to never tell a lie. On the other hand, parents also want their children to be polite, decent people, so that on their birthday, a child must pretend to like grandma's gift. In some situations, telling a lie is even seen as the moral thing to do. Almost all people, even those who have a high moral standard, will deceive another person while holding the belief—and maintaining it to others—that they are adhering to their ideal of honesty.

Throughout history, records of attitudes toward deceptive behavior have been dominated by accounts of theologians and philosophers. The

philosopher Immanuel Kant, for example, declared that one should never tell a lie. Doing so would throw away a man's dignity. He reasoned that people owe the truth to everybody, even to a murderer at the door inquiring about a friend's whereabouts. However, the notion that lies are at times justifiable—an idea that was already common in antiquity—could not be held back. Although historical accounts inadvertently condemn the act of telling a lie, bending the rules to serve self-interest was not an exception; with the prescription not to tell a lie, exemptions always followed soon thereafter.

### **Factors Affecting the Acceptability of Lying**

Today, attitudes about deception are also predominantly negative. However, one should not jump to the conclusion that all lies are seen as bad. One reason for this is that factors that make telling a lie more or less acceptable are taken into account when individuals evaluate a specific lie, but these factors are not taken into account when they formulate their negative evaluations of lying overall. In addition, individuals want to maintain an image of themselves as honest persons. This behavior is explained by psychologists, who maintain that people have a negative attitude toward deception, while allowing some room for justification when they tell a lie. Factors that make people more tolerant of lying include differences in the situation, the reason a lie is told, the target of the deception, whether the person is the deceiver or the deceived, and the liar's personality.

Attitudes vary across situations. For instance, lies are judged less harshly when the stakes are low and a lie has little impact. When the stakes are high and a lie can potentially have large consequences, judgments are more unforgiving. Different situations also vary in the amount of room that they leave for deception to be accepted. This is partly because of the expectations that situations inherently bring with them. In a poker game, a player is expected to bluff; but in a negotiation, people believe that using a deceptive tactic, like making false promises, is inappropriate.

One other often-mentioned factor that influences whether an attitude toward deception is more or less negative is the reason that a lie is told. For instance, one reason for telling a lie can be to save another person from harm. A large proportion of all lies are told with this apparent altruistic

intent, and this tends to make evaluations of these so-called other-oriented lies—although still tending toward the negative end of the spectrum—more favorable. Empirical research confirms that attitudes toward telling a lie are more accepting when the reasons for telling it are not self-serving, for instance, to save another from losing face or to protect his or her self-esteem.

Another factor that influences a person's attitudes toward deception is the target of the deception. Telling a lie to a friend is less accepted than telling a lie to an acquaintance, and, ironically, it seems the lies people do tell their close others are more severe, bigger lies. In romantic relationships honesty is also highly valued. Yet, comparable to the aforementioned situations, when the target of a lie is one's romantic partner, people are quick to come to the conclusion that misleading one's partner is in some situations acceptable, and is even the moral thing to do.

When a lie is told, there are always at least two sides to the story. The person telling the lie will have a different view of the situation than the person who is lied to. Whether one is the deceiver or the deceived, or the perspective one has, affects one's attitude toward deception. For those who are left to deal with the consequences of a lie told to them, attitudes are strongly negative.

Attitudes toward lying have also been found to vary according to the personality of the person who has this attitude. Although a clear relationship between specific personality characteristics and general attitudes toward lying is hard to find, some personality characteristics can predict the acceptability of different types of lies. For example, people with high self-monitoring—the ability to regulate one's self-presentation to achieve a desired appearance of oneself—have been found to judge self-serving lies more acceptable than people low on this personality variable.

Other factors that have been found to influence attitudes toward deception include age and culture. It seems children acquire an increasing appreciation for factors such as the intention of the liar. For adults, it seems that as people get older, their attitude toward telling lies becomes slightly more negative. Although research suggests that attitudes are in part learned and culturally determined, there is no hard and fast rule for different cultures when it comes to attitudes toward deception. Differences

that exist between cultures vary according to relationships, situations, and motives for the lie. An example of how cultures have been found to differ in their attitude is a lie about a good deed. Chinese children were found to view this kind of lie as a more positive act than Canadian children because they considered telling the truth about a good deed to be bragging.

### Attitude and Behavior

However, the attitudes that influence deception are mostly self-reported and therefore might be influenced by social desirability and lack of self-knowledge. There is uncertainty about whether these explicit attitudes are in accordance with actual behavior. The question remains whether a person who has a positive attitude toward deception will deceive others more often than a person who holds a more negative attitude toward deception. It can be argued that a positive attitude will benefit a liar, because lying without the anxiety and guilt stemming from a negative attitude toward deception might make the lie more difficult to detect. For the act of deceiving another person, as well as for other socially sensitive behavior, implicit attitudes might have a greater predictive power. It seems people who have positive implicit attitudes toward deception might be more inclined to engage in spontaneous deceptive behavior, but future research must find more evidence to support this statement.

People's attitudes toward deception are predominantly negative, although not unconditionally so. Even though individuals have the tendency to hold the belief that telling a lie is wrong, there is a multitude of factors that moderate this tendency. This may be for a good reason: The fact that individuals hold such a belief while recurrently and intentionally deceiving each other may make them hypocrites, but the belief that telling a lie is wrong also allows them to maintain a view of themselves as honest people.

## Deception, Characteristics of

It is commonly accepted that the word *deceive* is a success or achievement verb, such that an act of deceiving is not such unless a certain result has been achieved. In this sense, "deceive" differs from "lie" because "lie" is not a success or achievement verb. It is also commonly accepted that deception does not require language or the use of conventional signs. For example, it is possible to deceive by using only natural or causal signs, such limping or leaving a glove at the scene of a crime.

Conversely, it is also possible to deceive by failing to say something, or by making untruthful statements. Many believe that lying requires language or the use of conventional signs, or that lying requires a statement—an untruthful one. In these ways, deception also differs from lying.

### What Does Deception Involve?

Nevertheless, there remain a number of questions about what deception involve: (1) What result

*Although many philosophers speak of unintentional and intentional deception, it is more common to use the term mislead to cover all cases of propagating false beliefs, to distinguish between intentional and unintentional misleading, and to restrict the term deceive to the concept of intentional misleading. It would be unorthodox to say that "Jane deceived Susan" during their conversation, when in fact Susan simply misinterpreted what Jane said. It may even be unorthodox to say that Jane misled Susan.*

is necessary for deception? Is a new false belief required, is the maintaining of a false belief sufficient, or may a person be deceived merely by losing a true belief, or even by merely failing to gain a true belief? (2) Must deception be intentional, or may one unintentionally deceive? (3) Must a deceiver commit a certain act, or must a deceiver merely not prevent something from occurring (such as the acquisition of a false belief)? (4) Must the belief-forming agency of the deceived person be involved, or does deception occur simply in virtue of the result obtained? (5) Does deception require that the deceiver possess certain relevant knowledge or true belief, or can a deceiver deceive without possessing any relevant knowledge or true belief? (6) Is the only true deception other-deception, or is self-deception truly a form of deception?

According to R. M. Chisholm and T. D. Feehan, there is both positive and negative deception. Positive deception occurs when one acquires a false belief or continues to maintain a false belief. Negative deception occurs when one loses a true

belief (without acquiring a false belief), or fails to acquire a true belief (without acquiring a false belief). Although most are willing to accept that "causing someone to persist in a false belief can constitute deception," and hence that all positive deception is deception, most people have traditionally not been willing to accept that merely preventing a person from acquiring a true belief constitutes deception. As Chisholm and Feehan note, "... both St. Augustine and St. Thomas ... do not call it 'deception.'"

An act of concealing information or withholding information, which are distinct acts, may only be an act of keeping a person in ignorance of something. This is distinct from deceiving a person: As philosophy professor and author Thomas Carson notes, "We need a term other than 'deception' to describe cases of preventing others from learning the truth. The English expression that most closely describes this is 'keeping someone in the dark.'"

Furthermore, causing a person "to lose one of his true beliefs," as noted by Chisholm and Feehan, can be understood as an act that is distinct

from an act of deceiving that person, as observed by J. E. Mahon. Causing a person to have amnesia, for example, is not necessarily an act of deception. For this reason, Chisholm and Feehan may be erroneous to state that negative deception is, in fact, a type of deception. The result that is necessary for deception may be the acquiring or maintaining of a false belief.

According to Carson, "Deception requires some kind of intention to cause others to have false beliefs. I take it to be self-contradictory to say that someone deceived another person unintentionally." Although it is possible to speak of unintentional deception and intentional deception, it is more common to use the term *mislead* to cover all cases of producing or maintaining false beliefs, and to distinguish between intentional misleading and unintentional misleading, where "deceive" is restricted to intentional misleading. It is highly unorthodox to say that "Jane deceived Bill" in the case of Bill misinterpreting what Jane said. However, it may also be unorthodox to say that Jane misled Bill. Hence, even if "deceive" is to be understood as an intentional act, it may be that "mislead" is to also be understood as an intentional act, and that another term is required to include cases of someone being caused to inadvertently or mistakenly have or maintain a false belief.

### Deception by Commission or Omission

According to Chisholm and Feehan, there is both deception by commission and by omission. Restricting explanation to cases of what they call "positive deception," deception by commission occurs when one causes someone to acquire or maintain a false belief, and deception by omission occurs when one allows someone to acquire or maintain a false belief. As they explain, "Let us say that a man allows a certain state of affairs to occur or obtain provided only (1) he could prevent that state of affairs from occurring or obtaining and (2) he does not thus prevent it from occurring or obtaining."

A person deceives by commission if, for example, she intentionally writes a false report that is believed by those who read it. A person deceives by omission if, for example, he (not being the author) allows another person to read and believe the false report, knowing or truly believing that

it is a false report. However, it is not clear that not preventing a person from acquiring or maintaining a false belief should be considered an act of deceiving that person. Whether or not acts of allowing are morally equivalent to acts of doing, or not morally equivalent, acts of allowing are not acts of doing. It is possible to restrict the meaning of "deceive" to an act of doing. It is possible to say that "Paul allowed Bethany to be deceived by Robin's false report," without saying that "Paul deceived Bethany" (at least about the report's contents). For this reason, Chisholm and Feehan may be erroneous to claim that "deception by omission" is in fact deception. A deceiver may have to commit a certain act.

### Belief-Forming Agency

According to Gary Fuller,  $x$  only deceives  $y$  if " $x$  gets  $y$  to believe" a falsehood "by bringing about evidence on the basis of which  $y$ " believes the falsehood. The deceived person must form the false belief herself or himself; therefore, his or her belief-forming agency must be involved in the deception. To use his example, if Christopher gets Peter to believe that there are vampires in England by operating on his brain, giving him an electric shock, or by drugging him, then Christopher does not deceive Peter because Peter's belief-forming agency is not involved at all. However, if Christopher gets Peter to believe that there are vampires in England by writing a book that "proves" that vampires exist, and that book is subsequently read and believed by Peter, then Christopher deceives Peter. It is Peter who forms the false belief that vampires exist on the basis of the "evidence" assembled in Christopher's book.

The restriction of deception to cases in which the person's belief-forming agency is involved is controversial. About putative cases of deception that bypass the person's belief-forming agency, Carson has noted the following:

At present we cannot directly cause other people to have beliefs; few people consider such cases and apply or fail to apply the word *deception* to them, so there is not a basis for saying that ordinary language has clear rules and understandings about what to say in such cases.

About such hypothetical cases, opinion remains divided as to whether they should count as cases of deception. Traditionally, it was held that a deceiver could only be said to deceive another person if he knew or truly believed that the falsehood that he caused the other person to believe was false. According to several writers, however, including Bas van Frassen (1988) and Annette Barnes (1997), it is possible to deceive another person without knowing or truly believing that falsehood to be false. Van Frassen illustrates this with the following:

Suppose that a certain bridge is dangerous, and I do not know this, that I really have no evidence that makes it less likely than not, for me, that the bridge is safe. But suppose in addition that I think it would be very good for me if you believed the bridge to be safe, and I successfully persuade you to believe this falsehood. Then I have certainly deceived you, although I do not know that the information was false.

It is not clear that convincing someone of something that one neither knows to be true nor false counts as deceiving that person, at least about that thing, as opposed to one's beliefs about the thing. In van Frassen's example, I have presumably deceived you about my beliefs, but I have not necessarily deceived you about the bridge if I neither know nor truly believe that the bridge is dangerous, but simply don't know or believe either way and convince you that it is safe when it is not.

### Self-Deception and Other-Deception

Deception is traditionally divided into other-deception (or interpersonal deception) and self-deception. However, it remains an open question as to whether self-deception and other-deception are both species of a single genus of deception. There are at least two problems for the claim that self-deception is a species of deception. First, because deception requires having a false belief, self-deception would seem to require both believing a falsehood to be true, and believing the falsehood to be false. This seems paradoxical (the "static" paradox). Second, because deception is an intentional act, self-deception requires intending to get one to believe something to be

true that one believes to be false. This also seems paradoxical (the "dynamic" or "strategic" paradox).

To these paradoxes there have been two responses. Intentionalists about self-deception hold that self-deception is a species of deception. They do this by dividing the self into earlier or later selves (temporal partitioning), or into different parts (psychological partitioning). An earlier self may intend to deceive a later self and may succeed in doing so. For example, an earlier self may write a false message to a later self, and the later self may believe it to be true. The cost of this intentionalist approach is that it is not clear why deception of later selves by earlier selves, or of one part of a self by another part, should be called self-deception.

Nonintentionalists about self-deception hold that self-deception simply consists in the holding of false beliefs that are motivationally biased. False beliefs are held on the basis of desire, anxiety, or some other emotion, rather than on the basis of evidence. The cost of this nonintentionalist approach is that it is not clear why holding a false belief on the basis of some desire or emotion should be understood as deceiving oneself.

## Deception, Definitions of

The *Oxford English Dictionary* defines deception as, "To cause to believe what is false; to mislead as to a matter of fact, lead into error, impose upon, delude, 'take in.'" However, this is a rather simplified definition of deception because it refers only to those situations that involve propagating a falsehood. Deception also includes other cases, such as concealing important truthful information, allowing the hearer to continue believing a falsehood, and causing the hearer to cease to believe something that is true. Truth, here, does not mean the objective truth. It means some state of affairs that, correctly or not, the speaker believes to be true.

### Verbal and Nonverbal Deception

The following examples are all verbal deception. Consider an example of propagating a falsehood, in which a mean-spirited student seeks, during a test, to mislead his classmate who he dislikes. The student knows that his classmate needs to know what the capital of Turkey is. Knowing that it is not Istanbul, in order to cause his classmate to believe something false, he says: "Istanbul is the capital of Turkey."

An example of concealment would be a man who returns home very late because he had a long meeting in the afternoon, left work later than usual, and then went to see his girlfriend. When he gets home, his wife asks him, "Why are you so late?" In order to conceal the truth from her, he tells a half-truth, "We had a long meeting this afternoon that went on into the evening." If this scenario is slightly modified, and the wife, falsely assuming that her husband must have been working late, says, "Oh, you worked till so late today" (instead of asking him why he was late, as in the previous example), it would be an example of allowing the hearer to continue believing something false.

Now consider an example that causes the hearer to cease to believe something true: Knowing it was her 6-year-old son who emptied the cookie jar of all the cookies, she says to him, "You took the cookies, and I told you not to." The boy, wanting his mother to stop believing that he took the cookies, denies it: "I didn't take them. It wasn't me."

Deception can also be nonverbal. Nonverbal deception is prevalent in domains such as sports and the military, in which one misleads the opponent with respect to plans, strategies, and moves. A nonverbal deception in an everyday situation is of a person pretending to talk on the phone to make another person believe that he is busy.

### Deception and Self-Deception

The prevalence of deception in everyday life is much higher than is usually assumed. People regularly deceive one another for a variety of motives, which may be socially sensitive, tactful, and diplomatic, or self-serving, manipulative, and deceitful.

Deception primarily occurs because, by default, people have a truth bias. They assume that they

are being told the truth, unless there is a reason to believe otherwise. Deceivers exploit this truth bias. The satirical movie *The Invention of Lying* highlights how frequently people use deceptions in their lives. Mark, the protagonist, lives in a full-disclosure world in which the concept of lying does not exist and in which everybody always expresses their thoughts to others. Mark discovers a radically new concept that is alien to the culture in which he lives; he discovers the concept of lying.

Apart from deceiving other people, humans also deceive themselves. Self-deception means believing something to be true, even if there is strong evidence to the contrary. The benefits of self-deception are that it helps individuals maintain a positive self-image by paying less attention to their failures and emphasizing their achievements. On the other hand, too much self-deception might lead individuals to make unreasonable assumptions about themselves, which may result in bad decisions and a loss of credibility in their social world.

It is not only humans who engage in the act of deception; deception is a common phenomenon of nature. Animals and plants also engage in forms of deception to mislead conspecifics, predators, and prey for various reasons. Camouflage is a common form of deception in nature. It is a method of concealment that allows animals and plants (or other objects) to remain unnoticed by blending with the environment or by resembling something else. For example, some species of octopuses can intentionally alter their body shape and color to resemble dangerous sea snakes.

## Deception, Research on

Deception is a topic that has interested researchers in the social and behavioral sciences for decades. A multitude of studies, using a variety of techniques and research methodologies, have been conducted in an attempt to answer some important questions related to lying and deception. Some of the most common techniques used by researchers can be found in three primary domains of deception research: the study of

people's tendencies to lie and deceive, including how often, why, and in what contexts; the study of deception cues and the ability of people to detect deception in others; and the study of the outcomes and consequences of deception for both the deceiver and the deceived.

### The Tendency to Deceive

A core area of deception research focuses on the tendencies of individuals to lie and deceive others. Questions asked in this area of research include: How often do people lie? Do some people lie more frequently than others? Are certain circumstances especially conducive to deceptive behavior?

One particularly useful method for tracking how frequently individuals lie in their everyday lives is the daily diary study. Over the course of a set number of days, participants in this type of study use either a notebook or, more recently, a smart phone application to record all of their social interactions. They also report all of the times that they intentionally lied or tried to mislead someone during these interactions and their reasons for doing so. At the end of the set time period, participants turn in their diaries, which are analyzed for the frequency and types of lies that were reported.

Results of these diary studies—for example, in research by K. B. Serota, T. R. Levine, and F. J. Boster in 2010—reveal that, on average, people tend to report intentionally deceiving others quite frequently, averaging about one lie per every four social interactions (or about one to two times per day). When participants' lying tendencies are individually analyzed, however, it is revealed that a majority of the total lies reported can be accounted for by a relatively small percentage of individuals in each sample. A similar pattern of results has been found by researchers using nationally representative surveys of self-reported lying behavior. Thus, in their everyday lives, most people do not report lying very often, but a minority of the population seems to engage quite prolifically in deceptive behavior.

In addition to tracking overall lying frequency, by coding participants' descriptions of the lies that they reported, researchers are able to determine how frequently people engage in specific types of deception. For example, the majority of the lies reported in the daily diaries are self-oriented and

are thus told to promote the individual's self-interest. These include lies told to embellish personal accomplishments, make oneself seem kinder and more intelligent, and save oneself from embarrassment in social situations. However, to a much lesser extent, participants report telling other-oriented lies, usually with the intention of protecting the feelings of others.

Deception researchers frequently use survey and daily diaries in conjunction with personality assessments and other individual-difference measures to determine what types of people are more prone to lying in their everyday lives. For example, individuals who score higher on scales of manipulateness and impression management tend to report lying more frequently in their diaries. Relationship quality is perhaps the most robust predictor of everyday lying. Participants who report being involved in satisfying and enduring relationships with others tend to record fewer lies (especially self-oriented lies) than those with less satisfying relationships.

Another paradigm frequently used in the study of deceptive tendencies is the monitored social interaction. In these studies, participants are brought into a lab two at a time, where they are told to introduce themselves to one another and engage in a short conversation that is secretly videotaped. Following the interaction, the participants are taken to separate rooms, where they watch the video of their conversation and record any lies they told during the interaction. Using this method, researchers have more control over the social situation in which deception tendencies are measured than the daily diary paradigm.

Researchers can even manipulate certain aspects of the interaction to see if varying social conditions affect people's tendencies to deceive. For example, researchers have found that manipulating participants' motivations influences the number of lies that are told. Participants who are told to focus on presenting themselves as likeable or competent to their interaction partners tend to tell more lies and exaggerations than those who are not given such instructions. Additionally, participants who are told that they might be interacting with their partners again in the future tend to report telling more lies during the exchange than those who are led to believe that they will never see their partners again.

Researchers have also conducted studies showing that, in some contexts, deception can be especially prevalent. One such context is the job interview. In the job interview paradigm, participants are brought to a lab and are led to believe that they are applying for a particular job (such as a tutor or office assistant). They complete a written application containing questions about their background and academic history and take part in a mock job interview in which they are asked scripted questions regarding their job-relevant skills and experience. At the conclusion of the interview, it is revealed that the job is not real, and participants are asked to review their application and video of the interview and identify any lies that they told. The results of these studies reveal that people frequently lie in the context of job interviews, and they tend to tell lies that they think will make them appear to be a better fit for the job. For example, if the job is described as more technical in nature, participants tend to exaggerate their computer skills, whereas if the job is more academic in nature, participants are more likely to enhance their academic record.

Another context in which researchers have found deception to be especially prevalent is dating and romantic attraction. In one particular experimental paradigm, participants are provided with a picture and personality profile of a potential dating partner. They then complete a profile of themselves that they assume will be given to the potential date. When participants view the profile of a date toward whom they report being highly attracted, they tell more self-enhancing lies in their profile (e.g., exaggerating their income and intelligence) than when the potential date is not as attractive to them. Participants also alter their self-descriptions and tailor them to better match what they think their potential date is looking for in a partner.

### **Deception Cues and Detection**

A second domain of deception research centers on deception cues and the ability of individuals to detect deception in others. In order to study deception cues (behaviors that people tend to exhibit while lying) researchers induce participants to either lie or tell the truth. This can be done in a variety of ways. In some instances, participants are told to lie to an interaction partner about certain

personal facts or beliefs, such as their favorite type of music or their position on a particular political issue. In other cases, they may be presented with a visual stimulus (such as a set of pictures or a video tape) and asked to describe what they see to an experimenter in either a truthful or deceptive manner. Another common manipulation is to induce participants to cheat on a laboratory task and then have them lie to an interviewer about what they did. In all of these cases, participants are generally audio or video recorded, and following the experiment, these recordings are observed by researchers and coded for certain behavioral cues that may be indicative of deception.

From these studies—including research published in 2003 by B. M. DePaulo and colleagues—researchers have concluded that when people are being deceitful, they tend to make more negative statements and come off as less pleasant than when they are being truthful. Additionally, they tend to be more tense and anxious when lying, as is manifested by speaking more slowly and deliberately, pausing more frequently, and avoiding eye contact to a greater extent than those who are telling the truth. Such deception cues tend to be most pronounced when telling self-related lies or when lying following a transgression (such as cheating).

Deception researchers are also interested in how accurate people are in detecting deception in others. The interview paradigm is one of the most frequently used methods in this type of research. It involves bringing previously unacquainted participants into a lab two at a time and assigning one to be the “sender” and the other to be the “receiver.” The receiver asks the sender a series of questions, and the sender responds with either a truthful answer or a lie. It is the receiver’s job to determine whether each of the sender’s statements is truthful or not. At the conclusion of the interaction, the researcher tallies the number of statements that the receiver correctly identified as either truths or lies. Using this paradigm, it has been found that people are generally not much better than chance at detecting deception by the senders (i.e., they are able to correctly identify the truthfulness of just over 50 percent of the statements). Participants have been shown to be more accurate in judging truths than lies, but only because they exhibit a strong truth bias, or

tendency to judge a majority of overall statements as true.

Variations on this basic interview structure are used to test a variety of hypotheses regarding a person's ability to detect deception. One variation is to alter the medium through which senders present their statements to receivers. For example, a receiver's deception detection accuracy is relatively consistent, regardless of whether the sender's statements are transmitted in person, over video, or via audio recording. In a common video-based design, participants are presented with a series of video clips in which a sender expresses opinions on a variety of controversial political and social issues (such as capital punishment and abortion). Half of the statements reflect the real beliefs of the sender, and half reflect views that run contrary to the sender's true opinions. While watching the videos, receivers must indicate whether they think the speakers are expressing their actual opinion or a contrary opinion for each issue.

The interview paradigm has also been used to explore factors that lead to improvements in deception detection accuracy. Deception "experts," such as police officers and military personnel who have been trained in interviewing and interrogation methods, do not significantly differ from "novice" participants when it comes to differentiating truths from lies in the interview paradigm. However, some experimental manipulations have been shown to lead to slightly better detection abilities. When participants are told to focus on more indirect indicators of deception, such as whether or not the sender appears to be tense or thinking hard before responding, they are more accurate than if they are simply told to report if they think the sender is lying. Similarly, receivers who report focusing on certain cues that are reliable predictors of deception, such as slower, more deliberate speech, word repetition, and use of negative statements, tend to be more accurate than those who do not.

Because strangers have proven to be relatively unsuccessful at detecting deception in one another, researchers have begun to use longitudinal designs to see if detection accuracy improves between two individuals over time. In a longitudinal study, pairs of same-sex friends who have only known each other for a short time (generally a month or less) are recruited to participate.

Their abilities to detect deception in each other are assessed using the receiver/sender interview paradigm at an initial time period, and then again at various time periods further along in their relationship. Close friendship pairs tend to show modest improvement over time in their ability to tell true statements from false ones. Overall, however, friends tend to be just as accurate (or inaccurate) as complete strangers in detecting deception.

### Consequences of Deception

Deception researchers have also focused their attention on a third domain: the outcomes and consequences of deceptive behavior. Much of the scientific research conducted in this area falls within the context of close interpersonal relationships. The standard procedure for such studies involves instructing participants to reflect on past events in either their current or most recent romantic relationship. They are asked to think about a time when either they lied to their partner or their partner lied to them. They then report if and when the lie was discovered, describe the events that followed, and explain their and their partners' emotional reactions to the event.

Additionally, participants are usually asked to complete various questionnaires and survey items, depending on what questions the researchers hope to answer. By recording participants' scores on scales measuring such interpersonal qualities as attachment style, communication patterns, and social desirability, researchers are able to develop links between certain types of people and their responses to partner deception. For instance, people who report being securely attached to their relationship partners tend to have open communication styles and thus are able to quickly resolve issues related to deception. Those who are less securely attached, however, report hiding their feelings more frequently and avoid talking about incidences of deception with their partners. This avoidance is related to negative relational outcomes, including low relationship satisfaction and dissolution.

A few studies have explored the consequences of deception in nonrelationship contexts. In these studies, participants are induced by an experimenter to lie to a target person, and then their perceptions of themselves and the target person

are measured. An interesting finding revealed in this paradigm is that people who are experimentally instructed to lie tend to rate the target person as less trustworthy than participants who do not engage in deceptive behavior. Thus, an individual's deceptive behavior has consequences on how that person perceives others.

### Conclusion

A substantial amount of research has been conducted on the topic of deception. Using daily diary and monitored social interaction paradigms, researchers can track people's deceptive behavior both quantitatively and qualitatively. Results of studies using the interview paradigm reveal that people (both "novices" and "experts") tend to be relatively unsuccessful at detecting deception in others. Finally, a number of studies have been conducted linking people's scores on various personality-based questionnaires with how they deal with deception in their relationships. These responses to deception are shown to have different consequences on relationship satisfaction and longevity.

## Deception and Technology

Changes in technology have made deception easier to practice and more difficult to detect. Recent developments in technology have enabled people to doctor existing images and create new fake images, and to lie and deceive using new forms of interpersonal communication, including the telephone and instant messaging. New technology has also enabled users to target large numbers of people at once, as in the practices of spamming and phishing, and cognitive hacking more generally. This new form of deception is called digital deception. However, not all new forms of technology promote deception. Some new forms of technology may in fact promote honesty and self-disclosure. Furthermore, developments in technology have also led to new ways to detect attempted deception.

Photographs are taken to capture how things actually are, or at least how they actually look. To doctor them is therefore to engage in an attempt to deceive, because the image will be assumed to be true by those who see it. However, creating fake images and doctoring images is nothing new to photography. The 1860 heroic style photographic portrait of Abraham Lincoln is a composite of two photos: the head of Lincoln and the body

of a southern proslavery politician named John Calhoun. Between 1917 and 1920, two girls in Cottingley, Yorkshire, manufactured photographs of fairies in their garden that were actually photographs of paper fairies, fooling many. Josef Stalin had his political enemies removed from official photographs as though they never existed.

With computer technology and software, the doctoring and forging of images has become much easier and is much more widespread. Doctoring is so prevalent that people simply expect the photographs in magazines to be airbrushed or Photoshopped to make celebrities look younger, skinnier, or prettier; to be more tanned; to have whiter teeth; or even to be better dressed. There is no apology for this practice in the magazine industry. Nevertheless, people continue to be deceived by a doctored photograph of, for example, Oprah Winfrey's head on a skinnier white woman's body. People are also deceived by composite images in magazines and tabloid newspapers that present celebrities as being in the same place at the same time, when in fact they were the same place at different times or were never in the same place at all. Finally, people are often deceived by doctored or fake photographs used in social network profiles.

### Doctored Photographs

The doctoring of photographs in other media, however, provides more worrying examples of deception. The University of Wisconsin-Madison issued a 2001 to 2002 undergraduate application booklet featuring a cover photograph of a group of cheering white student football fans with an African American student's head (Diallo Shabazz) from a 1994 photograph that was digitally inserted into the cheering group. The doctoring was supposed to be an attempt to reflect racial diversity at the university, but after a student journalist detected it, the university admitted that it should not have done it. It was deceptive advertising about how students associate with each other at the university. More egregiously, in the 2004 presidential campaign, a photograph of John Kerry was altered to include antiwar activist Jane Fonda at his side, and the fake photograph was distributed to voters in an attempt to undermine his campaign.

Reporting on war by the broadsheet press has also included altered photographs. In March 2003, the *Los Angeles Times* published a

photograph of a British soldier telling Iraqi civilians to seek cover. The photograph had been doctored for dramatic effect: It was actually a composite of three different photographs taken within minutes of each other. When it was discovered to be a composite, the photographer was fired. The photographer could attempt to argue that the photograph was not deceptive concerning anything significant about the war. Nevertheless, it was deceptive about exactly what happened, and how, at that particular time. A complete prohibition on doctored news photographs is one way to prevent a decline into more egregious cases of doctored news photographs.

One further reason why such doctoring of photographs is of concern is that studies have shown that doctored images can implant and affect people's behavior, even if they know that they are doctored.

### Photography and Technology

The widespread doctoring and forging of images has led to the development of software that can detect doctored photographs. This can be done by detecting inconsistencies in lighting (position relative to light source and shadows), image cloning, retouching, and the particular cameras from which the photographs are taken, known as "digital ballistics." There is something of an arms race between different technologies, with "the next generation of cameras that automatically removes wrinkles (Panasonic) or ten pounds (Hewlett-Packard) at the push of a button," according to Hany Farid.

Jeffrey T. Hancock, who has written on the use of technology in deception more generally, has provided a definition of the deception to which it has given rise. Digital deception is defined as the (successful) "intentional control of information in a technologically mediated message to create a false belief in the receiver of the message." In keeping with other definitions of deception, such deception must be intentional, and must result in a false belief. The only distinction between digital deception and other forms of deception is that the message in question must be technologically mediated. The various forms of technological mediation include the telephone, e-mail, instant messaging, Twitter, Internet chat rooms, Internet message boards, and the sending and displaying

of digital images. This kind of communication is inexpensive, which allows for communication on a massive scale.

Digital deception is in turn divided by Hancock into two types. Identity-based digital deception stems from a false identity of some kind, such as an e-mail purporting to be from a bank or from a person in need of a partner for a fictitious scheme. Message-based digital deception takes place between two or more people in which the messages exchanged between the people contains lies or is deceptive (e.g., someone who is having an affair texting to say that he is working late at the office). Such deception may or may not involve a false identity.

One common form of digital deception is spamming, or the sending of unsolicited messages to large numbers of people, sometimes in the millions, especially via e-mail. Approximately two-thirds of these messages are deceptive as to the sender's identity or the subject line of the e-mail. Even if spamming is not always a case of theft, the purpose of a large number of these messages is to make money through some form of deception. Even tiny response rates lead to profits for the spammers.

### Phishing

A related form of identity-based digital deception is phishing, or “a form of social engineering in which an attacker, also known as a phisher, attempts to fraudulently retrieve legitimate users' confidential or sensitive credentials by mimicking electronic communications from a trustworthy or public organization in an automated fashion,” according to Markus Jakobsson and Steven Myers. The phisher attempts to obtain confidential information (including login names, passwords, PINs, account numbers, credit card numbers, and social security passwords), and especially financial information from a receiver in order to steal the receiver's money. The most common form of phishing is an unsolicited e-mail that lies to the receiver about some problem (that a bank account has been breached, or that an e-mail account is full), lies to the receiver about the sender's identity (the sender pretends to be a bank or a company or a university), and directs the receiver to log on to a fake Web site that mimics a true one. Phishing is also practiced in the

form of fake Web sites—Web site spoofing—and phone calls. The resulting theft of confidential information is called identity theft. Identity theft normally leads to the theft of money or important information.

Such is the sophistication of phishing deception that it is a common tactic of phishing attempts to ask receivers to give up their secure information in order to protect themselves from phishing attempts. As Markus Jakobsson has pointed out, people continue to be quite susceptible to phishing attempts:

It has been shown that the typical computer user is unable of distinguishing a valid certificate from one that is invalid or self-signed, and that he may not even detect the absence of indicators that a connection is SSL secured. [...] 23 percent of subjects completely overlooked browser based security clues such as the address bar, the status bar and the SSL lock icon, and [...] 40 percent of subjects made the wrong security decision.

An even more insidious form of phishing is to send receivers e-mails with links to Web sites, or with attachments to download, that install malware (malicious software) on computers that can allow phishers to gain access to information (e.g., spyware that logs the keys that are used).

### Identity-Based Digital Deception

Another form of identity-based digital deception is catfishing, or the inventing of fake online identities to deceive people into having romantic relationships or friendships. Even if there is no financial loss involved, such deception can be traumatic for those deceived in this way.

*Cognitive hacking* is a general term used to refer to when people at the user end of a networked computer system are targeted for a disinformation attack. One example of this would be a “pump and dump” scheme in which people publish a fake or misleading story on the Internet about a publicly traded company in order to change the stock price and buy or sell accordingly in order to make a profit.

In business and consumer contexts, there are also many forms of digital deception, especially of identity-based digital deception. At least seven

different kinds of deceptive tactics have been identified. Masking is the concealment of important relevant information about the item (not revealing that the newsletter receives money from the stocks it recommends). Dazzling is the obscuring of information regarding an item (not revealing to consumers that a free trial leads to automatic enrollment).

Decoying is the distracting of the attention of consumers from the transaction (free product offers that require revealing detailed personal information). Mimicking is the assuming of someone else's identity in order to appear legitimate (inducing users to disclose information to a fake Web site that resembles the real thing). Inventing is the making up of information (Internet auctioneers who don't actually possess the item they claim to be selling). Relabeling is describing a transaction in order to deceive (selling questionable

investments as sound ones). Double play is duping someone into believing that she or he is getting some kind of advantage (sending someone an e-mail that looks as though it were sent by mistake and contains insider information).

In addition to these forms of digital deception, some companies offer a range of deception services to customers. Alibi agencies provide alibis and excuses for people by using technology (providing a customer with a number that will function as a hotel number, complete with a "receptionist" to take the call). There are also alibi and excuse clubs in which members will lie for another member (pretend to be the person's boss and order her back to the office).

### Medium of Deception

Developments in technology have also allowed people to lie, and more generally to deceive, in

*An original photo of actress Denise Richards (left) is professionally enhanced by a Photoshop retoucher (right); her wrinkles are smoothed and her skin is softened. With the growing availability of computer technology, doctoring and forging of images has become much easier and more widespread. Modern magazine readers practically assume that celebrities will be enhanced in their photos to appear thinner, younger, or more tanned, and camera manufacturers are working on technology that automatically removes wrinkles and pounds.*

interpersonal communication in new ways. This is principally because of the ability of people to communicate with others without being physically present. The innovation of modern technology is to allow real-time communication over any distance without people being physically present or face-to-face. In the case of deception in which the identity of the deceiver is known to the deceived, Hancock and others have proposed three features of the technological medium that are relevant for determining the degree to which deception is practiced in interpersonal communication. First, there is the synchronicity of the medium, the extent to which the messages are instantaneously exchanged. Second, there is the recordability of the medium, the extent to which the interaction is documented. Third, there is the matter of whether or not the speaker and the listener are distributed or not, whether or not they share a space.

Synchronicity is relevant because lying is often unplanned and spontaneous. In a face-to-face conversation, it is often difficult to avoid responding to a searching question, and there is less time to construct an answer that avoids a lie. In non-synchronous communication, such as e-mail, one can refuse to respond to a question, or compose a response that avoids a lie. Recordability is relevant because lying is easier to detect if it is recorded. The more that the medium is recordable, such as an e-mail, the less likely people are to tell lies using that medium. The less the medium is recorded, for example a telephone conversation, the more likely people are to tell lies using that medium. The degree to which the speaker and the listener are distributed is relevant because the more they are distributed, the greater the possibility of deception ("I am working late at the office"); and the less they are distributed, the less opportunity there is for deception.

Tests conducted on subjects have revealed that people lie most frequently on the telephone (37 percent of interactions), followed by face-to-face conversations (27 percent), neither of which are (typically) recorded, and both of which are synchronous, with telephone conversations more distributed. After that, people lie more when exchanging instant messages (21 percent), which are usually not recorded for very long. Such exchanges tend to be more synchronous, with

the exchangers not copresent. Finally, people lie least over e-mail (14 percent), which is the most recordable medium, and the least synchronous. Although technology can facilitate deception (such as the telephone), it appears that technology can also constrain deception (with recordable e-mail).

Finally, there are examples of technology that promote honesty and self-disclosure, and that discourage lying and deceiving. Online diaries, chat rooms, and news groups encourage self-disclosure. For example, PostSecret is a Web site that posts online postcards sent to a P.O. box that anonymously tell secrets, such as the fact that one cheated at college. Online anonymity allows people to lose their inhibitions. People are more prone to disclosing more personal information in such text-based interactions because their attention is directed more toward their personal thoughts and feelings, and they are less concerned with how others may view their actions. However, it is also possible for imposters to join such chat rooms, deceiving others about their identity. Trolling is the practice of posing as a legitimate member of a community in order to post messages intending to disrupt the community. Pedophiles, for example, can impersonate children and teenagers in online chat rooms. More generally, social network Web sites allow for people to engage in gender deception and identity concealment, two types of category deception. Although assessment signals such as e-mail addresses and phone numbers may be more difficult to fabricate for online profiles, conventional signals such as claims to be wealthy remain easy to fabricate.

## Deception and Trust

Trust is often defined as the confident expectation that another will have one's best interests at heart, and they will take into account and/or act on those interests, even when they conflict with their interests. From an evolutionary perspective, trust is based on the ability to make accurate predictions about the intentions and behaviors of others. Inaccurate predictions of this nature can result from a genuine inaccuracy on the part of the person who trusted another or, in a significantly more damaging way, from the motivated deception of another. This type of betrayal or realization that a relationship is not what it was portrayed to be can be devastating to the self-esteem and judgmental confidence of a trusting individual and can end the relationship.

### Frequency and Focus of Deceptions in Trusting Relationships

Multiple studies have shown that trustworthiness and honesty are seen as the most desirable characteristics in a partner, regardless of the length of relationship sought, or the sex of those involved. Trustworthiness and honesty ranked higher than having an exciting personality, good health, adaptability, dependability, sense of humor, and kindness/understanding. That having been said, however, the reality is that the vast majority of close relationship partners lie to each other at some point. Research has shown that the biggest

deceptions that people undertake occur most often in the relationships with the people they trust the most. For example, studies show that lies occur in one of every 10 interactions that people have with close others in general. This ratio increases to one of every three interactions with a dating or common-law partner, and one of every two interactions that college students have with their mothers. In fact, 92 percent of people admitted that they had lied to their lovers.

When lying to those they are closest to, people most often lie in ways that benefit the liar by avoiding embarrassment, guilt, or inconvenience, though 25 percent of lies are told to benefit others by protecting their feelings or aiding in advancing their strengths or interests. Many of these lies are small or "white" lies, but when people tell serious, highly impactful lies, they tell them more often to their closest partners than to anyone else.

### Impact of Deception

Some of the impact of deception is regulated by the victim's attachment style within the relationship. For example, people with a fearful or preoccupied attachment style, and who experience higher levels of anxiety about the possibility of abandonment, are particularly vulnerable to deceptions perpetrated by close others. The intent to deceive (and the transgression that the deception is usually created to hide) is interpreted by these individuals as significantly devaluing the relationship. This results in feelings of sadness, anger, and, most important, hurt. The impact of the hurt experienced in a trust violation cannot be underestimated because research has shown that hurt feelings produce similar physical responses to actual physical pain. Ironically, this same group of insecurely attached individuals tells more lies than those whose experience has led to a more secure attachment style.

### A Deceiver's Distrust

Deception can be a vicious cycle not only in the sense that a liar may continue to lie but also because the more people lie to others, the more they perceive others as lying to them. This "deceiver's distrust" results in liars perceiving others as less honest and trustworthy than they actually are. There are at least two reasons for this erroneous belief. First, liars incorrectly assume that others are just

like them, and therefore must share their motives to deceive. Second, believing that their deceptive tendencies as shared by others serves to normalize the experience of deceiving in ways that may make the actions more understandable, socially acceptable, and more palatable to the deceiver. Ironically, by succumbing to deceiver's distrust, betrayers do not trust others based heavily on their projection of their own negative motivations and actions onto others.

### **Detecting and Discovering Deception**

Most people believe that they are more accurate "truth detectors" than they actually are. In fact, according to meta-analysis, the average person's ability to detect deception is little better than the results of flipping a coin (54 percent on average). While many people are very confident that they would be better able to tell if a close partner than a stranger were lying because of their personal, unique knowledge of him or her, the reality is that there is little difference in actual accuracy. This is due in large part to the "truth bias" that characterizes close relationships. In essence, people in close relationships trust each other, and this results in them assuming more often than not that their partner is telling the truth. In fact, not only does accuracy not improve as relationships become more trusting and intimate, it actually declines because of this tendency toward truth biasing.

McCornack and Parks's deception detection model (published in (1986) supports these findings, suggesting that as relationship partners grow closer, the assumption that the truth will be told increases, as does their confidence in their ability to detect deception in their partner. Given the prevalence of deception in even the closest relationships, this suggests that there may, for better or worse, be many lies of differing magnitudes of importance remaining undetected in peoples' lives.

While the nature of the information lied about plays a vital role in predicting relationship continuity, the method of detection also has to be taken into consideration when lying is uncovered. Unfortunately, because their ability to detect deception is little better than chance, despite the closeness and trusting nature of the relationship, individuals most often discover that

they have been deceived through others, thereby compounding the potential for hurt and embarrassment that results from being the "last to know." Research has shown that relationships are more negatively affected and forgiveness is more difficult to achieve if the liar is caught in the act, or the lie is discovered via a third party, than if the lie is confessed upon accusation. The preferred and least damaging mode of discovery is for the liar to admit to the wrongdoing without the victim having to ask or accuse. However, to whatever degree, these deceptions have a negative impact not only on the relationship as it pertains to the wrongdoing and lies at hand, but they also cast a shadow of suspicion on the past and future of the relationship in terms of how the deceptive partner's actions have been and will be monitored and interpreted. Trust, once broken, is difficult to restore.

### **Perspective Differences**

One of the reasons why trust is so difficult to restore after a betrayal has occurred is the different views of the violation that are held by the victim and perpetrator. Victims of transgressions almost always believe that the events had a serious negative impact on the relationship, damaging the sense of partnership and resulting in greater suspicion and doubt, which significantly lowers relationship satisfaction. Only about half of perpetrators, on the other hand, even acknowledge that their behavior harmed the relationship. As many as one in five perpetrators report that their betrayal may have actually improved the relationship. Even when they do acknowledge that their actions have been harmful, liars are still more likely to believe that their lies are less harmful and offensive than the target of the lies. By underestimating the harm that they have done to their victims, perpetrators are denigrating the victims' feelings, thoughts, and beliefs, as well as their ability to believe that someone who doesn't appear to understand the negativity of their actions would be motivated to refrain from hurting them again.

### **Deception and Trust Outside Intimate Relationships**

Most of these theories and studies also hold for nonintimate but highly trusting relationships,

such as working relationships or even relationships with corporate brands. When deception occurs in these circumstances, findings for the attachment style of the individual, the impact of the deception, the issues of detection and discovery, and the incongruence in perspectives between deceivers and the deceived remain consistent with findings for romantic relationships. This suggests that the core issue in deception is not how well one knows the liar but how much the liar is trusted by the target. This trust is what is damaged by deception and remains the focus of what must be restored in order for the relationship, intimate or otherwise, to continue.

### Restoring Trust After Deception

Though difficult, it is not impossible to restore trust after deception has occurred. Certainly an alignment between the victim and perpetrator's perspectives on what happened, why it happened, and the impact of the deception make forgiving and moving forward easier. It is not uncommon, however, for victims of deception to be hypervigilant about their partner's behavior, wanting to account for his or her whereabouts, and monitoring his or her interactions with others. Transparency on the part of the deceiver is essential for the rebuilding of trust in the relationship. This holds as well for nonintimate relationships people have with workplaces and corporate brands. Promises to "never do it again" are insufficient when actions are necessary to demonstrate that trust, once replaced, will be valued and respected.

## Deception Detection Accuracy

Deception detection accuracy, along with non-verbal cues, has been a mainstay of deception research in the social sciences. More than 200 deception detection experiments have been conducted to assess how accurate people are at distinguishing truthful communications from lies. The conclusion from this research is that people are typically only slightly better than chance at distinguishing truths from lies. On average, people are 54 percent accurate, compared with 50 percent accuracy expected by pure chance. People are better than chance at distinguishing truths from lies, but they are not much better than chance.

The typical deception detection experiment exposes research subjects to a series of truths and lies. Subjects are asked to make judgments about which are honest and which are lies. Deception detection accuracy is calculated as the number of correct judgments divided by the total number of judgments that the subject has made. Accuracy is typically reported as a percentage of the correct judgments averaged across both truths and lies.

Research on deception detection accuracy has been summarized in meta-analysis, showing that the findings from experiments have been remarkably consistent across studies and over time. The slightly better-than-chance outcome is reliable and consistent. Almost all studies report accuracy within 10 percentage points of this across-study average. Further, more discrepant results tend to be from small-scale studies.

Deception detection experiments typically find that people are truth biased. Truth bias is the tendency to believe a message, that is, to judge that it was honest, regardless of whether or not it is actually honest or deceptive. In experiments in which research subjects judge an equal number of truths and lies, 57 percent of messages are judged as honest. As a consequence, accuracy is typically higher for truths than for lies. Across studies, accuracy for truths is 61 percent, compared with 47 percent for lies. This difference is referred to as the “veracity effect.”

### Variables and Accuracy

A number of variables have been shown to have relatively little impact on detection accuracy. For example, it does not seem to matter who does the judging. College students perform similarly to police officers and people of other professions. Age, biological sex, and intelligence have little effect on deception detection accuracy. It also seems to matter little over which media the truths or lies are communicated. The slightly better-than-chance accuracy finding appears to hold for face-to-face communication, videotaped communication such as television, audio-only communication such as the telephone, and text-based communication such as letters, e-mail, and texting.

It also matters little how motivated the senders are, or whether or not the judge knows or has a relational history with the sender. Judge suspicion, asking probing questions, and nonverbal training do not appear to substantially affect accuracy. Instead, the slightly better-than-chance finding has been found to hold up, regardless of these other factors that might be expected to affect accuracy.

Generally, who the sender is affects accuracy more than the identity of who is judging. Some people are better liars than others. While most

people lie well most of time, there are some people who are transparent liars.

There are even larger differences in how believable people are. These differences are called “sender honest demeanor.” Some people tend to be believed by almost everyone, regardless of whether or not they are honest. There are other people who come off as less sincere, even when they are telling the truth. These differences in sender demeanor that have little to do with actual honesty may explain why deception detection accuracy tends to near chance. Alternately, the few senders who are poor liars keep accuracy from being purely chance.

Research suggests that most lies that are accurately detected are discovered over time, often well after the fact. These lies are detected either though a confession on the part of the liar, or because some evidence is discovered that shows the lie for what it is. For example, there might be some physical evidence, or some other person might contradict the lie, showing that it is false.

### Use of Evidence or Prior Knowledge

Exceptions to slightly better-than-chance accuracy often involve the use of evidence or prior knowledge. For example, if someone is asked a question and the questioner already knows the answer, but the person asked does not know that the questioner knows, then lies can be detected by comparing what is said to what is known. A variation on this approach is called the “strategic use of evidence.” This involves questioning a criminal suspect when the questioner does not tell the suspect what evidence is already known. If the suspect’s answers contradict the evidence, this suggests a lie. Then the suspect can be confronted with the relevant evidence to see if his or her story changes. In this way, a suspect can be trapped in lies. Research on the strategic use of evidence has shown that it can increase deception detection accuracy to over 80 percent.

The other path to improved lie detection is through the use of technological aids, such as the polygraph, electroencephalograph (EEG), functional magnetic resonance imaging (fMRI), or voice stress analysis. Of these, the polygraph is the most researched. Although not perfect, the polygraph usually produces more accurate deception detection than unaided lie detection. Research on

the use of EEG and FRMI is less well developed. Voice stress analysis is least promising.

A large amount of research suggests that people are typically poor lie detectors, performing only slightly better than chance. Deception detection accuracy can be improved, however, with technological aids such as polygraphs, or with the use of evidence to fact check statements.

## Deception in Different Contexts

Deception is an area of academic inquiry pertinent across a range of academic disciplines and in a variety of practical, fictional, and experimental contexts. Exploring the manifestation of deception in different contexts provides an overall understanding of the concept in its myriad forms, as a deliberate tool directed toward the accomplishment of a specific outcome, an unintentional product of a situation, or an object of analytic inquiry.

Both its production and its detection are popular areas of study, generating interest from academics across a variety of disciplines, as well as practitioners from a range of roles, including policing, motor insurance, education, and the general public. Research into deception often sits at the intersection of research and practice. Emphasis often drifts between academic analyses of the production of deceptive utterances and the investigation of deception for the purposes of generating knowledge and developing skills that can be deployed in the practical business of deception detection.

Deception may not have the same meaning in different contexts; part of understanding this area is to recognize that there are different consequences tied to the act of deception in accordance with the context, and this can alter the form that deception takes. There are a variety of assertions on the form that deception takes in different contexts. However, it is generally understood that generating a "blueprint" of deception in any particular context for the purposes of identifying or categorizing such behavior as an accurate means of establishing truth or otherwise is not a feasible or prudent prospect.

Changes in consistency during interaction, rather than specific words, phrases, or actions, may signal deception. This may take the form of inconsistency in details of an account, behaviors throughout an encounter, other prosodic cues such as tone or pitch, or the unusual presence of pausing or repetition.

The majority of research in the area of deception focuses on fields that involve professional lie-catchers such as the police, judges, and psychologists. This reflects the emphasis of research in this

*A man is arrested and led into a patrol car in Chicago, August 17, 2004. The point at which an interaction sits on a formal–informal scale affects the reasons for and investment in deceiving, such as the consequences of deception during police questioning versus a “white lie” told in a social setting.*

area on its application in policy and practice. It also reflects the emphasis of research into deception directed toward deception detection.

Much of the enthusiasm for understanding deception and its detection is driven, underpinned, and bolstered by fictional representations of high-stakes work that involves skillful deception detection, such as the television dramas *Lie to Me* and *CSI*. Many of these fictional representations are almost universally based on law enforcement or aspects of the legal system, and they retain an essence of realism by keeping a sufficient amount of their foundations loosely based in reality.

### Leakages

For the purpose of compiling a blueprint of behavior to aid in acquiring the “skill” of detecting deception, much research concentrates on deception detection rather than deception itself. However, many types of deception cues documented in

training manuals, such as averting eye gaze and hesitancy, can often be confused with the talk and behaviors of someone telling the truth under stress or in response to an incriminating question. From a research and practice perspective, it is useful to link together the reasons behind deception, the context in which the deception occurs, and the research that has been carried out about these subjects. These provide an understanding not only of the act of deception but also how this relates to the context and the way in which deception is seen and interpreted.

There is no clear and undisputed benchmark of behaviors that signify or distinguish deceptive utterances, but they generally involve some level of both verbal and nonverbal leakage of behaviors. Some behaviors are contextually dependent; for example, manifestations of deception will vary in accordance with modality.

Examples of verbal leakages include the presence of silence or pausing (which is linked to the higher cognitive load associated with generating a deceptive, rather than a truthful utterance) and specificity (the less specific the deception, the lower the cognitive load for memory recall and maintaining a logical thread when linking a series of deceptive answers, or of having to develop the deception beyond its original form). Deception in face-to-face interactions will typically involve longer sentences than in audio-only interactions such as on the telephone, and longer yet than deceptive interactions by text.

Nonverbal leakages can include rubbing one’s face, which has been attributed to the physiological effect of increased blood flow to the extremities during stress. Face-to-face interactions will also transmit visual artifacts that will offer the receiver a breadth of information different from written interaction.

Because of the *CSI* effect, many deceivers have an exaggerated expectation of the interviewer’s ability to detect deception, and therefore try and avoid producing “classic” signs of deception revealed in popular representations of lying, such as touching their noses or shifting about in their seats. This assumption can result in a marked stillness or other behavior such as prolonged pausing because of the higher cognitive load associated with deception. Ironically, these behaviors are more likely to be noticeable and therefore detected.

### **Deception in Political, Medical, and Educational Contexts**

The business of deception detection is heavily weighted toward a specific objective, such as determining if an insurance or benefits claim is genuine before issuing a payout, or whether a witness's story adds up before they are released. In this way, deception detection is part of the operational requirements of a profession, rather than simply a way to find out if someone is lying.

In some contexts, such as in politics, the focus shifts to the presence and production of deception, rather than its detection. In the arena of politics, deception or mixed messages are somewhat expected to form part of the rhetoric and tactics of a political campaign, and research in this area is heavily weighted on the linguistic structure of the rhetoric, rather than its detection. It is not unusual for the public to carry a guilt bias, considering politicians to be unpopular or untrustworthy at some point in their careers. This is dissimilar to the truth bias, such as in close relationships, in which people are more inclined to believe what the other person is saying.

In medical contexts, one way in which deception can manifest is "malingering," which is the deliberate fabrication of medical symptoms motivated by the deceiver's desire for a specific gain, such as to affect a payout in a fraudulent insurance claim, or to compel leniency from a court of law on the grounds of ill health. Deception in medical contexts can also be the result of a psychiatric disorder that causes patients to factitiously claim that they are suffering from ailments, such as Münchausen syndrome.

Other manifestations of deception in medical contexts involve patients purposefully using deception as a strategy, such as denial of their substance abuse, or arise as an unintended result of a medical problem, such as a traumatic brain injury.

Much like the subject of police interviews, the medical malingerer will not want to admit to a deception because there often are high stakes involved in the deception. However, there are considerable economic, social, and legal pressures placed on those on the receiving end of the interaction, as is reflected in the considerable volume of literature that focuses on detection of deception in these contexts.

The discipline of education applies more focus on the techniques and technologies designed to detect deception, than an examination of the ways in which it is manifested. Deception in this context primarily manifests as plagiarism, which is similarly treated to fraud. Differences in cultural backgrounds can alter students' perceptions of the seriousness of the dishonesty of plagiarism. Approaches to plagiarism detection and resulting sanctions may vary, but increasing students' awareness of plagiarism and academic dishonesty is a more effective way of reducing its prevalence than increasing sanctions.

### **Social, Moral, and Legal Spectrums**

Different contexts are underpinned by frameworks composed of diverse balances of requirements and expectations along social, moral, and legal spectrums, which may affect the composition of deceptions. The point at which the interaction sits on the institutional–noninstitutional scale, or formal–informal scale, affects the reasons for deception and therefore the investment in deceiving (such as the consequences of deception in a police interview, whereas a "white lie" told in a social setting). The way in which contextual differences affect the presence, expectation of, frequency, and manifestation of deceptions informs the study of deception detection and the underlying social, psychological, and cognitive mechanisms and behaviors associated with interaction.

Of particular interest to deception-context researchers are the interactions that sit at the high-stakes end of the spectrum, rather than low-stakes interactions such as ordinary conversation. However, research in lower-profile contexts may reveal underlying patterns, structures, and insights into the production and receipt of deceptions that may be less distorted by the background "noise" of contextual constraints and pressures and, on a more practical level, may be more easily identified. On the other hand, the additional constraints and pressures of high-stake deceptions also serve to intensify lie production in order to maximize their effectiveness and minimize the chances of detection.

Deceptions in different contexts involve different levels of perceived and actual seriousness of the consequences of both attempting to deceive and any deception being discovered. There are

numerous reasons for deception across contexts. In police interviews, for example, suspects—despite being tied to the institutional structure, legal boundaries, and high-stakes nature of the interaction—remain strongly bound to social norms and conventions within conversational interaction, and will act to protect their social persona. The power of societal acceptance and scrutiny is evident in the “name and shame” approach by police forces that publicly expose wrongdoers, asserting a shaming punishment, rather than private reprimand.

This is why minimizing the crime or presenting potential reasons for the crime in police interviews can be effective techniques for drawing out admissions of prior deception, as is illustrated by the following exchange between an officer and a suspect. Prior to this exchange, the suspect repeatedly denied the theft of videos after they were rented from a shop and not returned. It is only after the officer goes to some lengths to describe potential (relatively innocent) reasons that the suspect may have been kept from returning the videos that the suspect confesses. Once the officer has alleviated the moral and legal demands of the suspect, the suspect retracts his earlier deceptions, and reveals the reasons behind their production. The following exchange was related in E. Carter’s *Analysing Police Interviews: Laughter, Confessions, and the Tape* (2012):

Officer: All it is, I mean, for the sake of two video games and computer game, I mean I dunno if you forgot to return them, or you’ve passed them on to somebody else, or you’ve just thought, “well, you know, I’ll keep these; I’m going on holiday fairly soon . . . ?”

Officer: It could have been a misunderstanding, right, so I’m asking you now, is it a misunderstanding, have you taken those videos out and not returned them for whatever reason, best known to yourself, and if you have, are you prepared to take them back, to give them back?

Suspect: Yes, I will take them back.

### **Uncontrollable or Purposeful Deception**

The motives for deception can vary, altering its manifestation and increasing the difficulty of

categorizing its form in each context. Gaining a full understanding of why someone has produced a deceptive account is potentially impossible. This is because of several factors, including the unwillingness of the deceiver to provide such an account, or their inability reflect, make sense of, and verbalize an internal and potentially habitual response.

This leads to the discussion of purposeful and uncontrollable deception. Deception occurs when there is some sanction or penalty that is avoided by the act of deception. Evading a social sanction can take the form of a face-saving act among social and family groups, such as opting to not respond honestly about a friend’s haircut. It can also take the form of avoiding the violation of social norms, such as hiding one’s discriminatory or prejudicial opinions when among a group of peers that may not share such views. Deception can also be employed to avoid a penal, rather than a social sanction; these cases may involve higher-stake deceptions, and therefore a stronger motivation to deceive, such as avoiding a criminal record or prison sentence.

Research also reveals that the act of deception requires a more cognitive load than an emotional one, so engaging in the emotional aspects of a situation will yield less obvious indicators of deception than answering questions that require recollection of particular elements of a story. Methods used by the police, such as asking a suspect to recount the events of the day in question and then repeat that account in reverse order, engage with this theory by applying a cognitive load, which is difficult to maintain if the story is false.

Similarly, an attempt to draw an admission of deceit or halt deceptive utterances by appealing to a deceiver’s sense of moral duty to tell the truth, or a duty to protect those falsely accused, would have less of an impact than requiring the deceiver to recall several interlinking aspects of their fabricated account, therefore making their lie untenable.

Deception is not the sole preserve of the interviewed, questioned, or examined; it is also often used by academics as a tool of research design in many social scientific disciplines such as psychology, sociology, and criminology. It is often integral to research in the social sciences to deceive the participant of the true nature of the research in

order to protect the study's integrity and achieve responses that are untainted by the research objective. Deception in research is often closely linked with research ethics and debates surrounding informed consent.

## Deception in Research Design

Deception in research design, or the intentional misleading of participants about the real method or objective of a study, is both commonly used and controversial. Deception has a long scientific history in various academic fields, and there are

several types of deception still in use today. Many researchers argue that deception is essential to scientific research, yet many critics have serious ethical and methodological concerns about its use and advocate against it. Although reliance on deceptive research has declined in some fields, it remains a central component of a larger societal discussion about the ethical boundaries of scientific advancement.

Deceptive research can take many forms, and is not always intentional. Types of deception include giving erroneous information or concealing information, not following through on promises, providing inaccurate feedback, misrepresenting one's identity, and the use of surreptitious surveillance, confederates, and placebos. Each case of deception encompasses a distinct set of legal and ethical concerns, and a number of governmental, international, and organizational entities have established ethical guidelines for conducting this research. A ubiquitous component of these guidelines is a condition that participants must give informed consent before participating in a study. In the United States, when situations arise in which insufficient information may be given to subject volunteers and deception is suspected, institutional review boards assess the ethical acceptability of a study.

### Medical Research and Placebos

Some academic fields have independently elected to prohibit the use of deception altogether. Experimental economists, for instance, generally refrain from using it and are often outspoken critics. In contrast, medicine and psychology have frequently used deceptive techniques in the past and continue to employ such techniques today. In medical research, deception usually takes the form of placebo studies. Placebo studies test the effectiveness of medications and medical therapies by comparing the outcome of an experimental group given a medical treatment to a group given a pharmacologically ineffective placebo treatment. The purpose of the placebo is to make participants in the control group believe that they are receiving a medical treatment, even though they are not.

There is a consensus among medical researchers, federal agencies, and review boards that the placebo-controlled study is the most effective means

of testing new treatments and therapies. However, modern ethical codes of medical research mandate that when an effective treatment for a condition is available, it cannot be withheld from research participants, even if they consent to placement in a placebo group. These ethical codes of conduct were partly established in response to historical cases of ethical misconduct involving the use of deception, such as in the Tuskegee Syphilis Study initiated in 1931.

Conducted by the Public Health Service to track the progression of untreated syphilis, the study followed the lives of hundreds of black men who had contracted the disease. In the absence of ethical regulations at the time, researchers continued to observe the catastrophic effects of the disease, even after a successful treatment (penicillin) was discovered in 1943. While obvious instances of abuse like this would be forbidden by ethical codes today, there is disagreement in some current medical studies about whether effective therapies exist and if they should be used in place of the placebos currently administered.

Some researchers also contend that because placebos can have significant effects on a participant, a placebo should not be characterized as a control condition at all, but instead, a condition representing alternative placebo-induced effects. Some proponents of placebos maintain that barring their use has adverse methodological consequences because it hinders the ability of researchers to develop treatments that are more effective. Thus, well-intended efforts to provide all participants with effective treatments might only be succeeding in providing all participants with less effective treatments overall. Despite strongly divergent perspectives on the ethics of their use, placebos are still considered an important methodological tool in biomedical research.

### Psychological Research

Psychology has perhaps the most extensive tradition of deceptive research, and the ethical acceptability of using deception poses a contentious debate. In the 1930s, pioneering social psychologist Kurt Lewin began using experimental methods as opposed to the naturalistic observations and attitudinal measurements most commonly used in earlier studies. Lewin and his students utilized deception in order to manipulate

independent variables in the experimental situations they created. Because of the control for extraneous variables that deception provided, many social psychologists followed this tradition, and deceptive research saw a dramatic rise in the 1950s. As deception in research design became commonplace by the 1970s, some researchers began challenging its ethical validity.

In 1964, Diana Baumrind published a critique of Stanley Milgram's use of deception in his landmark study of obedience, and a dispute emerged about potentially harmful effects of deceptive research techniques—an argument that continues today. Proponents of deception in psychological research typically argue that it is, at times, necessary to mislead or misinform participants about the real purpose of a study in order to elicit behavior that is more genuine. For instance, participants may alter their behavior in an experiment if they are under the impression that they are being observed or analyzed. Critics counter that misleading or misinforming participants undermines informed consent procedures. Because experimenters do not fully inform subject volunteers about an experiment beforehand, the experimenter is lying to the participant—an outright morally reprehensible act. Furthermore, experiments posing a risk of pain or indignity are inappropriate candidates for deceptive designs because of the fraudulent means by which informed consent is attained.

Yet, ethical disputes about deception are most often characterized in terms of utility—a question of whether the benefits of deception outweigh the costs. In addition to informed consent, the ethical standards of the American Psychological Association (APA), which govern most behavioral research, affirms that the use of deceptive techniques is not justified unless a study demonstrates significant educational or applied value, and researchers illustrate that nondeceptive measures could not have been taken. Advocates of deception argue that deceptive research designs have provided a considerable amount of valuable scientific knowledge from which society has greatly benefited. For example, Milgram's study of obedience transformed the study of personality and social psychology and advanced scientific conceptions of obedience. Proponents claim that this would not have been possible without

the experimental advantages that deceptive techniques provide scientific investigation.

Detractors claim that deceptive experiments with higher risks of injury to participants are a strong utilitarian argument against using deception, and these risks of injury should be weighed against possible benefits. Critics also contend that participants in deceptive research studies are especially vulnerable to feelings of anger, disillusionment, and anxiety as a result of an inherent violation of trust between a participant and an experimenter. The APA requires that experimenters debrief a participant about deception by providing a true account of the intentions of a study and divulging any information that was previously withheld. This additional requirement is designed to alleviate any anxiety that a participant may have suffered and to re-establish trust between experimenter and the participant.

On a more pragmatic level, arguments about methodological implications do not focus on the potential harm or costs of deception, but rather deliberate whether deception enhances the methodological integrity of social experiments. Critics argue that deception undermines experimental control by making participants suspicious of research and researchers, which in turn causes participants to atypically act in research settings. Instead of the intended consequence of eliciting naturalistic behaviors in the laboratory, the expectation of deception leads people to behave in ways that they normally would not. Some investigators have sought to verify these claims, and their results suggest that participants who have been deceived in the past are more likely to be distrustful of experimental designs in the future. Yet, evidence of this distrust spreading from an individual participant in a deception study to society as a whole in the form of public skepticism has yielded inconclusive results.

In contrast, other studies examining the attitudes of people who participated in deceptive experiments found that participants rated the experience more favorably than people who participated in experiments that did not use deception. Nevertheless, research also suggests that deceptive studies that risk harm or an invasion of privacy are viewed as more unethical than studies examining innocuous behavior. Proponents of deception emphasize not only the educational

gains it affords the scientific community, but also highlight studies suggesting that participants experience more educational benefits from participating in deceptive experiments. These researchers cite the results of studies that highlight favorable experiences of deceived participants as a persuasive justification that the costs of deception are minimal or nonexistent.

Although many modern opponents of deception in both psychology and medicine accept its prevalence, they advocate for stricter efforts to regulate its use. Critics of psychological research using deception claim that debriefing is not an effective countermeasure for the potential risk, and that ambiguity in current APA guidelines leads to inconsistent interpretations of what constitutes deception. Critics of deception in medical research claim that placebos should only be used in circumstances in which effective treatments are not available, and that current regulations do not clearly define these circumstances. Thus, there are appeals in both fields for the operationalization of ethical guidelines into clearer and more precise directives. These recommendations aim to maximize the potential gains of deception in research while mitigating unwanted consequences.

Deception in research has a dubious and, at times, contemptible history. Even though deceptive research has become more highly regulated, it continues to be a contentious issue among academics of various disciplines.

## Deception Motives

While lying is pervasive in our society, people rarely engage in deception when the truth would be acceptable. The reason for this is simple: Telling the truth is easier because it requires no explanation. Lying, on the other hand, requires justification, not only to the target (should the lie be discovered), but also to the self in order to engage in the deception in the first place. Psychopathy aside, people tend to lie and deceive primarily when truth-telling is perceived to interfere with the attainment of meaningful personal and interpersonal goals.

The specific goals that can be thwarted by honesty are many and varied, however, they can generally be characterized by six overarching motives: being polite or socially acceptable, protecting others, protecting relationships, protecting the self, promoting the self, and deliberately hurting others.

### Polite Lies

The imperative to be polite is ingrained in many societies. This social imperative breeds what are known as "polite lies." These lies are intended to be tactful, and both the target and the liar are aware that they are untrue. For example, in North America, the socially acceptable response to the question "How are you?" is "Fine, thank you" regardless of whether or not one is actually fine. If a person responds to this question with a detailed description of his or her lousy day, the questioner will often attempt to change the topic of discussion or avoid further discussion.

Socially acceptable lies such as "You look wonderful" or "I'm so glad you stopped by" forestall any further discussion, and give the questioners the opportunity to feel positively about themselves while allowing the liars to maintain their positions as nice people. In many societies, the punishment for not telling these socially sanctioned lies is more harsh than the consequences for those telling the polite lie who are then found out. Avoiding social ostracism, one of the most common responses to telling unpopular truths, is a powerful motivator for liars to tell polite lies. In addition, polite lies have a direct benefit to the liar of not having to reveal personal information, should he or she feel uncomfortable doing so. Polite lies then serve the dual purpose of avoiding social ostracism from telling too much truth and enabling the liar to maintain his or her privacy, should that be desired.

### Protecting Others

Other lies are told in the belief that the target will be protected, helped, or benefitted by the lie. These are commonly known as "benevolent lies" or "altruistic lies." These prosocial lies, such as overpraising another with the intent of increasing his or her self-esteem, operate on the principle of self-fulfilling prophecies. The liar may believe that if the target is told that he or she is better than in the reality, then the target may begin to change his or her behavior, outlook, and/or beliefs, and start to actually bring them in line with the well-meaning untruth.

Another type of prosocial lie is lying to someone who intends to harm others. For example, if a family member is abused by their spouse, lying to the abuser by claiming no knowledge of the

victim's whereabouts would be considered prosocial, with the intent to protect another. As with polite lies, the consequences of not telling these prosocial, other-protective lies would be serious, potentially resulting in the truth-teller being held responsible or blamed for any further abuse experienced by the victim. In essence, other-motivated protection-based deception can sometimes be viewed as socially supported and relationally beneficial.

### Protecting the Self

Understandably, not all lies are intended to protect others. Lies that are motivated by self-protection generally involve a poor choice or unintended negative experience that individuals feel compelled to hide or explain in such a way that their positive sense of self is protected. In its more extreme forms, people are often motivated

to lie about their actions in order to avoid punishment for wrongdoing (e.g., "It wasn't me who stole it") or put a more positive spin on why it happened (e.g., "I only took it to pay for my mother's surgery"). Trying to make an intentional wrongdoing appear as though it were an accident or an unexpected byproduct of a more positively intentioned act is one of the biggest lies that people tell in order to protect their sense of themselves as good people and to avoid the consequences, should their actions be found to be deliberate or careless.

### Protecting the Relationship

Many lies cross the boundaries between protecting the self and protecting the other, especially when the liar and target share a close relationship. One of the more common forms of relationship-protective lies are those designed to avoid

*Some lies are told in order to promote the self (such as in a job setting in order to create a more positive impression), while some lies are told in an effort to protect the self (such as saying, "no thanks, I'm full" when offered food, while the truth is actually a dislike of what is offered). Other motivations for lying are to be polite, protect a relationship, protect others, or deliberately hurt others.*

conflict. For example, when people are facing a potential conflict with a friend, one which they realize they have little hope of winning, people often lie to avoid the conflict. They either pretend to go along with the friend's belief or conjure up a plausible, though still untrue version of the story that will allow them to hold their own in the conflict.

Relationship-protective deception can be beneficial to a relationship, but under some circumstances, it can further complicate matters. For example, conflict avoidance may reduce the stress on a relationship in the moment, but over time, when the conflictive issues are consistently avoided, problems simply are not resolved. This is detrimental to the relationship in the long run. In addition, self-protective lies are often told under the guise of protecting the relationship. A classic example of this grey area of relationship-protective lies can be found in stories of infidelity. Often, the unfaithful spouse claims to have lied to his or her partner in order to protect him or her from being hurt. While this may not be completely untrue, a good deal of the motivation for lying about cheating stems from a desire to protect the self from punishment or censure for bad behavior. This type of self-focused deception is generally perceived as more negative than other-focused lies because the liar is acting for selfish reasons, rather than for the positive protection of the relationship.

### **Promoting the Self**

Not only can people lie to protect themselves, they are also motivated to lie in order to promote themselves. This is most often found in the business sector and in close relationships. What these two situations have in common is that a positive first impression is a vital part of any successful relationship, be it personal or professional. In an ideal world, that impression would be based on the reality of who people really are. Some people either lack the positive impression or confidence that they naturally project a positive image. In these cases, many people will create a false, more positive impression of themselves in order to gain the favor and approval of others.

For example, when applying for a new job, many people put a significantly more positive spin on their resume and job experience than reality

can support. They will inflate their role in previous successes and/or overestimate the level of skills they possess. Sadly, this tactic often backfires when they are hired and end up taking on projects for which they are unprepared to complete. In this sense, the confidence they project is not related to their actual capabilities, but successfully serves to give the impression that they were the right hire for the job. Similarly, when meeting potential new relationship partners, people also attempt to "put their best foot forward" by using self-promotional lies. For example, men tend to overstate their income and the importance of their jobs. Women trying to make a more positive first impression on a date will lie about their age, education level, and the type of relationship they are interested in pursuing. All of these lies, which are seemingly easily uncovered, are designed to create a more positive impression of the self than the individual believes exists in reality. The two-pronged consequences of more positive self-perception and a potential increase in external rewards such as a better job, higher paycheck, or more attractive mate make self-promotional lies highly tempting to many people.

### **Deliberately Hurting Others**

Antisocial or malicious lies are considered the most serious and intentionally hurtful form of lying. These lies are used to deliberately hurt and/or discredit the target. While the liar may derive some pleasure from the pain experienced by the target, the primary goal of this type of lie is to deliberately cause the hurt. Often, these malicious lies stem from jealousy or the liar's sense of inadequacy. For example, a coworker may falsely accuse a person of sharing insider information to a competitor.

The point of the lie is to cause the employer to become suspicious of an employee's activities, creating stress and distrust in the workplace. If the accusations cannot be disproved, this potentially leads to the employee being fired and shamed in front of his or her colleagues. This need to hurt may stem from dissatisfaction in the liar's life, or jealousy over what the target has that the liar does not, or may be used as revenge to right a perceived wrong, such as when a coworker was promoted over the liar without what the liar feels is a justifiable reason. Whatever the ultimate reason

for the lie, the goal is the same—deliberately causing hurt by sharing untruths.

While these categories neatly break down the potential reasons for liars to tell their untruths, there are at least two challenges in discerning the true motives of liars. Both are linked to the fact that the only ones who have access to the motives of liars are the liars themselves. First, regardless of their true motives, when asked about their lies, liars tend to try to justify their motivations by linking them to larger, positive, and broadly held values. Liars suggest that their lies are morally acceptable because they are in the best interest of the target or the relationship with the target. They may spin their actions in terms of the “rightness” of the lie in the big picture. While this analysis suggests that liars are consciously and deliberately misrepresenting the motives for their untruths, a second issue in determining motive involves the extent to which liars are even aware of why they are lying. It is only when liars have been caught in their untruths that they even begin to evaluate what they have done and why. The veracity of the motives that liars ascribe to their actions must be weighed against the conscious or self-conscious desire to present as having a “good” reason to tell untruths.

## Defense Academy for Credibility Assessment

The Defense Academy for Credibility Assessment (DACA) is the former title of the federal government agency that was formally redesignated the National Center for Credibility Assessment (NCCA) in 2010. The NCCA is the government agency that is responsible for the provision of training and education related to the use and application of psychophysiological detection of deception (PDD), which is more commonly known and referred to as the polygraph.

The change in the NCCA’s title is not unexpected given that the agency has experienced a great deal of change during the course of its existence. Since its origination, the NCCA has been housed under the Department of Defense (DOD), the Defense Security Service (DSS), and the Defense Intelligence Agency (DIA). Before acquiring its current title, the NCCA had officially been known as the U.S. Army Polygraph School (USAPS), the Department of Defense Polygraph Institute (DoDPI), and the Defense Academy for Credibility Assessment (DACA).

### Mission of the Agency

While the alignment and title of the NCCA may have changed over time, the mission of the agency has remained largely the same. More specifically, the mission of the NCCA is to provide federal government agencies and their employees with the educational programs and the credibility assessment tools that they need in order to effectively protect and secure the interests, property, and citizens of the United States. It is believed that the NCCA’s role in providing education and training regarding credibility assessment techniques is a critical part of ensuring the achievement of this protective mission.

In order to accomplish its mission, the NCCA is charged with a variety of duties related to its core credibility assessment function. The nature and scope of these duties have dramatically changed over time as the types of threats presumed to exist have changed, the tactics and stratagems used to discover deception have evolved, and the technologies related to credibility assessment and deception identification have developed and advanced.

The NCCA was originally charged with providing basic polygraph training for employees of various federal government agencies. While this vocational training role has been maintained, the set of duties assigned to the NCCA has dramatically expanded. Currently, these duties include a compliance and oversight role, an advisory and consultative duty, and a research and testing expectation, in addition to the provision of both initial and ongoing training and graduate level educational programs.

While education remains the primary duty of the NCCA, in some of its most recent initiatives, its regulatory and research roles have demonstrated greater significance and visibility. Near the close of 20th century, the NCCA developed a Quality Assurance Program (QAP) for federal PDD programs and PDD technicians. This program is mandatory for some federal polygraph programs, while many other federal agencies with polygraph programs have voluntarily agreed to comply with its mandates. The QAP established standards for federal PDD programs and provides a means by which periodic inspections of federal PDD programs can occur. In another important development, near the end of the 1990s, the NCCA's existing research agenda was rejuvenated and strengthened. The renewed research agenda included the provision of additional funding for relevant credibility assessment research and an increased focus on the creation of collaborative PDD research agendas with academic institutions and industrial organizations.

As the NCCA has grown and developed, its scope and influence have expanded beyond its traditional target audience. While the NCCA was traditionally associated with the provision of PDD training for federal agencies and personnel, it does not exclusively limit the training that it provides to this specific population. The NCCA has created an alternative admissions process through which members of state or local law enforcement agencies can gain admission and receive credibility assessment training. Further, the NCCA involves itself with research and training that is of substantive concern to both government agencies and private industry. While PDD techniques are used extensively within certain government agencies, they are also widely employed within the private sector. As a result, much of the research

conducted by the NCCA may ultimately influence PDD policies and practices as they are currently employed within both government and private industry.

It is likely that the future will see further revisions to the mission and duties associated with the NCCA. An increased focus on foreign and domestic terrorism and the related increase in the importance of intelligence-gathering will likely increase the NCCA's role in the counterintelligence field. While counterintelligence has always been a part of the NCCA's mission, it will likely take on increasing significance and play a more prominent role in the agency's future.

In addition, advancing technologies and future innovations in the field of credibility assessment will likely result in significant changes in the way in which the NCCA undertakes its educational and research duties. Ongoing revisions of this nature are expected if the NCCA is to continue providing law enforcement and intelligence agencies and their employees with relevant training and access to the most current credibility assessment tools.

## Deniability

The definition of “deniability” seems simple on its face as a combination of the ability or capability to be denied, and this was how it was initially used in the English vernacular. Early word usage did not necessarily connote deception or the prospect of deceiving, but reflected a range of possible associations, such as candor or humility, as in poet Samuel Taylor Coleridge’s phrase, “Beyond all deniability, I am a coward in giving pain.” The popularization of the word in the 1970s, however, produced two new connotations directly related to deception: (1) the possibility of denying a “discreditable action” (*Oxford English Dictionary*) and (2) deniability as a function of “being officially uninformed” (*Merriam-Webster Dictionary*).

These new associations have meant that “deniability” has come to be used almost exclusively in the context of lying (the potential to lie without being perceived as lying), and is almost always combined with the word *plausible* to highlight the potential of the denial to be effective, that is, to deceive and manipulate the impressions of others. Any potential misdeed is deniable. For example, throwing a rock and breaking a glass window in front of a crowd is a deniable act, but is not likely believable or plausible.

The term *plausible deniability* was popularized when it was used to describe the specific doctrine of the Central Intelligence Agency (CIA), as revealed by the Church Committee, but this term was quickly extended to characterize similar behavior in political, governmental, and legal spheres in which public officials sought to escape accountability for their actions or actions of their subordinates. More recently, plausible deniability has been broadened to the interpersonal realm to help conceptualize forms of communication (e.g., indirect speech) that might involve deception or

evasion and to understand how potentially unacceptable social attitudes are masked or denied (e.g., racism).

### Governmental and Presidential Behavior

In 1974, the Church Committee of the U.S. Senate used the term *plausible denial* to refer to the government doctrine by which the president could disavow knowledge of CIA plots against various foreign leaders, most notably Fidel Castro. By being kept uninvolved and uninformed, the president could deny any awareness of these activities. If the president was not perceived to be involved, then the entire nation would, by extension, seem to be uninvolved and this perception would not only forestall blame but also prevent any potential for retaliation. The Church Committee outlined a number of important fatal flaws in the logic of this strategy.

In a subsequent governmental invocation of plausible deniability, Admiral John Poindexter used the term during the Iran-Contra Affair. While his usage retained the idea of keeping the president free of information that might be discreditable, he used it more narrowly to suggest that it referred to protecting the president, not the entire government or the American people, from the knowledge of the illegal diversion of funds, which is why Poindexter explained that he took personal responsibility for authorizing the movement of money from Iranian arms sales to the Contras.

In this context of government and political actions, plausible deniability might be seen as a variety of propaganda, a kind of official, preemptive lying, through which a specific narrative is crafted to create a particular impression that either obscures or refutes the actual discreditable actions and behavior of politicians and governments. Douglas Walton suggests that this works by escaping the burden of proof by “putting forward a proposition that a target respondent (or audience) is meant to accept, while building in a defense to shield off the need to respond to any request to justify (or give evidence to support) the proposition queried by the respondent.” These deniability-serving government narratives, according to David Bogen and Michael Lynch, have the wider potential to distort or obscure important details surrounding actual U.S. and government history.

In a sense, plausible deniability is unique in the world of deception because it involves a recognition that an action is wrong in advance of its execution, and that one must have contingency plans (in the form of excuses) to save face or avoid retaliation, if the discreditable act is discovered. One must deceive in advance to avoid the revelation of a more damaging instance of deception.

### Indirect Speech

In the context of linguistics, Steven Pinker and his colleagues have placed plausible deniability at the center of their theory regarding the function of indirect speech (or conveying the spoken information in a manner that is not explicit). Pinker and colleagues posit the strategic speaker theory, in which, because the individual does not know the identification (and therefore the predispositions or thoughts) of his or her interlocutor/audience, the speaker has to be cautious in what he or she says. The identification problem has particular gravity in social contexts that might exact certain economic or social costs, such as attempting a veiled bribe, sexual advance, covert threat, polite request, or solicitation for money.

Indirect speech permits plausible deniability in such instances because the speaker can always assert that his or her ambiguous statements were misunderstood, when they were correctly understood. Pinker and James J. Lee maintain, "Indirect speech allows plausible deniability of a breach of a relationship type and thus avoids the aversive social and emotional consequences that would be triggered by such a breach." Marina Terkourafic and other critics of this theory have argued that cooperation better accounts for indirect speech than deniability, but it remains an important theory.

### Racism and Other Biases

Modern racism might also be seen as a form of plausible deniability around the potential disavowal of racial bias, while simultaneously holding or expressing racial prejudices. (This use of deniability might easily be extended to illuminate other forms of bias.) The theory of symbolic (or modern) racism holds that while it is no longer socially acceptable to openly express racist attitudes, people still hold racial prejudices and express these in veiled symbolic statements about racial groups.

James H. Liu and Duncan Mills found four factors underlying modern racism that relate to plausible deniability:

1. Minority group members are criticized for specific misdeeds that violate traditional majority group values.
2. The specific criticism against the minority group member(s) is qualified.
3. Majority group values are affirmed in the process of criticizing the minority and warranting this critique.
4. Racism or racist intent is denied.

Missing from this analysis is the possibility that symbolic racism might be used as a kind of social attunement strategy to assess and adjust to the attitudes of others. The symbolic statements about an out-group might be hazarded or floated to gauge the degree of agreement with an interlocutor. High levels of agreement would reinforce one's implicit bias, and low levels of agreement could lead to denial of, but even possibly a change in that bias.

Future research would benefit from a broader focus on the role of plausible deniability in biases and biased statements more generally. It would also be useful to have a better understanding of plausible deniability as an impression management, social attunement, and/or relationship formation strategy.

## Denial

The term *denial* has several meanings in the English language, including refutation, refusal, and renunciation. In the varied disciplines of psychology, denial closely relates to self-deception. In the context of psychology, denial encompasses several means for a person to protect the self from any number of threats, imagined or real.

When a person experiences a threat, denying the threat may afford the person time to appraise its meaning and severity before reacting to it. During denial, the perceived time lag from perceived threat to the actual perception of discomfort places denial in the category of self-defense and sometimes in the category of coping. Psychological science has shown that denial more closely relates to a self-protective motive than to a coping skill or strategy. Nonetheless, researchers garner empirical support for denial, and thus it is no longer merely a notion of 20th-century esoteric conjecture.

### Freud and Kübler-Ross's Concepts of Denial

In the early 20th century, denial was central to the writings of Sigmund Freud; it was one of several of his professed psychological defense mechanisms. From this view, denial was potentially dangerous psychologically because a person refused to accept what had occurred in the observable, physical reality as the truth. Denial was a person's blatant disregard for what others could verify as real. For instance, when diagnosed with a terminal illness, the person refuses to believe that life will continue as it was prior to the illness.

Freud believed that denial was one of several defensive reactions to threat that manifested in adulthood from repressed urges and conflicts thought to have occurred in a person's childhood. Freud thought of denial, among other defensive reactions to threat, as a conflict between a person's unconscious motive to maintain pleasure and the idealistic motive to maintain righteousness, that is, to do what is right in the eyes of others. The disruption of hedonic balance sometimes triggers a defense, such as denial in which a person may think, “This is not happening.”

In Freud's view, psychological negation—denial—included anything from the refusal by a person to accept a character in a dream as a symbol of one's mother, to the failure by individuals to accept their current emotional states as unpleasant. In denial, someone attempted, albeit unknowingly, to reconcile the discrepancy between what the person desired with the reality of the actual occurrence or with others' expectations. In sum, Freud's notion of denial is broad. It occurred beneath a person's awareness; hence, the psychoanalytic therapist would attempt to facilitate the person through the acceptance of that which the person defensively denied.

Later in the 20th century, Elisabeth Kübler-Ross narrowed the scope of denial to personal loss, such as during bereavement. Among her five stages of grieving, she posited denial to occur first. When dealing with the loss of a close relation, Kübler-Ross suggested that individuals implicitly or explicitly engage in a process of refusing to accept the fact of loss, “This can't be happening to me!” The passage of a person from life to death often provokes intense feelings of sadness, and even trauma. From this view, denial occurs naturally, consequent to someone or something perceived as gone, a barrier between intense discomfort and the person's sense of self.

In addition to the focus on bereavement, Kübler-Ross's notion of denial included the surprise, shock, and suddenness of the change or loss to a person. The shock could pertain not only to news of the loss of someone or something, but also about one's self, such as compromised health status. As an initial emotional response to loss, denial affords a means to create a space between the stability of the known past and the uncertainty of the present and future. Similar to Freud's view, the discrepancy

that arises from the comfort of knowing that someone is alive and the discomfort in knowing that a person has died provokes denial, ostensibly as a means to shield one's self from intense unpleasant feelings. Denial often includes a perceptual time lag for a person. Distorted temporal perceptions provide a psychological platform for a person to attempt to reconcile the emotional contrast.

### Modern Concepts of Denial

The modern conceptualization of denial includes a broad range of phenomena, many of which have been the subject of empirical scrutiny. Personality and social psychology research preserves the theme of denial: Individuals refuse to accept threatening information as evident, whether it is real or imaginary. A common paradigm of such research includes presenting to a person negative feedback or some form of unflattering information that directly relates to the person's self-concept, such as to their sense of self-worth and self-esteem.

For instance, results from a meta-analysis suggest that when under a perceived threat such as failing an exam, many individuals attribute the failure to external sources, blaming the difficulty of the exam, rather than their ineptitude or lack of study. When faced with self-enhancing or self-affirming situations, such as doing well on an exam, they may attribute the success to their competence or intelligence, regardless of whether or not such competence is veridical. Both kinds of attributions are a form of denial. From this view, individuals tend to maintain a positive view of their self, are motivated to reduce discrepancies that challenge their positive self-views, and are motivated to maintain self-consistency when faced with self-challenging information.

Social and personality psychology research has posited and examined a wide range of phenomena that fit within the framework of denial. An important distinction in such research has emphasized the conceptual and practical relatedness of denial to coping. Among the most basic psychological processes that set denial apart from coping is a person's observable adherence to reality. A person may deny reality in a number of ways; however, coping implies an appraisal of a presumably negative situation.

In response to a personal threat such as an insult, a person in denial would be likely to avoid

the personal relevance of the threatening stimulus by thinking, "He wasn't talking to me." On the other hand, in coping, a person would be likely to acknowledge the personal relevance and manage the threatening stimulus, "He was upset and didn't mean to hurt me." A convergent aspect of denial and many coping strategies is that, in response to a personal threat, each may at times help a person manage negativity, and each may at times fail to do so. Like denial, coping does not always work; however, like coping, denial is sometimes an effective means to deal with negativity.

Denial and coping overlap in the case of avoidant coping: a reaction to negativity that prompts a person to maintain physical or psychological distance from the threatening stimulus. Another point of convergence concerns the information on which a person focuses. Whereas active coping primarily concerns a person focusing on a problem to be solved and the goals needed to solve it, both coping and denial can focus on the emotions to be dealt with, like diminishing negativity. Denial can sometimes be a form of emotion-focused coping, such as keeping oneself at a distance from potential or actual sources of threat, or ignoring that a problem exists at all.

Similarly, research has shown that some individuals are more prone to denial than others. Some evidence suggests that dispositional pessimism, a generally negative view of the self and the world, correlates with distancing and denial. Such relations occurred for individuals who were under stress. Similar to differences in coping foci, optimistic individuals look to others for help and attempt to examine the presenting problem. Their pessimistic counterparts instead withdraw from problem-solving goals and attempt to ameliorate negativity by denying the severity of the stress. Further, denial maintains its relevance in the assessment of personality, in part because of the invention and use of a wide range of items and scales purportedly assess that global and domain-specific forms of denial.

### Adaptive Denial

Whereas historical accounts of denial tended to emphasize it as maladaptive, a modern account, backed by research evidence, suggests that denial can sometimes be adaptive, similar to some coping strategies. From an information-processing view,

research suggests that in the immediate experience, individuals are more attentive to negative information than positive information. However, after a passage of time, they tend to recall positive information better than negative information, especially information that is relevant to one-self, compared to information about others. Such memorial biases evince diminished negativity and accentuated positivity.

These cognitive biases are potentially conducive to self and emotion regulation. Indicators of depression and anxiety disorders include the spontaneous rehearsal of negative information; such information is undesirable, intrusive, and is often the focus of treatment in psychotherapy. By extension, the disproportionate rehearsal of positive information in memory is a signal of mental health, and is therefore adaptive. Consistent with older accounts of denial, the comparatively infrequent occurrence of past negative events and personal information, like the rumination on one's negative attributes, suggests that denial of this type may preserve mental health.

Another modern view suggests that denial, among other defensive responses, can sometimes help individuals maintain continuity to their life stories. When thinking of one's past, denial can shield a person from the anxiety that would otherwise be provoked by revisiting unpleasant memories. In service to a person's present self-concept, denial may afford the opportunity to augment a past pleasant memory, perhaps exaggeratedly, such that the person experiences a boost in present self-esteem.

Denial may contribute to a person's authorship of the life story by inhibiting a contamination theme and by fostering a theme of redemption instead. Rather than recount the past as it actually felt, laden with both negative and positive emotions, individuals instead deny many of the negative emotions and elaborate the positive ones. Selective denial of past unpleasant events and of the negative feelings associated with such events contributes to rose-tinted retrospection, a perception of the past as more pleasant than it actually was. This includes denial in the framework of self and emotion-regulatory processes.

The future of denial in the psychological sciences would appear to be promising as a general valid construct that is unique from similar

constructs, such as coping. Theorists and practitioners will likely continue to study specific forms of denial, the contexts in which denial is useful and potentially harmful to the person and to others, as well as individual differences that are relevant to the experience of various forms of denial. Ultimately, the era of denial as a catchall term and something to avoid entirely has passed.

## Department of Defense, U.S.

There is no greater honor than the opportunity to serve one's country, and if need be, to die for it. This perception of patriotism has been ingrained into the American psyche since the American Revolution. Many Americans have an idealist image

that the nation's armed forces can do no wrong, and that the nation should forever be indebted to the military for its service. However, as history has shown, even the most patriotic individuals can engage in acts that can challenge this image.

Since its creation under the National Security Act of 1947, the U.S. Department of Defense (DoD), often called the Pentagon, has evolved into the most superior military force in human history, capable of waging war and gathering intelligence on a global scale. However, such power comes at an extreme price, both financially and morally. At times, DoD officials have demonstrated that the protection of its homeland and assets abroad outweigh its moral obligations. By employing deceptive tactics both domestically and abroad, this institution has caused many people to question its true intentions. At times, the department's concealment of information, blatant dishonesty, and manipulation of reality have undermined its objectives and have proven detrimental to its credibility.

Politically, deception is more than a simple mistake or naïve confusion; rather, it is the intentional misinforming of others in order to gain a strategic advantage. The Pentagon has used deception as a means to maintain and broaden control over military operations. Deception can be passively used, to mask real intentions or capabilities, or actively to provide evidence of intentions or capabilities that do not actually exist. By luring another party into believing an alternative scenario, the Pentagon, aware of the misconception, can capitalize on the situation and further advance its goals and objectives.

The key factor in the use of deception is determining the intended target and any unintended victims of the strategy. In a broad sense, deception can be waged against foreign enemies in order to disguise the reality of pressing international situations. More cynically, yet certainly verifiable, deception can be waged against the general public and media in order to conceal the truth. More often than not, these two targets of deception are related and inseparable, meaning that a deceptive action taken abroad is likely to be strategically fabricated domestically so that there is no discrepancy in signals. Any disparity could result in serious consequences that would adversely affect the Pentagon's legitimacy as a

trustworthy institution and its authority to use such actions in the future.

### **Deception in the Budget Process**

With a defense budget larger than that of the next 17 countries combined, there is little doubt that the DoD's superior reputation can be attributed to its enormous budget. Each year, Pentagon officials regularly testify before Congress in defense of their programs so that Congress can receive additional information before approving requested funds. Yet, there is ample evidence that proves that the department is not always telling Congress the whole truth, especially regarding the budgetary process.

Most within the department take great pride in the amount of resources allocated to their particular program. The Pentagon, like all federal agencies, is not limited by general profit and loss considerations, thus there is no benefit from decreasing its budget and increasing efficiency. In fact, many look down upon those who do not spend their entire budget because Congress will take back what is left of their unspent funds and appropriate less in the following year. Within the DoD, there are cultural incentives to spending its entire budget, yet there are little to no incentives for cutting spending. If there is a weapons program that is not meeting congressional expectations, it is more advantageous for Pentagon officials to omit important details and provide a fallacious perception of the program to Congress, rather than risk the deprivation of funds.

For example, in September 1985, Brigadier General Ronald Yates testified before Congress regarding the suspiciously exaggerated price for support equipment for the F-16 fighter aircraft. The product in question, the F-16 pulley puller, was priced in the proposed budget as \$8,832. During a prior investigative interview, Yates contended that the product should cost just a few dollars. Yates did the best he could to deny his previous statement before a congressional committee, however, he was eventually caught in his obvious lie. There are many examples of such obvious Pentagon budget fabrications brought to light by Representative John Dingell, who chaired the House Energy and Commerce Committee. Dingell was regarded as one of the few members of Congress who would challenge high-ranking

military officials about inconsistencies in their testimony.

### **Iran-Contra Affair**

Such compromising scenarios greatly tarnish the department's reputation. In some cases, evident deception has ruined the reputations of some of the most senior Pentagon officials. This was the case for former Secretary of Defense Casper Weinberger. Between August 1985 and October 1986, Weinberger was highly involved with the Iran-Contra Affair, a controversy that would engulf the Reagan administration. Weinberger's department was responsible for replacing Israel's missiles as Israel transferred their missiles to Iran, as directed by the United States. Ultimately, it was not the initial arms transfer that brought the demise of Weinberger. Instead, Weinberger gave false testimony about the extent of his personal knowledge of the affair, and he deliberately concealed his personal notes from the independent counsel. Through the efforts of an investigation led by Independent Counsel Lawrence Walsh, Weinberger was indicted by a federal grand jury on two counts of perjury and one count of obstruction. President George H. W. Bush later pardoned him in 1992. The Iran-Contra Affair is a testament to the negative power of deception and the amount of risk that is associated with the controversial strategy.

### **Abuse of Secrecy and the Pentagon Papers**

Because of the department's sensitive nature regarding its operations, intentions, and links with national security, the concept of secrecy is a privilege allotted to the Pentagon, although not without limitation. The government's monopoly on secrets is well understood as necessary in order to ensure adequate national defense, preserve governmental integrity, and enable foreign nations to trust that the United States will not reveal these nations' secret information. However, understanding the reasons for secrecy does not make the public any less skeptical of their government. When the department is seen as abusing its exercise of secrecy, the confidence of the general public and the international community declines, as does the Pentagon's credibility.

Government concealment from the public is persistently challenged today, largely because of

the debate over release of the Pentagon Papers. In 1967, as the credibility gap between President Lyndon B. Johnson and the public was growing because of increasing dissatisfaction over the Vietnam War, the Johnson administration was searching for new ways to win the war. That spring, Secretary of Defense Robert McNamara ordered the organization of all papers regarding the war. He planned to make an encyclopedia of U.S. policy in Vietnam so that he could study what had gone wrong and how he could fix it. The 47-volume, 7,000-page compilation was finished in 1969, and was classified as "Top Secret." A few copies were stored at the RAND Corporation, where a few individuals were given access to the documents. Late one evening, Daniel Ellsberg, who had access to the documents, and his friend Anthony Russo photocopied the documents, which eventually landed in the hands of reporter Neil Sheehan. On June 13, 1971, the *New York Times* published its first article based on the classified papers.

The documents, which came to be known as the Pentagon Papers, had a dramatic effect on the political landscape in Washington, and further fueled antiwar opposition. The papers gave a detailed look into the truth behind the Vietnam War, which, as many suspected, did not match what the general public was being told at the time. Ellsberg had essentially released and mass-distributed conclusive evidence of the repeated deceptions carried out by the government.

For example, the Pentagon Papers indicate that the Tonkin Gulf affair in August 1964 was a result of the Johnson administration's clandestine warfare against North Vietnam. This indicates that Johnson took advantage of the alleged incidents to secure the Tonkin Gulf Resolution, which brought the United States into open warfare in Vietnam. This story contradicts the supposed unprovoked attacks on the United States that was proposed to the public. Additionally, there is evidence that Johnson had already been searching for an excuse to escalate the war months before the Tonkin Gulf affair. The papers also reveal frequent falsifications by the president and his advisors, notably McNamara, about strategic plans and military action.

The legality concerning the publishing of Top Secret documents was determined by a U.S. Supreme Court ruling in 1971, which ruled in

*Secretary of Defense Donald Rumsfeld fields a question during the first Pentagon press briefing on the day of the September 11, 2001, attacks. While Rumsfeld rose to the challenge of combatting the new terrorist threat, he went about it in a way that many considered controversial. The Department of Defense (DoD), recognizing the need to craft favorable international opinion toward the United States, developed techniques to strategically harness the media as a means of giving the DoD the most advantageous reputation.*

favor of the *New York Times* on the basis of the First Amendment. As a result of this incident, the press became far more skeptical of the government, and reporters increased their investigations of government misconduct.

### **Waging the War on Terror**

The Department of Defense thrives when there is public confidence that it is doing what is best for the country and when the agency has an understanding of the world. When the Pentagon lacks this understanding and is less confident of its direction and goals, what remains is uncertainty, which is the root of deception. The more uncertain the DoD is of its intentions, the more it is inclined to amplify its deceptive strategies, domestically and internationally, in order to obtain a better grasp of the world.

In Vietnam, the Pentagon was unsure of its direction and failed to understand the big picture,

as the policy discussions in the Pentagon Papers indicate. Likewise, after the terrorist attacks of September 11, 2001, the Pentagon lost its sense of direction and understanding. The 9/11 attacks were the realization of the DoD's worst nightmare: American was vulnerable.

The department's lack of confidence and the subsequent War on Terror in Afghanistan and Iraq have come to symbolize the resurgence of powerful deception as a strategic tactic. What was new about the department's action during the Iraq War was that the United States was no longer fighting a state actor, but was instead waging war against a militant substate actor that used terrorism as its strategy. The Pentagon needed to adapt and rise to the new challenges of the globalized world. President George W. Bush placed a great deal of confidence in Secretary of Defense Donald Rumsfeld to combat the new threat of terrorists. Rumsfeld rose to the

challenge, but in a far more controversial way than most had anticipated.

In the process of developing new methods and strategies, Rumsfeld's Pentagon adopted a hard-line stance against terrorism and those who were suspected of harboring terrorists. However, in order to implement this transition in policy, the DoD recognized the need to craft international opinion in favor of the United States. Thus, the Pentagon had to develop techniques to harness the media as a mechanism of war by controlling the distribution of information in order to strategically give the U.S. military and its policies the most advantageous reputation.

One way that the military influenced the flow of information was by establishing the Rapid Reaction Media Team in January 2003. The job of the media team was to distribute news about the new Iraq government and the chance for a democratic future, all of which had to be approved by the Pentagon. In this strategy, the DoD used the media to support the new Iraqi government by means of deceptive propaganda. Another way that the military exercised control over the media was by using the more traditional technique of embedding journalists in military units. This tactic allowed the military to exercise control over what the reporter would see, based on what unit he or she was assigned. Also, by including reporters in the day-to-day routines of a particular unit, reporters would tend to develop personal relationships within the unit, and as a result were more likely to defend the troops, an advantage for the military. In both regards, the military was able to control the flow of information to people in the United States and abroad by deceptively directing what the journalists could see and with whom they made connections.

Deception is as much a potential strategy as it is a potential risk for all parties involved. The DoD has had its deceitful tactics exposed many times over the years. Between fabricated defense budget hearings, blatant lying, cover-ups, concealment, classified leaks, and control of information abroad, the credibility of the institution and the integrity of those who serve there have been tested many times. The Pentagon is an institution that can be seemingly beaten and tarnished beyond compare, and yet despite all odds, persist and grow. DoD deception strategies

against the American public and international community have damaged its credibility. Yet, while the American people have expressed dissatisfaction with on many occasions, and sharply criticized government authorities, they are reluctant to question the activities and policies of the Pentagon.

## DePaulo, Bella

Bella DePaulo (Ph.D., Harvard University, 1979) is a social psychologist and renowned researcher of deception. From 1979 to 2000, she was on the faculty of the Psychology Department at the

University of Virginia, where she received numerous awards and grants for her research. Since 2000, she has been a visiting professor at the University of California, Santa Barbara. She has published over 150 books, journal articles, chapters, and reviews. DePaulo studies deception and the detection of deception without the use of physiological tools. Since 2005, DePaulo has also become a prominent researcher and writer on the topic of people who are single, using scientific studies to debunk myths and stereotypes about singles.

### **Lying in Everyday Life**

Perhaps DePaulo's most famous research is her documentation of lying in everyday life. In two studies, she and her colleagues asked college students and community members to keep diaries of all their social interactions over a week, and to record information about any lies they told. These were the first studies to document how often people lie (approximately once or twice per day, on average), as well as the types and contexts of these lies. People generally told more self-centered lies than altruistic lies, except in dyads involving only women. People usually did not regard their lies as serious, did not plan most of their lies in advance, and usually did not worry about being caught.

Although people told fewer lies to close relationship partners (e.g., friends, family, and romantic partners), these lies tended to be more altruistic. Because most of these everyday lies were not considered serious, DePaulo and colleagues asked participants in a separate study to report the most serious lies they told and the most serious lies told to them. Most of these serious lies took place within close relationships.

Working with Charles Bond, DePaulo conducted a meta-analysis that synthesized the results of 206 previous studies to determine the ability of ordinary people to detect lies with no technical aids or special training. On average, people were accurate only 54 percent of the time, hardly better than chance (or 50 percent accuracy). However, people were better at judging lies based on auditory rather than visual information.

DePaulo is well known for dispelling the misconception that there is a Pinocchio's nose, or certain verbal or nonverbal cues that always mean that someone is lying. She and her colleagues conducted a meta-analysis of 120 previous studies,

examining a total of 158 potential cues to deception; most behaviors were not linked or were only weakly linked to deception. Nevertheless, they found some statistically significant differences between liars and truth-tellers; liars make a more negative impression, are less forthcoming, are more tense, and tell stories with fewer imperfections. Ironically, cues to deception are more pronounced among liars who are more motivated to succeed in getting away with their lies. DePaulo's research has also shown that the cues that people think indicate deception are not actually strongly related to deception.

DePaulo is one of very few researchers who have examined lie detection in friendships. She and her colleagues found that close friends are more accurate at detecting lies than less close friends.

DePaulo has also published an extensive and seminal theoretical analysis of the extent to which people use nonverbal behavior for self-presentational purposes. Nonverbal behaviors are often thought to automatically occur, in response to internal affective states. In her review, DePaulo challenged this notion, cataloguing the many ways in which people can (or occasionally cannot) feign affective states to manage social interactions. DePaulo found that people are frequently successful in their nonverbal "identity claims" in large part because perceivers tend to honor these claims, generally not questioning the truthfulness of senders' nonverbal expressions.

Some of DePaulo's earliest studies conducted with Robert Rosenthal examined sex differences in the ability to decode deceptive nonverbal cues. Although women are more accurate than men at decoding nonverbal cues to emotions, DePaulo and Rosenthal found that women were not any better (or worse) than men at detecting lies. They theorized that women tend to be more "polite" in their reading of nonverbal cues, which leads women to lose their advantage at decoding nonverbal cues when those cues are intended to be hidden from them.

Although lie detection accuracy is generally low, DePaulo has written about the possibility of "implicit deception detection," meaning that people may detect differences between deceptive and truthful communications, even though they do not know that these differences are indicative

of deception. Studies by DePaulo and others have found that people are less comfortable, less confident, less informed, and more suspicious when they hear a lie rather than a truth—even though these same people cannot identify the communication explicitly as a lie.

In other studies, DePaulo and her colleagues have examined the types of lies that people tell to spare the feelings of someone they like, the effects of physical attractiveness on deception detection, the effectiveness of salespersons and highly motivated liars at telling lies, and the deception-detection ability of special groups such as law enforcement personnel, socially anxious people, and dysphorics to detect deception. DePaulo's research underpins much of the current scientific understanding of deception and deception detection in everyday life.

## Disasters

The word *disaster* originally contained an astrological referent: the pejorative prefix *dis*, meaning "away from," attached to the Latin *astrum*, meaning "star." An ill-starred occurrence, much like its synonym "catastrophe" (that also contains the word *star*), the initial paradigm is that of disaster as a malevolent astral influence. Hence, the notion of disaster as an exceptional event that creates imbalance, a shift in the scales, or better yet, a destruction of the normal order of things.

Such an explanation asks for a definition of normality that, in turn, renders disaster studies all the more problematic. Therefore, a keen awareness of the definitional complexities of disaster calls for an analysis of the fine line that barely separates natural disasters from technological disasters and/or disasters instigated by an individual or a group, as well as for an exploration of the geography and politics of disaster. Thus, disaster will inevitably be tied to deception: Not only can disaster itself be deceptive, especially when causes are confused with effects, but it can also pave the way for deception, or political efforts at concealing, redefining, and rerouting the initial hazard. There is no possibility of separating disaster from deception or of disconnecting deception from the cultural politics of disaster.

### Disaster and Vulnerability

According to anthropologists such as Anthony Oliver-Smith and Susanna M. Hoffman, disasters have pasts, presents, and futures. The past can

be interpreted as the hazard itself, the present as the pattern of vulnerability, and the future as the expression of disaster, its treatment, and either deception or the possibility of deception. Oliver-Smith and Hoffman add that, "Whether rapid or slow in onset, disasters and the vulnerability leading to them unfold over time, often considerable amounts of time." This argument implies that vulnerability sets the stage for disaster.

However, cause and effect do not entirely delimitate the relationship between disaster and vulnerability, for this relationship also happens to be of a circular nature: Preliminary vulnerability eventually determines the magnitude of the subsequent disaster, and the ensuing disaster leads to augmented vulnerability. As a result, a subject rendered vulnerable (a subject that can be an entire population) is more likely to seek out a savior who is capable of deception, but who promises a return to normalcy. (Obviously, this savior has multiple possible manifestations: a despot, government, ideology, or religion) There exists, therefore, a constant link between disaster and deception: vulnerability.

### Hazards and Disasters

Disaster studies often begin by juxtaposing the words *natural* and *disaster*, and then proceed to distinguish natural disasters from non-natural or technological disasters. This approximation is of some value in an analysis of disaster as a concept and as an event because it suggests that in all disasters the initial tendency is to assign blame. The simplistic conclusion would be that natural disasters are the fault of nature, as opposed to non-natural disasters, which would be the fault of humans.

The next step is to classify as natural disasters events such as earthquakes, hurricanes, floods, desertification, pestilence, drought, volcanic eruption, famine, and tsunamis, to name but a few. The problem with this categorization, however, is that it fails to mark a distinction between hazards and disasters.

Oliver-Smith and Hoffman define hazards as forces that carry a potential for social, infrastructural, and environmental damage, and disasters as processes combining potentially destructive forces from the natural or built environment, and a population that socially and economically produces a

condition of vulnerability. Consequently, the list of natural disasters becomes a list of natural hazards, and with those two definitions in mind, it is possible to better interpret the distinction that critic Mark Anderson makes between sudden-onset disasters, such as hurricanes and earthquakes, and recurring disasters, such as drought, famine, and volcanic activity. Anderson is actually referring to hazards, not the ensuing disaster.

On the other side of the spectrum are the non-natural disasters (hazards), whether or not man-provoked, and the technological disasters (hazards), such as oil and chemical spills and chemical and nuclear explosions. Such hazards, in turn, and their disastrous consequences are more likely to be blamed on humans (rather than nature), even if Oliver-Smith and Hoffman argue that things that humans do (e.g., crimes, arson, war, terrorism, mass murders, civil disobedience, ) are actually not disasters.

Deception could very well begin with the first attempt to list disasters because this attempt confuses or dissimulates causes and effects. The truth is that earthquakes and hurricanes are not disasters, but rather occurrences. Kenneth Hewitt's classification is much more pertinent. In this case, there is no such thing as a natural disaster. Instead, there are natural hazards, and these can be atmospheric (hurricanes), hydrological (floods), geological (earthquakes), and biological (pestilence). With this type of categorization in mind, natural, technological, and human-made disasters become an effect rather than a cause, the accountable cause being either the natural hazards or the social processes. In other words, either man or nature is, in this case, held responsible, not the disaster itself.

### Social Processes and Disasters

Additionally, Ann Varley points out that in order to understand disasters, it is necessary to focus on social processes; in other words, "on human vulnerability rather than natural hazards." Her argument is that similar hazards, such as volcanic eruptions and earthquakes, can and will produce different outcomes in California and in Nicaragua, for example. It is likely that the vulnerability will be greater in an economically challenged country such as Nicaragua, whereas the disaster management in place in California,

although by no means perfect, could very well protect the state from greater loss of life and property.

Kenneth Hewitt, in turn, considers that the emphasis of vulnerability studies should not be on the character of the hazards, whether natural or technological, but rather upon how communities are exposed to dangers. Hewitt's argument is that society, rather than nature, "decides who is

*A man carries a baby through the flooded streets of New Orleans outside the Super Dome football stadium after Hurricane Katrina, August 31, 2005. All disasters and the ensuing deceptions can be seen in light of the concept of social vulnerability and social processes, which become camouflaged when the hazards that trigger the disaster are emphasized.*

more likely to be exposed to dangerous geophysical agents, and to have weakened or no defenses against them." Some of the forms and conditions of vulnerability listed by Hewitt include disadvantages or structural weakness such as poverty, dependency, lack of capabilities and rights, as well as "defenselessness," or lack of protection or aids to counter danger. Three categories fall under the rubric vulnerability syndromes: political economy (stages of development, class and power), worlds (first, second, and third), and impersonal forces (population, economics, and race).

All disasters and the ensuing deception can be seen in light of these concepts. There are countless examples of efforts to camouflage the social processes that augmented the initial vulnerability and to blame the stars. These ill-aligned stars come in many disguises: nature, ideologies, hostile foreign powers, chemicals, weapons, pollution, and global warming.

In 2005, Hurricane Katrina was blamed for the loss of life and property in Louisiana, without taking into consideration, as Hewitt points out, that hurricanes involve high winds, torrential rains, lightning, waterspouts, hail, and even tornadoes, and that therefore, death and destruction are the result of compound hazards. Furthermore, it was the pattern of vulnerability of the "disastered" subjects that was to blame, rather than the hurricane. In other words, economic and social situations, rather than the wrath of nature, created the victims of Hurricane Katrina.

More recently, two mass shootings that occurred in 2012, one in a cinema in Aurora, Colorado; another in an elementary school in Newtown, Connecticut, have put a focus on gun control. Although the debates and the questions are of value, it could very well be that they camouflage more pressing societal issues, such as treatment of the mentally ill, citizens' rights, and preventive health insurance.

### **Disaster and Deception in the Dominican Republic**

The examples of disaster and the cultural politics of disaster are endless. A survey of different situations runs the risk of diminishing the impact of disaster and of blurring the connection between disaster and deception. Therefore, it will suffice

to focus only a specific event or hazard that led to disaster that, in turn, led to deception.

The Dominican Republic will serve as paradigm. It is a pertinent choice because it is a region of risk, not only geographically but also economically; it continues to be a developing nation with poverty and racial and societal issues. In other words, vulnerability was a pre-existing condition: The island was at the mercy of natural hazards, as well as political ones.

In the summer of 1930, a military coup followed by a fraudulent election had consolidated the power of dictator Rafael Leonidas Trujillo. Then, a few weeks after the coup, on September 2 and 3, 1930, Hurricane San Zenón wreaked havoc on the island, causing unprecedented damage to the capital, Santo Domingo, killing thousands of people, and leaving a huge percentage of the population without shelter, food, or water.

It was an example of a natural hazard that led to a disaster of gigantic proportions that, in turn, coincided with the beginning of what would later be labeled the Era of Trujillo—and a disaster that consolidated Trujillo's power. According to scholar Mark Anderson, Trujillo responded to the disaster in a highly efficient manner by putting his military training to use on the relief efforts, and he used this response in the years that followed, “as a key trope in the narrative legitimizing his rule, which lasted from 1930 until his assassination in 1961.”

After the disaster, the country needed to be rebuilt and Trujillo proceeded to construct a New Patria or New Motherland. The moment could not have been more opportune: Here was a disaster-stricken nation, rendered all the more vulnerable by the forces of nature. In order to save this nation, Trujillo immediately declared a state of emergency and martial law. In other words, the dictator took advantage of the disaster-stricken subjects' vulnerability and appropriated the nation. The result was a loss of personal freedom and a rewriting of Dominican history through an astonishing act of renaming an entire country. Thus, the rebuilt capital ceased to be Santo Domingo (Holy Savior) and became Ciudad Trujillo.

As Anderson points out, Trujillo's rewriting impulse did not stop at the city limits, but “radiated forth to encompass the entire nation: Trujillo became the most common toponym in the

Dominican Republic, appearing from the capital to the Haitian border in private homes, and public parks, on street signs, bridges, public works projects, hillsides, and mountaintops. Two provinces were even rechristened in the family name.”

Relevant to 30 years of deception played out in the Dominican Republic (deception that is still being played out in every nation that has endured a disaster and is therefore starved for security), is the quote attributed to Benjamin Franklin, “Any society that would give up a little liberty to gain a little security will deserve neither and lose both.” There are a few variants to this quote, so liberty can be taken. Hence, a new variant, “Any society deceived into giving up liberty to gain security . . .”

## Disbelief, Suspension of

Poet Samuel Taylor Coleridge originated the phrase *suspension of disbelief* in the early 1800s, though the original phrase contained an additional word, “*willing* suspension of disbelief.” Coleridge's reference addressed how readers intentionally suspend particular beliefs and knowledge to allow their imaginations to enjoy what they know to be fictional accounts. This concept is used to explain why people want to hurl vile words at the villain, comfort the abused child, or

cry when the heroine dies at the end of the story, while knowing it is make-believe. Readers know that these are fictional characters but have willingly suspended their disbelief to better relate to the characters and plot. Key to the original usage of this phrase was its narrow application to readers of fictional accounts, which later expanded to audience members, thereby including the theater as well as written fictional accounts, and it is currently used for all fictional settings, including television, movies, video, and online games.

The word *willing* in the original phrase is crucial because it denotes the intentional nature of the individuals involved. Participants in every type of fictional activity knowingly suspend their disbelief to more fully enjoy the event. Coleridge made no mention of an unwilling or unknowing suspension of disbelief because this is an inconsequential concept to address via fictional works, but it is of utmost relevance when studying lying and deceit.

### **Suspension of Disbelief in Daily Life**

The willing suspension of disbelief is a typical aspect of life; everyone participates in daily fictional events, such as watching television and movies or reading. Most individuals have become quite adept at suspending disbelief because enjoyment of storytelling begins in early youth. Through this daily use from a young age, individuals have inadvertently been trained in the art of the suspension of disbelief, and in so doing obtained the ability to manipulate this tendency in others, to assist them to unknowingly suspend their disbelief.

One of the many key concepts encouraging others to suspend disbelief is to present a social situation as internally consistent (note the similar need in fictional stories to encourage the audience to suspend disbelief). For example, in an everyday situation in which people present themselves in a job interview as successful business persons, it would be best to present themselves in expensive brand-name apparel and accessories to encourage the interviewer to see them as successful, that is, to assist the interviewer to suspend disbelief, thereby not challenging the social role presented. If interviewees presented themselves in threadbare suits with inexpensive jewelry and beaten-up shoes and attaché cases, they would be presenting

themselves in a manner inconsistent with the social role of a successful business person, thereby encouraging the interviewer to disbelieve and challenge their social role.

Note this is only one aspect of an interviewee's social role. There also needs to be consistency in what is said in the interview, listed on the resume, and reported by references. This consistency needs to be within and across each aspect of the social situation/role, if the suspension of disbelief is to be encouraged. Remaining consistent sounds difficult, yet it is manageable because high numbers of individuals report effectively deceiving employment interviewers.

While the employment interview is only one example, the ability to assist others to unknowingly suspend disbelief is applicable to a variety of social situations in which deception is at play. Of importance to these situations is how the deceivers will attempt to achieve their goals while encouraging the other(s) to suspend disbelief, for otherwise disbelief could instigate a challenge to the presented social role/situation, potentially resulting in the discovery of the attempted deceit.

### **Social Roles and Situations**

Relevant concepts assisting others to suspend disbelief in everyday social situations may be altered from or entirely different than Coleridge's original meaning because of the difference in everyday social situations and fiction. First, was the concept of willingness (intentional suspension of disbelief) and unwillingness (unintentional suspension of disbelief), which is an altered meaning from Coleridge's initial definition. Another concept frequently discussed regarding fiction is the concept of plausibility.

For example, in modern times, people are willing to suspend disbelief and accept a Klingon character in the science-fiction show *Star Trek*. Yet, if a person presented himself or herself as a Klingon in a job interview for a public relations specialist, the interviewee would appropriately question the social situation and/or the person's social role. In regard to the social situation, the interviewer might ask the job seeker if someone is playing a prank or may verify that the open position is not to represent the *Star Trek* franchise. In regard to social role, the interviewee

may ask himself or herself if the interviewer is of sound mind or might need psychological assistance. Consistency and plausibility are merely two of the known concepts among a multitude of concepts combined together that create a believable social situation and/or social role. The fundamental aspect to remember is that individuals can assist others to suspend disbelief by presenting these concepts in a coherent manner in order to encourage the continued suspension of disbelief.

The potential for lying and deception resides within these complex issues. From youth, people learn the basis of the willing and unwilling suspension of disbelief, but the learning doesn't stop with just the rules; there is also the manipulation of the rules. The child who eats a cookie right before dinner, and when questioned replies, "No, I didn't," does not realize that the evidence is right on his face. Through consequences, the child learns about his lack of consistency when he is punished for lying and the family laughs about the smear of chocolate across his cheek. Teaching him to be honest has also taught him how to appear honest. The appearance of honesty without substance is one of the many ways to allow an individual to become effective with lying and deceit. Years of interaction create great communication repertoires and abilities in individuals, with only their morals to guide their choices as to whether they will assist another to unwillingly suspend disbelief.

The current usage of the phrase "suspension of disbelief" in the social sciences is derived from Coleridge's original meaning, with alterations for nonfictional everyday settings. The relevance of this concept is how individuals typically accept social situations as presented, unless aspects of the social situation suggest otherwise. A number of well-regarded social scientists also address this concept but with alternative terminology. In her book *Lying: Moral Choice in Public and Private Life*, Sissela Bok discusses how society presumes that social situations are based in honesty, that is, the veracity principle. This means that individuals are presumed to be telling the truth unless an event or person enters the interaction to alert individuals to a lie. Note the similarity: If the assumption is that truth is occurring, then one need not suspend belief.

In many of his works, sociologist Erving Goffman discusses the compulsion that an individual feels to present a self that adheres to the social expectations of a particular social role in a specific social situation. When a person feels compelled to fulfill a particular role, deception may come into play, yet fulfilling the role may not in any way violate expectations, so once again this can encourage the suspension of disbelief.

Thus, the suspension of disbelief began as a literary concept in the arts, in which individuals chose to willingly suspend their disbelief, and is still addressed in this manner in the arts and humanities. In the social sciences, the underlying premises of this concept—that individuals readily accept situations and roles as presented, unless something occurs that violates expectations—allows researchers to further expand their ability to understand how lies, deception, and con men exist in society.

## Discovered Deception, Reactions to

The discovery of deception is generally presumed to be an intense, negative, emotional experience. In the classic novel *The Count of Monte Cristo*, for example, when Dantes deduces that his

imprisonment is due to the lies of people he considered friends and allies, his response is such an all-consuming anger that he swears (and subsequently pursues) unfettered vengeance against his antagonists. Such a reaction is not limited to historical literature. Tales of violent reprisals in the wake of discovered deception dominate theatrical storylines, television shows, and real-world headlines.

The presumption of a negative reaction to discovered deception is not surprising when one considers the cognitive, relational, and emotional disruption that such events should evoke. Consider cognition: As Charles R. Berger and Richard J. Calabrese described four decades ago in their uncertainty reduction theory, people place great importance on believing that others are predictable and explainable. When people behave in ways that defy such beliefs (such as when deception is discovered), enormous anxiety ensues. This uncertainty centers around two dilemmas that dovetail with a lost sense of predictive and explanatory power: “How did I not see this coming?” and “Why did this happen to me?”

On the relational side, individuals in close involvements typically believe that they understand their partners, that their partners would never lie to them, and that if their partners did lie to them, they would be able to tell. Discovery of deception directly compromises all three of these convictions; hence, it is a devastating relationship event.

In addition, modern theories of emotion posit that intensity of affective experience directly corresponds to the degree to which events are interruptive of organized action sequences that guide individuals’ daily behaviors, as well as higher-order goals and plans. Discovery of deception constitutes a radically interruptive event; consequently, it is intensely emotional.

### Studies of Reactions to Discovered Deception

Because of the degree to which discovered deception is a dominant historical and narrative theme, and the intensity of cognitive, relational, and emotional disruption that occurs in its wake, it is surprising that it has received comparatively scant empirical attention from scholars. In fact, only a handful of studies have directly or indirectly examined this important topic.

One of the first noteworthy commentaries on discovered deception was offered by philosopher Sisela Bok in her seminal work, *Lying: Moral Choice in Public and Private Life*. She describes how individuals, upon discovering that they have been lied to, “are resentful, disappointed, suspicious. They feel wronged; they are wary of new overtures.” Soon thereafter, communication scholar Dale Hample examined liars’ self-reported consequences for having lied; he noted that because the social costs associated with discovery were high, liars will typically only lie when they feel that the rewards are certain and sizable.

Subsequent to Hample’s work, Sally Planalp and Jim Honeycutt explored uncertainty-increasing events, and their data underscored the indelible link between uncertainty and discovered deception. Planalp and Honeycutt surveyed 103 respondents, asking them to describe in detail an event “in which they learned something surprising about a friend, spouse, or romantic partner, and that information led them to question something basic to their relationship.” They then examined the impact of such events on four outcomes: relationship beliefs, emotional effects, communication, and relationship consequences.

Planalp and Honeycutt found that 90 percent of respondents could recall such an event. The third-most commonly reported uncertainty-increasing event was deception, including “instances of relational partners lying about where they were going, about drinking and smoking, about other relationships, and misleading respondents about their true feelings for them.” Not surprisingly, discovered deception had a substantial influence on beliefs about honesty (i.e., trust). Although they did not examine the impact of particular events on their outcome variables, uncertainty-increasing events in general negatively impacted emotional states, and frequently led to a reduction in relationship intimacy.

### Steven McCornack and Timothy Levine’s Study

The first study to exclusively focus on reactions to discovered deception was the work of Steven McCornack and Timothy R. Levine. Drawing upon Ellen Berscheid’s theory of emotion, as well as prior work in cognition and relational

deception, McCornack and Levine argued that relational intimacy, the importance of the information that is lied about, suspicion, and the degree to which lying is viewed as a transgression will impact emotional reactions to discovered deception. Analyzing the self-reports of several hundred respondents, McCornack and Levine found confirmation for their predictions.

However, they also found an interesting interaction between suspicion, information importance, and emotional intensity of reaction. For individuals who were suspicious at the time the lie was received—but for whom the information was unimportant—suspicion functioned to reduce intensity of reaction upon discovering that the statement was, indeed, false (i.e., “Yeah, I thought you were lying to me when you said that, but it’s no big deal anyway”). For information judged to be important, however, the opposite effect held true: The temporal downtime between receiving the lie and verifying its falsity functioned to enhance intensity of reaction (“This confirms exactly what I’ve been stewing on for weeks!”). McCornack and Levine labeled this “the stewing effect.”

McCornack and Levine also examined the impact of these variables upon relationship termination. They found that negativity and intensity of emotional reaction, and importance of the information, significantly predicted relationship termination, with the most influential factor being information importance. In 67.4 percent of the cases in which the relationship had ended, the discovery of deception was cited as the cause for the breakup.

### How Deception Is Discovered

Discussing reactions to discovered deception begs the question of how exactly such discoveries occur. Contrary to media depictions of such events (e.g., the television show *Lie to Me*) and conceptual perspectives implying that lies are detected on the spot through the strategic hypervigilance of listeners (e.g., interpersonal deception theory), the vast bulk of actual deception detection occurs through incidental discovery.

For example, Hee Sun Park, Timothy Levine, and their colleagues examined self-reports from more than 200 individuals who recently had discovered lies. Their data suggest that,

overwhelmingly, lies are discovered not through direct behavioral detection but, instead, through third-party information or the discovery of incriminating evidence. In only four instances in the entire dataset did participants report having detected a lie through verbal and nonverbal behaviors at the moment it was delivered.

### Deception Discovery Online

Recently, scholars have shifted their analytical focus to the impact that discovered deception has within online settings. For example, Zachary Birchmeier, Adam Joinson, and Beth Dietz-Uhler examined transcripts from an asynchronous, online community in which “DF”—a high-status, well-liked member—was discovered as having deceived members of the group by posting under an additional, false identity (as a purported single mother, “NowhereMom”).

DF went so far as to construct an online romance between himself and NowhereMom, and he then told members that NowhereMom and her (fictional) daughter had been killed in an accident. Community members created online memorials to express their grief at her “death,” only to have DF confess that NowhereMom was, in fact, a fiction. In the wake of his disclosure, members expressed shock and outrage at the deception, posting numerous condemnatory messages and eventually banning DF from the community.

Taken as a whole, these data suggest that reactions to discovered deception are typically intense and negative. Yet, people continue to lie. Why? Scholar Tim Cole, in his study of deception in romantic relationships, found that one of the major reasons that people lie to their partners is to avoid anticipated negative punishments associated with truth-telling.

Cole’s findings suggest a deep irony with regard to reactions to discovered deception. People commonly choose to lie to avoid costs. But their lies, once discovered, often net negative outcomes—in the form of emotional upheaval, condemnation, and relationship termination—that grossly outweigh the anticipated truth-telling costs that drove them to deceive in the first place.

## Dishonesty

The term *dishonest* is used to characterize an action, statement, or person. Dishonesty involves obscuring information, providing untrue information, or withholding information that the other person has the right to hear. Actions can also be characterized as dishonest when they violate trust. The word *dishonest* is, etymologically speaking, an equivocal term; its usage merely suggests that the speaker or statement is without something (i.e., honesty) rather than possessing something (a will to discursive corruption, a characterization better realized by terms such as *lie* and *liar*). When an accusation is uncertain or comparatively lacking in vitriol, then the speaker is likely to say, "That is a dishonest statement," saving the term *lie* for circumstances more definitive or vicious.

Dishonesty can be performed as honesty, and must be so performed in order to be effective. This requires a salient capacity to emulate the tones, gestures, and rituals of the honest person and to repress the "tells" that typically arise when a person deliberately evades speaking truthfully. Similarly, honesty can be performed in such a way or under such circumstances that it is taken for dishonesty, as John Canty takes the words of the young prince, dressed as a pauper, in the famous Mark Twain novel. A competent social agent cultivates some capacity to detect dishonest people, as well as dishonesty in statements.

### Dishonesty in Statements

A dishonest statement is not one that is merely untrue, for untrue statements can be offered in

error. Rather, a dishonest statement is made when a speaker offers a statement that he knows to be counterfactual. To know that it is sunny and say that it is raining is to make a dishonest statement. Counterfactual statements about weather conditions offered when the audience is equally present to the same weather condition are not dishonest statements, however, they are absurdities. This is because the dishonest statement exploits the vulnerability of an uninformed audience by offering it untruths in the guise of truths.

Not all deliberately counterfactual statements would be labeled dishonest, however. Riddles, jokes, stories, myths, and fantasies all rely on the

counterfactual; it is not dishonest, for example, to tease someone, nor is it dishonest to tell a joke, and all such counterfactuals are distinct from dishonesty in that they are presented and coded as forms of play. In play, however, as George Herbert Mead explains, the sender of a message sends signals that the pretend event is playful. For a statement to be dishonest, then, it must be counterfactual and must be offered as if it were in earnest.

A compliment is not a dishonest act when it is principally offered to raise the spirits of the recipient. However, obsequiousness, excessive flattery, and other language forms used to ingratiate self to other via falsehood are dishonest acts.

### Dishonesty in Persons

It is both possible and common, based upon regular observations of another person's statements, to suggest that dishonesty is not just specific to a given person's statement, but also integral to that person's character. Those of dishonest character display dishonesty to others with marked regularity while giving honesty performances (with eye contact, facial gesture, and tone) and engaging in honesty rituals. Where dishonesty is attributed as a characteristic, the identified person is dishonored, and under normal circumstances, the person labeled dishonest is shunned. The statements of an individual labeled dishonest, even the statements that seem likely, are taken as suspicious; the individual's views are given lower valence in contesting (he said/she said) situations; and the individual is comparatively unattractive to others as a friend, coworker, and employee. To be given the identity of a dishonest person is thus to be discharged of social capital. Whereas dishonest people rely upon the cover of honesty to sell their wares, being labeled a dishonest person puts them out of business.

### Dishonesty and Secrecy

A secret is not the same thing as a lie, and it is not necessarily an act of dishonesty to withhold information from an audience. The social philosopher Georg Simmel, for example, condemned the lie, but regarded the secret as a social good. Nevertheless, it is customary to regard as dishonest secrets kept from people who have justified reason to know them; for example, it is dishonest to keep a previous marriage from a fiancé or a history

*"Tom's Meeting with the Prince," as illustrated in Mark Twain's The Prince and the Pauper (1881). Honesty can be performed in such a way or under such circumstances that it is taken for dishonesty, as John Canty does of the words of the young prince, dressed as a pauper, in the novel.*

of drug abuse from a political campaign. Part of the structure of social trust requires audiences to make normative assumptions about others; social agents do not interrogate everyone they meet, nor do they run credit checks on prospective lovers. Instead, they rely on the norms of disclosure specific to the nature of the relationship. A divorcé is not expected to announce this personal characteristic at the first handshake. Nevertheless, as intimacy increases, an appropriate disclosure period approaches, even without the interrogation of the other person. It is common to regard as dishonest those occasions when a person lets those periods slip by in silence.

### The Weight of Dishonesty

Because dishonesty causes weighable damage, dishonesty accusations are also weighted (i.e., some dishonesty charges are more forceful than others). To be labeled dishonest with pejorative moral force is to receive moral opprobrium because the emotive texture of the utterance brands an association between the receiver of the term and the emotional resonance of the term. When used to describe a person, the word *dishonesty* infects that person with its moral force. The impact of dishonesty varies as a result of the following factors, which also shift the odiousness of the phenomenon:

*Intimacy.* As relationships grow closer, mutual dependency increases. Dishonesty therefore becomes more egregious over time because the damage it can cause, in principle, increases.

*Relevance.* A dishonest matter increases in weight to the degree it bears impact on the life of the person hearing it. A dishonesty is more weighty when a mechanic falsely tells a customer that an engine change is needed in his car than if he says it about a stranger's car.

*Significance.* A dishonest matter increases in weight with the degree that the dishonesty affects the life of the person told. It is, for example, a weightier dishonesty to tell a man that his wife has cheated than it is to tell him that his shoelace is untied; and a man who untruthfully tells a prospective employer that he is an experienced dishwasher will not be labeled dishonest with the

same moral opprobrium as one who tells a potential employer that he is an experienced surgeon.

*Regularity.* As the pattern of dishonesty becomes more regular, the weight of the dishonesty increases. The greater the number of "fibs," the greater the moral force of the dishonesty charge, regardless the quality of the fibs. To a great extent, this is the process by which dishonest statements made by a person lead to the point when the person becomes known as a dishonest person.

*Injustice.* The degree of injustice specific to a dishonest remark impacts the weight of it. It is not particularly unjust, for example, to tell a prying salesman that one already has a full life insurance policy. But it is comparatively unjust to tell an applicant, falsely, that the deadline for a job application has already past; and it is considered a greater dishonesty to tell a sexual partner that one is disease-free than it is to say the same thing to a prying stranger.

In such ways, the degree of moral force specific to the accusation of dishonesty is thus assigned according to the weight of dishonesty attributed to the statement.

The moral force specific to the term *dishonest* is not so great as the moral force specific to the term *liar*. In part, this is due to the nature of the terms. Expressively, having only three letters and one syllable, the word *lie* is an ideal conveyor of vitriol, carrying emotive and therefore moral weight when it is uttered. One only needs to imaginatively compare oneself pilloried before an audience shouting, "Liar! Liar! Liar!" to the same thing in front of an audience shouting, "Dishonest person! Dishonest person! Dishonest person!" to recognize that there is a difference. All the same, it is damaging to be labeled dishonest, irrespective of the varying degrees of moral force fastened to the accusation.

### Recognizing and Performing Dishonesty

Human beings who perform dishonesty must do it under the cover of honesty in order to be successful, for this allows them to build the reputation and sincere attachment so important to successfully delivered, corrupt communication. This requires a talent for controlling vocal tone, facial expression, evidence, and other competencies in a

manner that makes a falsehood indistinguishable from a reality. Once those competencies are in place, it is extremely difficult for others to detect dishonesty.

Dishonest statements, by definition, provide information that audiences can only receive in a secondhand fashion, and people are immeasurably dependent upon that sort of communication in order to effectively function. Of course, dependence on the words of others makes audiences vulnerable to the effects of dishonesty. Consequently, socially successful persons work hard to gauge honesty, at least to assess the relative integrity of the people to whom they bond; this is a basic survival skill.

Prudent social actors must also work hard to determine whether the untrue statements or performances to which they are exposed are the result of accident or deliberate intent. Social actors must learn to detect erroneous statements made in the spirit of honesty, so that they do not abandon people who would have been honest but were in error, and so that they do not attach to people who merely calculate their honesty with respect to self-interest.

As was the case in *Hamlet*, dishonesty is most firmly established within the context of a trap. A person who believes that he is the patsy to a liar may choose to feign ignorance of a known topic, approaching the suspected liar with a request for information on that topic. When the suspected person comes back with a counterfactual statement, it is at least possible to identify the deliberate untruth, establishing both that the suspected liar tells untruths and the suspected liar does so intentionally. The art of catching out dishonesty is quite subtle, however, and timing is important. Even in such a trap, the suspected liar may recover using strategies aimed at managing dishonesty if the trap is sprung too soon. It is for good reason that the saying, "There was a crooked man and he did very well," is far better known than its creator, Eve Meriam. In general, a sophisticated, even visceral, grasp of language and semiotics is essential to both performing and recognizing dishonesty.

### Managing Dishonesty Failures

Typically, dishonesty is not charged until substantial evidence supporting the accusation exists.

However, circumstances often still favor the liar, even at so late an hour, because the accusation must be grounded in three observations: that the lie was given, that the lie was known to be counterfactual when it was given, and that the counterfactual was performed as a false offer of truth. The liar thus has three lines of approach in an effort to manage his discovered dishonesty: He can deny that he ever gave the counterfactual statement, suggesting that he was misunderstood by the accuser; he can claim that he was in error and believed the counterfactual when he offered it; or he can claim that he performed the counterfactual in a manner that indicated it was playful, not a serious untruth. Because recollection is imperfect, error is possible, and play signals may be overlooked, one cannot always make a dishonesty charge stick, even if one has patent evidence of an untruth, especially if the defendant has refined dishonesty skills. Consequently, dishonesty is managed with comparative success, even when it is initially discovered.

As accusations of dishonesty mount (many people accusing dishonesty with respect to one thing, or one person accusing dishonesty with respect to a series of things), it becomes much harder to sidestep the label, instead claiming misunderstanding, error, or playfulness. Moreover, the accumulation specific to the detection process increases the risk that, in the end, one will not merely be said to have made a dishonest statement, but one will be labeled a dishonest person. The presumption of honesty, once lost, is hard to regain. Ferreting out a dishonest person is not easy, and losses occur during the period that detection takes place. The tendency, therefore, is to presume that the dishonest person is characterologically dishonest, and to expect dishonesty in the future, rather than to provide an interminable series of second chances.

### Dishonesty in Complex Social Systems

Because of the relative dissociation of persons in complex societies, the prices and penalties associated with dishonesty are markedly reduced. In a complex society, expressions such as "take the money and run" make sense because there is, indeed, somewhere to run. The dishonest repairman need only see a customer once. The dishonest student might only have a teacher for one class and one year. Dissolution of a relationship, a real

concern with respect to dishonesty in communal life, matters much less in a complex social life in which the relationship is often ephemeral at best. Complex social life also provides more opportunities to isolate one aspect of life from another, facilitating deception. The dishonest spouse has countless opportunities to betray a partner.

Losses and gains are also mitigated in a complex society, reducing the importance of proving dishonesty. One may buy an inferior product, based on the claims of a dishonest seller. The loss of time and the labor required to prove the dishonesty and to gain compensation may simply be determined “not worth it.” When that occurs, the price paid for dishonest behavior is comparatively small and the gains of dishonesty are great.

For reasons such as these, dishonesty holds an ambivalent status in contemporary society. Is one honest or simply a fool for leaving a phone number on an automotive windshield after mildly denting that car’s door when getting out of one’s car? Is it reasonable to look down one’s nose at every millionaire who has made his millions, at least in part, through dishonest actions? Or is dishonesty the watermark of greatness?

Contemporary society would not be the first to find no easy answer to this question. Among the ancient Greeks, for example, nobility of character required role performances specific to one’s lot in life; and a great soldier was, therefore, expected to be cunning. Spartan boys, as they evolved into soldiers, were trained to steal, and only punished for being caught. Such acts of dishonesty are particular to an adversarial system that places dishonesty in its context with respect to justice—the enemy not due unqualified honesty.

### **The Power of Dishonesty**

Honest statements give audiences access to nonpresent places and times, allowing them to plan, create, imagine, and organize. Thus, honesty plays an immeasurable role in productive human relations. The honest transaction takes place within an exchange system that benefits the several parties involved in some comparatively anticipated fashion.

Should a woman, for example, borrow her neighbor’s car and scratch the bumper, she might honestly report what she has done and make restitution; in this case, the neighbor receives a minor

repair and the woman retains her esteem (and her personal sense of integrity), so that she might borrow the car again. In such cases, gain and loss is distributed in a manner that approaches a Habermasian ideal. The nature of dishonesty, however, allows the woman to maximize her gain at the other’s expense because she knows something that the other does not: She knows about the scratch and that she is responsible. Because she alone has this knowledge, she can manipulate it to her own advantage. She can, for example, spread mud over the scratch, leaving the neighbor uncertain when, and therefore how, the scratch occurred when the rain comes and washes away the camouflage. By doing so, she has maximized, economically speaking, her gain in the immediate situation.

The power of dishonesty, then, is that it allows its agents to maximize personal gain in a system in which gain and loss would be otherwise distributed. This is the nature of dishonesty in investment scandals, adulterous relationships, examination cheating, and the selling of cars that are “lemons.”

### **The Price of Dishonesty**

Dishonesty is motivated by self-interest, but this is self-interest narrowly conceived, governed by a notion of basic pleasure or immediate gain. Recognizing that there are greater treasures than either pleasure or gain, Josef Pieper refers to the dishonest person’s rationale of self-interest as “false prudence,” the sort of prudence that causes a person to wear a mask when staging a robbery. The idea is expressed by Christ in the Gospels when he says, “What good is it for a man to gain the whole world, and yet lose or forfeit his very self?” In such an interpretation, selfhood has value and therefore pays a price when it acts dishonestly.

Even for those who dismiss the value of a noble or virtuous self, a second potential price for dishonesty remains, which is the manageability of dishonest action over time. Each time one is dishonest to one’s neighbor, for example, one must keep a record of that dishonesty in order to manage future contexts in which the content of the lie might come up or be relevant. One must also manage the juxtaposition of people who do or do not know the lie, so that their paths never cross.

Successfully lying requires ongoing outputs of energy in the form of record keeping, social performances, and environments necessary to make lies thrive. The adulterer, for example, must pay for hotel rooms, make up for lost time, and create plausible stories.

Similar expectations exist for most, if not all, liars who habitually live in lie. The liar may be obliged to draw in confederates, turning an entire event into a theater of deception. These sorts of activities, and there are many more, exert a cost on the dishonest person in terms of stress, memory, foresight, and inventiveness. A dishonest person must also attend to the cumulative effect of deceptions. The law of parsimony predicts that a time will come when it will make more sense for the victim of dishonesty to switch paradigms, regarding past and present “coincidences” and “errors” as lies told by a dishonest person, rather than coincidences told by an honest one. At that point, the dishonest person may be ousted from the intimacy and exchange system already established. The victim may also report one’s dishonesty to others, damaging the liar’s community standing. For the person of narrow self-interest, dishonest action is a gamble, offering short-term rewards, but only for those willing to risk long-term consequences.

## Disinformation

Lying has long been the main topic in the study of deception. For instance, many philosophers discuss why it is wrong to lie, and psychologists study how to detect lying. However, in the information age, disinformation is a much more encompassing threat to individuals’ ability to acquire true beliefs and to avoid false beliefs about the world. Examples include government propaganda, deceptive advertising (political and otherwise), Internet frauds, doctored photographs, forged documents, deliberately falsified maps, and manipulated Wikipedia entries.

The term *misinformation* simply refers to information that is false. False information can mislead people (i.e., cause people to hold false beliefs) whether it results from an honest mistake, negligence, unconscious bias, or just overly subtle sarcasm. The term *disinformation* (coined during the Cold War) picks out a particularly dangerous subcategory of misinformation. The *Oxford English Dictionary* (OED) defines disinformation as “the dissemination of deliberately false information, especially when supplied by a government or its agent to a foreign power or to the media, with the intention of influencing the policies or opinions of those who receive it; false information so supplied.” More generally, disinformation can be defined as information that has the function of misleading someone. In other words, it is information that is likely to cause people to hold false beliefs and has the function of doing so. In any event, disinformation poses a more serious threat than other types of misinformation because it comes from someone who is actively engaged in an attempt to mislead.

### Sources of Disinformation

As the OED suggests, disinformation is commonly associated with government or military activity. George Carlin quipped, “the government doesn’t lie, it engages in disinformation.” A standard example is a disinformation campaign known as

*U.S. Army Staff Sgt. Doug A. Baker listens to radio traffic during an operation conducted by Afghanistan National Army and U.S. forces to thwart a Taliban disinformation campaign in the Shigal Valley in eastern Afghanistan's Kunar province, March 18, 2011. Disinformation varies in how it reaches its target. It can be as technically sophisticated as a carefully planned military strategy, to something as simple as telling a lie. In addition, disinformation is often passed along and indirectly received.*

Operation Bodyguard during World War II, in which the Allies sent out fake radio transmissions and created fraudulent military reports to conceal the intended location of the D-Day invasion from the Germans.

However, many nongovernmental organizations, such as political campaigns and advertisers, also deliberately distribute false information. In fact, individuals are often the source of disinformation. For instance, reporters such as Jayson Blair of the *New York Times* and Janet Cooke of the *Washington Post*, have made up news stories that have misled their readers. There are also several high-profile cases of purported memoirs that turned out to be fiction, such as James Frey's *A Million Little Pieces*.

### **Targets of Disinformation**

In addition to having various types of sources, disinformation can have various kinds of targets.

It is often very widely distributed (to anyone with a newspaper subscription, a television, or Internet access). This is typically the case with government propaganda and deceptive advertising. However, disinformation can also be targeted at specific people or organizations. This is humorously illustrated in a cartoon by Jeff Danzinger (of the *Los Angeles Times*) that shows a couple working on their taxes. The caption is, "Mr. and Mrs. John Doe (not their real names) hard at work in their own little Office of Strategic Disinformation." Such disinformation is presumably aimed directly at the Internal Revenue Service.

While the intended victim of the deception is usually a person or a group of people, disinformation can also be targeted at a machine. For instance, as the information scientist Clifford Lynch points out, managers of Web sites sometimes try to fool the automated "crawlers" sent out by search engines to index the Internet.

Suppose that someone has just started selling product X, which competes with product Y. When an automated crawler asks for product X's Web page to add to its index, the salesperson for product X might send the crawler a copy of the Web page for product Y. That way, when someone uses the search engine to search for product Y, the search engine will return a link to product X's Web page.

### Formats of Disinformation

Disinformation also varies in the form that it takes. It is often written or verbal information, but not always. Mark Twain joked that, "by examination and mathematical computation I find that the proportion of the spoken lie to the other varieties is as 1 to 22,894." In particular, visual information can also be disinformation. For instance, Josef Stalin and Mao Zedong each had people who had fallen out of political favor removed from photographs. Similarly, during the Cold War, the Soviet Union deliberately falsified maps in an attempt to fool its enemies about where important sites were located.

In line with the OED definition, disinformation is typically false information. However, contrary to what philosophers such as James Fetzer and Luciano Floridi have suggested, even information that is true can sometimes be disinformation. For instance, when pursuers who did not recognize him asked, "Where is the traitor Athanasius?" Saint Athanasius replied, "Not far away." Although what he said was true, Athanasius misled his pursuers into thinking that he was not Athanasius. In the realm of politics, true statements that selectively emphasize facts that are advantageous to the speaker can be intentionally misleading and are typically referred to as "spin."

But not everything that is created in order to mislead someone counts as disinformation. For instance, in addition to the disinformation campaign during World War II's Operation Bodyguard, the Allies built tanks and airplanes out of rubber and canvas to give the false impression that a huge force was preparing to attack Calais, rather than Normandy. These fake tanks and airplanes are not examples of disinformation because they are material objects, rather than pieces of recorded or transmitted information.

### How Disinformation Finds Its Target

Disinformation also varies in how it finds its target. As with Operation Bodyguard, it is often the product of a carefully planned and technically sophisticated deceit. For instance, hackers have directly modified the Web sites of news services such as Yahoo! News and the *New York Times*. However, the dissemination of disinformation can also be as simple as telling a lie. In fact, even manipulating the contents of a Web site does not always require sophisticated hacking skills. Anyone can purposely (and anonymously) add inaccurate information to Wikipedia. For instance, the entry on the journalist John Seigenthaler was famously modified to falsely claim that he was involved in the assassinations of John F. Kennedy and Robert F. Kennedy.

In addition, one does not always directly receive disinformation from the organization or the individual who intends to deceive. For instance, news services have often been tricked into passing along false or misleading information created by someone else. A few years ago, a con man created a fraudulent press release stating that the chief executive officer of Emulex Corporation had just resigned. When this fraudulent press release was subsequently published by several reputable news services (including Bloomberg, *CBS Marketwatch*, and Dow Jones), Emulex stock lost over half its value in just a few hours.

Furthermore, disinformation is not always openly addressed to its target. It can be intended to fool someone who is expected to be eavesdropping on the transmission of the information. For instance, in William Shakespeare's *Much Ado About Nothing*, this is how Benedick's friends trick him into believing that Beatrice is in love with him. Similarly, the Germans were not aware that they were intended to receive the radio transmissions and the military reports that were part of Operation Bodyguard.

### The Mental State of the Source of Disinformation

In line with the OED definition, disinformation is typically intended to mislead someone. However, contrary to what philosophers such as Fetzer and Floridi have suggested, not all disinformation is disseminated with this goal in mind. For instance, fraudulent Web sites, such as one advertising a

town in Minnesota as a tropical paradise, have been created by educators to teach people how to identify false information on the Internet. In addition, researchers have posted false information on Wikipedia simply to see how long it takes for the information to be corrected. Such false and misleading information is intentionally produced, and it may easily mislead some people, but that is merely an unfortunate side effect of what these educators and researchers are doing.

While these educators and researchers foresee that people might be misled, the source of a piece of disinformation may not even be aware that the information is false or misleading. Certain animals and plants can systematically give a false impression. For instance, there are species of insects that have evolved to look like sticks or leaves. These insects do not consciously intend potential predators to believe that they are flora rather than fauna. However, it is no accident that potential predators are fooled. The deceptive camouflage gives these insects an adaptive advantage. In particular, they are less likely to be eaten. Thus, the deceptive camouflage is more likely to continue into the future (because the genes that create it will be passed on to future generations).

Although one might not want to refer to the deceptive appearance of an animal or a plant as disinformation, human beings can spread false and misleading information in an analogous way. For instance, some people promulgate conspiracy theories, such as the belief that the U.S. government was behind the terrorist attacks on September 11, 2001. Many people also endorse certain stereotypes, such as describing Native Americans as “noble savages.” Because such people often believe what they are saying, they are not deliberately disseminating false information. Even so, such false and misleading information deserves the name *disinformation*.

There is a mechanism that reinforces the dissemination of this false and misleading information. Much like stick insects, people benefit from spreading stereotypes, conspiracy theories, and rumors. For instance, the promulgation of stereotypes helps the dominant cultural group maintain its dominance (and allows its members to maintain a positive self-image). These examples indicate that a conscious intention to mislead is only one of the ways in which a piece of

information can end up having the function of misleading people.

## Distrust

If trust is the confident expectation that another has one’s best interests at heart and can be counted on to act on those interests, then distrust is the confident expectation that another person’s motives, intentions, and behaviors are more than likely harmful to one’s wellbeing. Distrust stems from a combination of fear of vulnerability and the subsequent desire to “get them before they get you.”

### Distrust in Childhood

Distrust can begin early in life, in some cases soon after birth. When an infant’s needs are not

consistently met on a regular basis, the child begins to doubt whether or not the adults in his or her life can be trusted. When caregivers are insensitive and unresponsive, children become distrustful of their caregivers and are unable to rely on them. In the face of insensitive caregiving, infants respond by either avoiding or clinging to caregivers. These unhealthy attachment behaviors can carry over into adulthood and permeate not only family relationships but also friendships and romantic and work relationships. Distrust that stems from early childhood experiences can also spill over into an adult's parenting practices. For example, in a type of self-fulfilling prophecy, a mother's profound distrust was related to more hostile, intrusive, and negative behaviors toward the infant. These behaviors can cycle through the infant's experience, resulting in distrusting or avoidant tendencies in the child.

### **Distrust in Intimate Relationships**

In close, intimate relationships, distrust is particularly divisive. The distrusting partner not only maintains constant vigilance over their partner's actions, but also any attempt by the offender to make legitimate reparation for the violation of trust will be perceived through a lens of suspicion and skepticism. This can be readily seen in the behavior of people with a fearful attachment style, who describe themselves as uncomfortable getting close to, trusting, or depending on others for fear of being hurt if they become too close. Individuals who are distrustful by nature experience higher levels of intimacy avoidance and often greater feelings of anxiety about being abandoned, resulting in them being less likely to engage in close relationships or to have relationships in which they do engage succeed.

While distrust can be damaging at an interpersonal level, there are functional aspects of distrust that cannot be discounted. For adults and children alike, distrust can prevent them from being blind to the failings of others or failing to perceive cues that point to others' untrustworthiness. A moderate amount of distrust also allows individuals to create boundaries with others, knowing when to trust and when to exercise caution, allowing for the possibility of building higher and deeper levels of trust or confirming that another person is not worthy of trust.

Regardless of whether or not distrust is examined from the perspective of children or adults, researchers agree that by and large distrust (and associated unhealthy attachment styles) is learned from individuals' experiences with others. This is good news, in the sense that it suggests that more positive, supportive, truthful experiences with others may be able to shape a distrustful person's perceptions of the world in more positive, hopeful, trusting directions.

### **Distrust at the Societal Level**

At a more global level, many aspects of society are based on an assumption that distrust is an important and valuable characteristic in its citizenry. Democratic states, for example, are premised on the idea that the people in power will be tempted to abuse it. For this reason, checks and balances are put in place to dissuade those in power from succumbing to those temptations. For example, in the U.S. Constitution, the executive, legislative and judicial branches of government are given the power to veto each other's decisions, while Canada's Constitution states that both the Senate and the House of Commons must separately approve bills in order for them to become law. These measures allow the citizenry the security of knowing that there is oversight on matters of public importance and that no single branch of government becomes too powerful.

Distrust also serves to involve citizens in the political arena. When people distrust institutions, believing that governments and corporations are corrupt, or at least potentially corruptible, they are more likely to actively engage in politics. This may manifest in increased voter turnout for elections, lobbying for causes, or protesting perceived or actual wrongdoings by those in power. These actions, although they are based in distrust, can serve to improve life for both those directly involved and those around them.

At the societal level, distrust can develop in at least one of two ways. In situations where valuable resources are scarce (e.g., food shortages and fuel crises), individuals are motivated to protect themselves and those closest to them before others. The motives of others trying to join the group are often questioned, and once in the group, the slightest indication of untrustworthiness will often result in expulsion and exclusion from these important

resources. Distrust can also develop in the face of concerns about social loafing. This refers to occasions when an individual or individuals in a group do not put forth maximum effort on a joint task, expecting the remaining group members to “pick up the slack.” In ways similar to the scarce resource scenario, social loafing is a sign that individuals cannot be trusted to keep the group’s greater good in mind, which violates the trust of others, presumably fully engaged group members. Social loafers who have violated the group’s trust will at best be carefully monitored and made accountable for their productivity or lack thereof, or will be expelled from the group entirely.

### The Impact of Distrust on the Individual

It would appear that distrust can be both dysfunctional and functional. Like most other aspects of life, too much distrust can be isolating, while too little can result in being taken advantage of by less scrupulous others. It would be a mistake to assume that trusting people are gullible, whereas distrusting people have better “trust radar.” In fact, distrusting individuals are worse judges of character because their negative experiences lead them to regard many or all people with suspicion, leaving them unable to accurately differentiate between those who are trustworthy and those who are not. This inability or unwillingness to extend the benefit of the doubt (in a world that is actually quite trustworthy) has been associated with lower life satisfaction, commitment, and motivation, and even a shorter life expectancy.

Though the vast majority of research details the negative impact that distrust has on both mental and physical health, there is at least one set of circumstances in which being distrustful may actually prolong life. Safe or defensive driving is premised on the idea that others on the road cannot be trusted. While trust may be placed in the systems that control traffic, such as traffic lights and road signs, trust should not be placed in other drivers, who almost certainly have a different agenda, schedule, and understanding of their place on the road than may be understood by others. The tendency to assume that other drivers can read minds and know that a vehicle is about to turn left (without the benefit of turning signals being used) has led to many automobile accidents. In these cases, distrust may actually be

life-extending for more than just the trust-wary individual.

## Dog–Human Deception

Deception in dogs (*Canis familiaris*) is a relatively new topic in cognitive research, yet there has been considerable anecdotal evidence suggesting that dogs are capable of deception. Dogs were overlooked in early research, perhaps because of their domestication, and perhaps because early “dog artists” tricked ethologists into believing that their dogs were capable of extraordinary abilities, such as counting, by giving the dog minute cues.

During the 20th century, however, dog ethology began to make a comeback and research to date has shown that dogs possess exceptional social cognitive abilities, particularly involving humans. Dogs make excellent candidates for deception research because of social cognitive skills gained through ancestral influence from wolves (*Canis lupus* subsp.), selection during their domestication, and their long history of living alongside humans. The research to date has focused on deception in play between dogs and humans and has provided evidence that dogs are deceptive. Little research, however, has looked at deception or its detection between dogs and humans in contexts other than play.

Wolves, the most likely ancestors of dogs, live in complex, dynamic social systems that greatly vary in size; packs of two to 42 individuals have been reported. A complex social system forces the evolution of skills that enable individual wolves to remember past interactions with others and to use this information to predict and possibly manipulate the behaviors of those around them. These adaptations for social living were likely passed on to dogs throughout their evolution.

Further pressure for social cognitive skills came from the domestication process, during which humans selected those dogs that had a better understanding of human communicative behavior, which was necessary for coexisting with, and especially working alongside, humans. Dogs typically outperform wolves in social cognitive tasks, supporting the notion that domestication has had a significant influence on dogs' understanding of human behavior.

Today, dogs are present in almost every human society worldwide and have the opportunity to learn from humans from a very young age. Even as puppies, they demonstrate a level of understanding of human gestures that is superior to wolves and most other animals. Dogs' exceptional capacity for utilizing human-given cues suggests that they have the skills necessary for exhibiting deception involving humans.

### Deception in Play

Dogs' understanding of human behavior is critical for deception to occur between the species because it allows them to use even the smallest cues to predict future actions. This happens especially in play. For example, if a human acts as though he or she is preparing to throw a ball far, the dog will turn around and sometimes move toward where it believes the ball will land. The deceptive human capitalizes on this behavior and only pretends to throw the ball, fooling the dog. The frequency with which deception occurs in play and the different deceptive behaviors exhibited by both dogs and humans have been most notably studied by Robert W. Mitchell and Nicholas S. Thompson.

Deception in play between dogs and humans, while possible because of the ease of predicting future actions, often occurs because each side has its preferred activity. Both dogs and humans attempt to manipulate the other in a way that shifts the

type of play closer to their ideal. Honest and dishonest versions of behaviors will be seen throughout play between any individuals, yet research has suggested that deceptions are more frequent when the dog and human are familiar with one another, perhaps because both are better able to predict the future actions of a familiar partner.

One way that dogs display deception is by bringing a toy near a person (either carrying it in their mouths or dropping it on the ground), and then taking it away as soon as the person reaches for it. In these situations, the dog would prefer to remain in control of the toy, but recognizing that the person will become bored and stop participating in the game, the dog manipulates the person into re-engaging in play. Similarly, dogs will sometimes run toward a person, and then change direction; getting close but remaining out of reach. This is often done when the dog wants

*One way that dogs display deception is by carrying or dropping a toy near a person and then snatching it away as soon as the person reaches for it. In these situations, the dog manipulates the person into acting in vain, thus re-engaging in play.*

to be chased, again attempting to engage the person in the activity. The goal of these behaviors is to cause the human to act in vain—reaching for the dog or an object that they will not be able to acquire.

People exhibit similar deceptive behaviors, and others, such as manipulatively petting a dog who has a toy in its mouth, causing it to relax its grip, allowing the person to steal the toy. The high frequency of deceptive versions of certain acts allows for easy recognition by both dogs and humans, yet even between familiar partners, the deceptions are successful most of the time. However, the ease of recognition of a manipulative behavior has caused both dogs and humans to develop counterdeceptive strategies to avoid being deceived. For example, dogs may avoid being fooled by the human pretending to throw a ball by watching until the ball has left his or her hand before turning around to chase it. This shows that dogs are capable of identifying and responding appropriately to deception in some cases.

The ability of dogs to detect deception outside of play has not been thoroughly investigated, and the little research that has been done has not yielded promising results. Although dogs appear to recognize when they are being misled, they still respond to deceptive cues, perhaps because of a strong need to obey. In any case, while the results from the research on play have supported the hypothesis that dogs understand deception, further research is needed to determine the extent of that understanding.

### Conclusion

Dogs make great candidates for deception research because of their social ancestors, selection for an understanding of human behavior during domestication, and their long history of living alongside humans. Much of the research to date has focused on dog–human deception in play and has yielded promising results, but further research is necessary to determine the true range of dogs' ability to deceive and resist deception.

## Dot-Com Bubble

The dot-com bubble (also referred to as the Internet bubble) is the name given to the speculative bubble, lasting between 1995 and 2000, that centered on new Internet-based companies. For these years, "prefix investing" in companies beginning with "e-" or ending with ".com" resulted in soaring stock prices. The beginning of the bubble can be traced back to the introduction of the World Wide Web and the subsequent new market for Internet-related startups. Economies worldwide saw stock prices increase in Internet-related fields.

On March 10, 2000, the bubble reached its zenith with the NASDAQ Stock Market hitting 5132.52. Despite the resounding hype around the new industry, investor deception plagued the period of the bubble. Deceptive acts and behaviors, including investor self-deception, deceptive revenue models, and misleading sentiments on Wall Street were prevalent during the bubble.

### Market Bubbles

In general, market bubbles are characterized by an overmagnification of a particular market due to inflated confidence of its value by current buyers. This creates a hyperbolic disparity between the value at which companies are traded and their intrinsic worth. In the case of the dot-com bubble, company values were driven by investor interpretations of market sentiment, rather than traditional valuation techniques. For this reason,

market bubbles are generally not detected until market sentiment dramatically drops. The result of the impact of investor expectations, compounded with the fact that it is often difficult to place a hard numerical value on technology companies, was that Internet companies received valuations that far surpassed their true value. When the rising expectations turned downward in the spring of 2000, the dot-com bubble fell in line with the typical “bursting” trait of stock bubbles.

### **Investor Fraud**

Investors were frequently misled regarding alleged positive prospects of a company. Investors, eager to reap the potential rewards of high-growth equity investments, convinced themselves that these prospects would eventually come to fruition.

One example of investor deception was InfoSpace. At its height, InfoSpace was worth \$31 billion. Once the company deteriorated, an investigation attributed much of the company’s success to fraud and deception. The investigation sifted through company e-mails and confidential documents and discovered that revenue came from nonexistent transactions and accounting tricks. The higher-than-actual advertised revenue fooled everyone, from Wall Street traders to private investors.

A second example was Think Tools AG, a giant in the European dot-com space. In March 2000, Think Tools AG had a market valuation of CHF 2.5 billion. Founded as a consultancy company, Think Tools AG expanded to include a suite of product tools that ultimately was not capable of its promised and marketed features. Ad campaigns went as far as falsely citing Nelson Mandela for successfully using the tools. Consequently, the stock soared. Once misleading information was revealed, such as the fact that reference clients at the time of the company’s initial public offering did not even use the Think Tools Suite, the stock price plummeted.

### **Self-Deception and Stock Options**

Self-deception was also prevalent during the dot-com bubble. An important example of this self-deception was the operation of stock options. Because cash is not always available in Internet companies, stock options are offered as a form of payment. In some cases, stock options can convert

into a fortune. In many cases during the bubble, however, these options were meaningless.

Executives took advantage of the situation by compensating employees through coveted options that had a slim chance of garnering worth, let alone ever being exercised. During the bubble’s rise, these options worked. If the company did well, the founders made millions and the employees were paid. As the bubble began to burst, however, employees’ stock was worthless and founders bore no risk.

By replacing cash-based salaries with stock options, executives deceived their employees by creating a false sense of wealth that was predicated on the slim possibility that the company would succeed. Employees, in turn, spent outside of their means. InfoSpace chief Naveen Jain, for example, was known to give employees overly large stock-option packages. Although they sounded bountiful, 100,000 options eventually equated to a mere penny.

### **Risky Revenue Models**

Revenue models provided to investors during the bubble were frequently deceptive. Many Internet companies did not have accurate market metrics, such as price-to-earnings (P/E) or enterprise value to earnings before interest, tax, depreciation, and amortization (EV/EBITDA) ratios. Companies often did not have sufficient positive free cash flows to the firm (FCFF) to base future projections. Instead, companies offered claims around technological advances and early extraordinary stock performances. An emphasis on less traditional benchmarks, such as user acquisition, over more standard marks of success, such as revenue, became the norm. Companies filed initial public offerings on the basis of page views and user retention, which significantly differed from more traditional qualifiers, such as projected cash flows or weight average cost of capital (WACC).

With this focus and precedence placed on many factors above a financially profitable revenue model, many business models were inherently deceptive. Companies were able to give the illusion of success and the promise of profitability by producing highly scalable new metrics. Such metrics had a riskier and less documented conversion rate to financial gains.

### Lazy Susan Deals

Lazy Susan deals involve companies that invest in each other. For example, company X may invest \$10 million in company Y. Company Y would then turn around, like a lazy Susan, and invest \$10 million in company X. The value of the lazy Susan deal was that companies raising a round of financing were associated with bright prospects. The act of investors committing money to an idea was thought to positively correlate with success. In this case, companies deceived outsiders by making it seem as if they were procuring legitimate financing.

### Wall Street Speculation

Wall Street was a key driver of the inflation associated with the bubble. High stock prices set around initial public offerings and speculation leading to future skyrocketing prices defined the dot-com bubble. Analysts at large institutional banks wrote glowing reports and made overly optimistic comments about these new technology companies. Some of these reports, however, differed from the personal thoughts and beliefs of their authors.

In one example, Henry Blodget, one of the highest-ranking analysts at Merrill Lynch at the time, was cited for privately saying that InfoSpace was junk and potentially a major scam. However, in public, he gave the stock the highest rating possible. After a long investigation, Blodget's skepticisms were confirmed. Nevertheless, InfoSpace peaked at \$1,305 per share, which valued the company higher than Boeing. A year later, the price dropped to \$22 per share.

One sufferer of Blodget's false rankings, pediatrician Debasis Kanjilal, sued Merrill Lynch. In news coverage of the case, Kanjilal's lawyer, Jacob Zamansky, was quoted as saying, "The analysts have lied to the public investors. This case will make them accountable." Although the case was settled outside of court, this was the first major public case in which a Wall Street firm made a payment as reparation for an analyst's recommendation.

Wall Street bankers also convinced some of the technology companies to use their overvalued stock prices to increase their market share and power, which spread the risk to other sectors of the economy. One such merger was American Cable and Time Warner. In January 2000, only

months before the market crashed, American Cable acquired Time Warner for \$160 billion, the largest corporate transaction in history at the time. Instead of paying even a dollar, however, American Cable financed the entire purchase through the issuance of its stock to existing Time Warner stockholders. When the stock price of American Cable crashed months later, the recently issued stock lost billions of dollars in value in mere days. This transaction was later referred to as "the worst [merger] in history." The tragedies of the bubble continued with the unveiling of many fraudulent practices.

Abroad, Swiss public bank Vontobel was fined by the Swiss Federal Bank Commission for fraudulent acts related to Think Tools AG's initial public offering (IPO). In anticipation of a high post-IPO share price, Vontobel, which issued Think Tools AG's IPO, held on to a majority of the shares that should have been sold at the IPO. Vontobel hid these initial plans and then sold these shares once the stock price had risen. Such behaviors, both on Wall Street and internationally, prolonged the bubble by sustaining companies and keeping them "alive."

### After the Bubble Burst

The U.S. Securities and Exchange Commission fined many top investors, including Citigroup and Merrill Lynch, on the basis of fraud and deception to their investors. Specific abuses included favoritism and selective disclosure. Moreover, related industries, such as advertising and shipping, were forced to downsize as demand for their work significantly fell.

Some companies that had actual intrinsic value, such as Amazon and eBay, weathered the storm and proved their viability. Others, such as Google, emerged to become some of the strongest and most powerful companies in the world. Nevertheless, aside from these outlier success stories, the lies and deception of the bubble left lasting damage.

## Dreyfus Affair

The Dreyfus Affair is a political scandal that occurred in France at the turn of the 20th century. Involving allegations of anti-Semitism, nationalism, deception, forged documents, perjury, honor, and espionage, the debate over the Dreyfus Affair polarized France and shook the French military. Resolved after a dozen years, the Dreyfus Affair still engages those fascinated by group dynamics, conspiracies, discrimination, and devotion to hierarchy and order.

### Background

Alfred Dreyfus was born in 1859 in Mulhouse, located in the Alsace region of France. The son of a Jewish textile manufacturer, Dreyfus entered the École Polytechnique in 1882, ultimately deciding upon a career in the military. Promoted to the rank of captain in 1889, by 1894, Dreyfus was assigned to the War Ministry. At that time, Jean Conrad Sandherr, the chief of the army's counterintelligence unit, became aware that someone was passing information regarding the new French artillery system to an attaché of the German embassy. Dreyfus, who was a member of the French General Staff and had access to the information, soon fell under suspicion. Arrested and charged with treason, Dreyfus was soon brought to trial.

Dreyfus's trial was highly irregular, and he consistently maintained his innocence. Dreyfus was ultimately convicted, with his verdict based upon a letter procured from the German embassy by a French agent that indicated Dreyfus's involvement in the scheme. This letter was brought forth by Major Hubert Henry, who indicated that it had been written by Dreyfus in his own hand. The French newspapers generally supported Dreyfus's conviction, with strongly anti-Semitic editorials welcoming the verdict and indicating that Dreyfus's actions were representative of the alleged disloyalty of French Jews. Stripped of his military rank, Dreyfus was sentenced to life imprisonment and sent to Devil's Island, a penal colony located off the coast of French Guyana.

### Discovery of Dishonesty

Although the matter now seemed resolved, in 1896, Lieutenant Colonel Georges Picquart, the head of French military intelligence, began to doubt Dreyfus's guilt. Picquart uncovered evidence that suggested that Major Ferdinand Esterhazy was engaged in espionage on behalf of the Germans, and he had the same opportunity to divulge military secrets regarding the French artillery as had Dreyfus. Picquart suggested that the incriminating letter that had helped convict Dreyfus was actually written by Esterhazy.

In response, Picquart was suddenly removed from his position because his superiors were staunchly anti-Dreyfussards (those who supported Dreyfus's conviction). While Picquart had uncovered evidence demonstrating that another person had committed the crime, the military preferred Dreyfus as the villain because he was Jewish and Alsatian. Dreyfus's cause, however, was quickly gaining support in important quarters, including journalist and future premier Georges Clemenceau and Senator Auguste Scheurer-Kestner. As a result of these Dreyfussards (those who believed Dreyfus's innocence), Esterhazy was brought before a court martial because of Picquart's allegations.

Esterhazy's trial soon descended into chaos. Facing Picquart's charges, Esterhazy created new evidence for the court martial and spread a series of rumors that made their way into the newspapers, questioning the patriotism of those who supported Dreyfus. Henry, who had brought forth the original letter implicating Dreyfus,

now produced new, more recently forged documents. Esterhazy's trial, which took place on January 10 and 11, 1898, resulted in his acquittal and sparked a series of anti-Semitic riots in Paris. In response to the acquittal, novelist Émile Zola hastily wrote an essay, *J'accuse*, which was printed on January 13, 1898, on the front page of *Aurore*, Clemenceau's newspaper. In this essay, which sold over 200,000 copies of *Aurore* in one day, Zola accused the French government of anti-Semitism, proclaimed Dreyfus's innocence, and demanded a new trial.

Zola's essay inflamed the passions of the anti-Dreyfussards. Members of the French parliament were pushed to bring Zola to trial for libel, and he was tried in February 1898, found guilty, sentenced to a year's imprisonment, and fined 3,000 francs. Picquart was accused of forging some of the documents used at the second trial, and he was threatened with a court martial, at which time he resigned his commission.

Meanwhile, the Dreyfussards circulated a petition demanding a new trial for Dreyfus, collecting over 3,000 signatures and gaining the support of many French intellectuals. In August 1898, Henry committed suicide shortly after confessing to forging many of the documents that implicated Dreyfus, and Esterhazy fled to Belgium before ultimately settling in the United Kingdom. After Henry's confession, Dreyfus's appeal sped through the system, and it was inevitable that a new trial would be granted. Dreyfus was brought back from Devil's Island and retried before a military court. Because the French military found it embarrassing to admit that it had wrongly convicted Dreyfus, he was again found guilty. In an effort to resolve the matter, French president Émile Loubet pardoned Dreyfus. Despite this, Dreyfus was adamant that he was innocent, and he continued to work to prove his innocence.

### Resolution

In 1904, Dreyfus was granted a new trial, and in 1906, a civilian court heard his case for the first time. This time, Dreyfus was found not guilty, and all of his previous convictions were reversed. The French parliament reinstated Dreyfus in the army, restoring his rank, and he was made an officer of the Legion of Honor. Dreyfus was soon promoted to the rank of major and then retired, although

he returned to active service during World War I and was again promoted to lieutenant colonel. Dreyfus then retired again, and he died in 1935. Picquart's career was also rehabilitated, and he ultimately was promoted to the rank of brigadier general and later served as minister of war in Clemenceau's first cabinet.

The Dreyfus affair brought to a head the conflict between those who favored nationalism and respect for order and authority and those who sought to protect individual rights and sought the protection of diverse religious beliefs. The desire of the military and by extension the French government to adhere to untruths, rather than admit a mistake made many rethink the value of nationalistic behavior and blind adherence to authority. The speed with which the courts and the public were willing to assume Dreyfus's guilt as a result of his religious background also caused many to rethink the links between church and state in France.

Although the split between those who approved of Dreyfus's conviction and those who wished it overturned continued for decades, the Dreyfus Affair contributed to the 1905 passage of legislation separating church and state in France. Hungarian journalist Theodor Herzl, who had covered Dreyfus's original trial, became so disillusioned by the conviction that he founded the World Zionist Organization, which called for the creation of a Jewish state in Palestine. The Dreyfus Affair remains an important example of how individuals may suffer when faced with government officials who favor order over truth.

## Drug Advertising

Deception in drug advertising has been documented in print, radio, and television, while deception has been exposed in scientific reports published in medical journals and conferences. The Prescription Drug Marketing Act of 1987 governs the legality of deceptive or misleading ads published by the pharmaceutical industry. Several forms of deceptive advertising have been examined.

### Deception Aimed at Doctors

Both consumers and doctors can be deceived with drug advertising. One important form that targets doctors is deceptive reporting of drug testing. Drug companies that fund their own studies have been found to manipulate data in several deceptive ways that lead to misleading publications. One method is to not report results with negative implications for the drug. This approach deceives doctors because they are less likely to be aware of any potential negative side effects. Another method is to not report null results, which show no difference between the drug and a control condition.

Studies have revealed that the likelihood of a positive drug study being published is significantly higher than one in which the drug is shown to have no effect. This bias is deceptive because it can also mislead doctors into believing that the drug has a stronger effect than it actually does. Another tactic for biasing scientific perceptions of a drug involves overemphasizing a positive study's results. This is done by submitting the results multiple times under the guise of being numerous independent studies. The effect of this deception is that doctors and other health care professionals will read different articles assuming that the cited studies are based on different data, producing a deceptively positive view of the drug.

A related form of deceptive drug reporting is the use of ghostwriting in scientific reports. A

person reading an article by a prominent physician or researcher expects that the report reflects the opinions and findings of the person cited as the author. Specialized firms, however, are sometimes contracted to write positive reports about a drug. Scientists, physicians, and other researchers are then contacted and offered a sum of money to claim authorship of the article or review, without having actually written the endorsement of the drug. This results in published material from an apparent third party that can mislead other health care professionals.

### Deception Aimed at Consumers

Consumers can also be the targets of deceptive drug advertising. Until the 1980s, drug marketing was focused on medical professionals who controlled prescriptions. In 1981, the pharmaceutical industry successfully advocated to the U.S. Food and Drug Administration (FDA) that consumers needed to be informed about potential medication that could treat their illness. The government reversed the position taken in 1938 with the Federal Food, Drug, and Cosmetic Act. The FDA allowed pharmaceutical companies to market their drugs directly to the consumer. Since then, mass marketing and direct-to-consumer (DTC) advertising has dramatically increased. Drug companies reportedly spend over one-third of their budgets on the advertising and marketing of prescription drugs.

DTC advertising, however, has been plagued with inaccuracies and deceptions since the practice was made legal. The FDA monitors drug advertisements and marketing material for signs of deception and misleading statements. Drug marketers are required by law to submit ads for approval prior to placing them in the public sphere; approval by the FDA allows an ad to run in the specific format that it was presented. Enforcement of this procedure has been relatively difficult and ineffective. For example, an advertisement may be placed in a journal without approval, but it can take up to 10 weeks before the FDA sees the advertisement.

Deception in consumer advertising typically involves the appearance of misleading statements or descriptions associated with off-label use. Off-label use is the promotion of a drug that is inconsistent with guidelines set forth by the FDA.

*This advertisement for desPlex appeared in the June 1957 issue of the American Journal of Obstetrics and Gynecology. Even though evidence of synthetic estrogen's serious harm to a fetus surfaced as early as 1953, it was heavily marketed to physicians for decades, who continued to rely on drug company information.*

When a pharmaceutical company develops a new drug, the FDA must approve it for specific treatments based on evidence that includes laboratory and clinical trials. A drug may not be marketed for any use that is not explicitly defined by the FDA. Examples of tactics that are used to mislead consumers include deceptive images, lack of warning about side effects, overexaggerating the effectiveness of the drug, and insinuating that the drug is the best available. Unless there are specific studies that can support the claims made by the ad, the ad is deemed misleading and is determined to be illegal.

Drug advertisements also tend to exaggerate the benefits of a product while downplaying the negative effects to a consumer. Deceptive tactics used by drug ads involve the use of large fonts touting the effectiveness of the drug, while side effects are relegated to small print that is hidden

in the corner of the page or as a small Web link that forces an individual to search for conflicting information.

Deceptive imagery is also a common method of misleading the consumer. Depicting a family in a drug ad, even though the drug is only approved for adults aged 18 years and up, can be deceptive, insinuating that the product is safe to use for the whole family. Ads tend to use spokespersons who endorse the drugmaker's claims about a drug's efficacy. For example, drug manufacturer Pfizer used Dr. Robert Jarvik as the spokesman for the drug Lipitor. In the television ad, Jarvik was introduced as the inventor of the artificial heart, depicting him as an authority on cardiovascular issues and medical advice. The advertisement, however, failed to mention that Jarvik was not licensed to practice medicine. The advertisement depicted Jarvik as a user of Lipitor, though he later admitted to using Lipitor only after he became a spokesman. In addition, the ad showed Jarvik rowing a boat, when in fact the man rowing was a body double. By presenting Jarvik as a physically fit individual, the ad might have misled consumers into believing that a drug may have additional positive side effects. The Lipitor ad was pulled from circulation after these facts came to light.

Another example is Johnson and Johnson's citation by the FDA for promoting off-label usage of Ertaczo. Ertaczo is an antifungal cream used to treat symptoms of athlete's foot and similar fungal infections. The wording of the Ertaczo advertisement used large, bold letters to emphasize the effectiveness of the drug. The drug claimed to "Crush. Kill. Destroy." This overstated the efficacy of the drug compared with the clinical trials that Johnson and Johnson presented to the FDA. The use of hyperbole was an attempt to mislead the consumer because the clinical study showed effectiveness in only 22.3 percent of patients. This ratio of success did not match the claims made by Johnson and Johnson in its advertising.

Web sites can also contain deceptive drug advertising. Allergan was cited for a misleading advertisement in the design of a Web site for the eyelash-enhancing product Latisse. Among the reasons cited, the FDA noted that even downplaying certain side effects amounts to deception

in advertising. The Latisse information on the Web site minimized the negative effects of the drug while exaggerating its beneficial effects. By not displaying adverse reactions as prominently as positive effects of the drug, the pharmaceutical company sought to mislead the consumer. The complaint against Allergan is important because it addresses multiple media outlets as part of a larger marketing campaign.

Finally, deceptive drug advertising can also involve counterfeit or adulterated drugs. The Prescription Drug Marketing Act of 1987 sought to regulate pharmaceutical advertising and to ban the sale of counterfeit drugs. The law requires all advertising to be truthful and not misleading, based on clinical research and substantial evidence. This legislation was a result of the appearance of a grey market for prescription drugs that developed in the 1980s. Promotional practices such as coupons for free drugs were disallowed and the resale of wholesale drugs sold to health care entities was banned.

The main mechanism for prosecuting deceptive marketing by pharmaceutical companies is the False Claims Act. Because of the expansion of programs such as Medicaid and Medicare, the scope of recent legislation has been effective in prosecuting pharmaceutical fraud and deceptive practices. Regulation of the pharmaceutical industry under the umbrella of the False Claims Act and the intense marketing of drugs for off-label use has resulted in major settlements by pharmaceutical companies.

Deception in drug advertising is practiced in multiple forms and through a variety of media. Medical journals are a medium of deception targeted toward doctors and other health care professionals. Pharmaceutical companies mislead health care providers by manipulating and hiding the results of clinical research trials. DTC advertising, although regulated by the FDA, is a prominent form of deception in drug advertising in many media. Different media present challenges to the FDA in order to ensure compliance with the law.

The FDA enforces legislation related to deceptive practices used in drug advertising, but enforcement is difficult, and penalties are not immediately imposed. Pharmaceutical companies and the FDA will face increasing challenges as the avenues for

disseminating drug information to doctors and consumers change with new technology.

## Drugs

The term *drug* is typically used in the English language to colloquially refer to substances that interact with the human body or psyche, and as a class are generally divided between licit and illicit substances. The modern approval process for licit drugs has been critiqued as inherently biased, and thus antithetical to the spirit of scientific research that undergirds its legitimacy. For example, the beneficial impact of the drugs are sometimes overstated, while their attendant risks are minimized to increase sales and, in turn, shareholders' earnings. In addition, the process whereby physicians and pharmacists are offered incentives to show allegiance to particular brands or classes of drugs is coercive. Illicit substances (colloquially referred to by the generic moniker "drugs," and typically

psychoactive in nature) are often comingled with elements of lying and deception both in the form of (1) manufacturers, distributors, and users, who tend to do so clandestinely; and (2) law enforcement agencies, government institutions, and others, which seek to vilify both substance and user on the basis of dubious ideologically driven rationalizations.

### **Licit Drugs**

Organized medicine in the United States faces distinct challenges with regard to the declining public trust of its patrons because of publicized instances of deceptive, dishonest, and fraudulent practices. Consequently, dependent financial relationships and lapses in ethical decision making have allowed for an erosion of trust between drug companies, physicians, and patients. After a highly publicized U.S. National Institutes of Health-funded biomedical research scandal in the late 1970s, public attention prompted the government to increase its efforts at addressing scientific misconduct in the pharmaceutical industry. As a consequence, the government since the 1980s has taken a more active role in regulating the medical field.

Despite these efforts, outright fraud in the pharmaceutical industry remains commonplace and takes many forms. For example, in 2009, pharmaceutical manufacturer Pfizer was forced to pay \$2.3 billion for kickbacks and off-label marketing. “Off label marketing” refers to the marketing of a drug for use in conditions outside of those for which it was explicitly approved. After the global health care company Glaxo-SmithKline was charged with fraud for knowingly marketing contaminated medical products, the company was forced to pay \$750 million to settle the case in 2010. In July 2012, the same company had to pay \$3 billion under the False Claims Act for behavior ranging from the fabrication of scientific research, kickbacks to physicians, bribes, and the use of off-label marketing for several of its drugs, including Paxil, a popular and widely used antidepressant of questionable medical utility, particularly in light of its dangerous side effects. These examples, among a steady flow of other recent cases, serve as evidence that the regulatory framework of the pharmaceutical industry is inadequate.

Bringing a drug to market is an expensive, lengthy, opaque process, sometimes costing hundreds of millions of dollars from the moment of a drug’s conception until it can be prescribed by physicians. Most of the clinical trials conducted in the United States are funded by the pharmaceutical industry, and systematic analyses have shown that in some cases this process is fundamentally flawed. Medical journals have been reported to derive some (or most) of their revenue from corporate advertising, and these publications are not universally required to disclose any conflicts of interest among editorial board members. Some pharmaceutical researchers have been reported to hide or refuse the publication of studies that would negatively impact drugs under development. This basic conflict of interest undermines the ethicality of pharmaceutical research and calls into question the empirical validity of supporting studies.

Conflicts of interest also materialize in the direct influence that drug companies have on prescription-writing behavior. The most direct form of influence comes in the form of kickbacks—monetary incentives directly given to physicians for prescribing certain drugs. Gifting is a more common form of influence, and it involves pharmaceutical corporations awarding doctors gifts that vary from resort vacations to sporting event invitations and medical supplies. Despite being prohibited, the behavior has become normative. Another common (and widely accepted) form of industry influence occurs through its funding of medical organizations. In most cases, this type of funding is either unregulated or self-regulated, presumably to limit conflicts of interest or the appearance of such conflicts. However, many of these organizations would struggle to remain financially viable without industry funding, indicating the degree to which there is a vested interest in minimizing the appearance of potential conflicts of interest.

Pharmaceutical companies have also taken advantage of the Prescription Drug User Fee Act of 1992, which allows drugmakers to pay a fee to expedite the drug approval process. The initial push for this legislation occurred in the 1990s in response to the burgeoning global acquired immunodeficiency syndrome (AIDS) pandemic, at a time when urgent demands for treatment were

hindered by a lengthy FDA approval process. Since then, many drug companies have capitalized on the act by pushing for the hasty approval of drugs that are not life-threatening, incrementally creating an environment in which drug companies are given increasing power to pressure the FDA approval process.

Lying and deception can also play a role in influencing perceptions of the pharmacological power of drugs. The pharmaceutical industry remains profitable because its drugs are purported to have a positive effect on some physiological anomaly, a condition undermined by the power of the placebo effect. One of many examples of placebo fraud is found within the psychiatric antidepressant industry. In one systematic analysis, it was shown that drug companies refused the publication of 40 percent of clinical trials that demonstrated little to no medicinal value with regard to their psychiatric drugs, while vigorously promoting the drugs as effective in marketing campaigns.

Dietary supplements represent perhaps the largest category of placebo fraud. Because this category of drugs is not subject to FDA approval, dietary supplements completely bypass the drug approval process and solely rely on the strengths of biased self-regulation to ensure the validity of research regarding their medicinal value and the truthfulness of marketing campaigns with regard to their efficacy. Consequently, the FDA has had to recall hundreds of these drugs on the basis of exaggerated claims of their medicinal value in controlling body weight, enhancing the physique, or increasing sexual vitality.

### Illicit Drugs

Illicit psychoactive substances are clandestinely manufactured, distributed, and used, and in postindustrial society, this phenomenon dates to the once burgeoning opium trade in Asia. Illicit psychoactive substances have served as the well-spring of clandestine enterprise (e.g., black market breweries and speakeasies during the era of alcohol prohibition), and the term *trafficking* has become accepted as a moniker of the clandestine drug trade. Similarly, other words in the English language have been co-opted as terms used within clandestine drug markets; for example, the terms *cooks*, *mules*, and *dealers* have been adopted to

deceptively reference the varying individuals who play a role in the manufacture and distribution of illicit drugs.

The use of illicit psychoactive drugs often involves elements of lying and deception, due primarily to the clandestine nature of engaging in socially prohibited behavior; however, this was not the case in previous historical epochs divested from the prohibition of these substances. Because of the illegal nature of these substances, entire industries have been developed that aim to conceal a user's involvement with illicit psychoactive drugs. For example, products are marketed that allow users to circumvent drug tests (typically administered by employers or formal authorities) that are designed to determine prior use of illicit psychoactive substances. Related to the clandestine use of illicit psychoactive substances is the primary reason for their concealment: the desire to prohibit possession and use of the substances by law enforcement agents, government institutions, and critics of illicit drug use.

With regard to the criminalization of illicit psychoactive drugs, individuals and institutions wishing to prohibit their use have often employed ideologically driven reductionistic arguments concerning the negative impacts of these substances—both personal and societal—in an effort to demonize and vilify both substance and user. The history of the prohibition of psychoactive drugs in Western society is related to the importation of opium from China, and some have likened that early movement—and its attendant rhetoric—to a form of xenophobia in condemning both Asians and the drug. Soon thereafter, a puritanical outlook on the use of psychoactive substances became the norm within Western societies, essentially positing that any use of psychoactive substances constituted an evil that was tantamount to a disease called “addiction,” for which there was ostensibly no cure.

Historically and contemporarily, the criminal justice approach to the control of illicit psychoactive substances is often predicated upon a rationale that also involves elements of deception and lying. There are many historical examples in which the findings of empirical research about the psychopharmacological impact of substances deemed illicit have been eschewed in lieu of adopting policy formulated on the basis of ideologically

driven, reductionistic arguments centered on either (1) the demonic effects of the substance on the body, or (2) xenophobic arguments centered on the deleterious social impact of a villainous drug-using population on the body politic.

The White House Office of National Drug Control Policy has declared the purported negative effects of illicit psychoactive substances with little regard to (or often in defiance of) the findings of empirical peer-reviewed scholarship. At times, a policy of zero tolerance prohibiting the possession of any amount of illicit psychoactive substances has been adopted, which has occasionally resulted in grave injustice. For example, school children have been criminally charged with drug dealing for taking over-the-counter headache medicine into schools that had adopted a zero tolerance policy, and as a result, mitigating circumstances were disregarded. In defiance of historical evidence to the contrary, these actions are usually justified vis-à-vis nonfalsifiable metaphorical statements that having zero tolerance prevents society from falling down a “slippery slope” that leads to the destruction of social order.

Many myths have also been perpetrated with regard to the negative impact of illicit psychoactive substances. Emblematic of this phenomenon is the purported negative impact of one of the most widely used psychoactive substances—marijuana. There is perhaps no greater rift between the findings of empirical research (which tends to indicate the psychopharmacological benignity of the substance) and the statements of authorities (which tend to suggest that its use is tantamount to the end of human civilization) than where it concerns the personal and social impact of marijuana. Despite empirical evidence to the contrary, one of the most pervasively perpetuated myths surrounding the social impact of marijuana concerns its facilitation of the gateway effect, whereby it is alleged that use of marijuana inexorably leads to the use of more dangerous, harder drugs, for example opioids or cocaine. Other groundless myths habitually referenced by formal authorities and their supporters with regard to the effects of marijuana intoxication concern its impact on facilitating criminal behavior, its persistent negative impact on memory and cognition, and its chronic impairment of motivation and productivity.

The subtle processes that can influence drug policy—putting individuals and institutions seeking to prohibit their use in the position of supporting baseless perspectives on the impact of psychoactive substances—is illustrated by one of the largest systematic reviews of the empirical evidence concerning the social and psychopharmacological impacts of marijuana, conducted in Canada in 2002. After review of the evidence, the Senate Special Committee on Illegal Drugs recommended decriminalization of the substance, arguing that most of the negative impact of marijuana stemmed from its criminalization, not from the psychopharmacological impact of the substance. However, the Canadian government had to forego its recommendation when it was subsequently determined that enacting such legislation would stymie cross-border trade with its largest trading partner—the United States—because of the United States’ puritanical stance on psychoactive substances. Thus, economic imperatives indirectly influenced by the ideologically driven war on drugs held a coercive influence over the sensible revision of criminal justice policy based upon the findings of empirical research.

## Duchenne Smile

Smiling is a ubiquitous facial expression that begins in infancy and is widely understood to be a display of favorable emotions, such as pleasure. People who smile are viewed as trustworthy, friendly, and cooperative. The smile is a powerful social gesture that puts others at ease and convinces them that they are safe in the smiling person's presence. Those who take advantage of others through manipulation and deceit exploit this power by using a nongenuine smile to fool victims about their true intentions.

A genuine smile, known as the Duchenne smile, involves muscles around the eyes and mouth, whereas the fake smile, known as the non-Duchenne smile, only involves muscles around the mouth. People can differentiate between the two types of smiles; the cues that distinguish between the genuine and fake smile have also been quantified in a measurement tool and computer program.

A smile is a universal facial expression that is widely perceived as a conveyance of positive affect (emotion). People of all races, ethnicities, cultures, and religious affiliations interpret a smile as a gesture of friendliness, enjoyment, happiness, and amusement. A smile is displayed in the same manner across the globe. Even those born blind can spontaneously smile during pleasurable experiences. A precursor and successor to laughter, a smile can also reflect embarrassment, frustration, anxiety, and submissiveness, as well as a variety of other emotions ranging from sexual attraction and love to haughtiness, contempt, hostility, and vengefulness. Biologists conjecture that the smile has evolved in primates and humans as a primitive gesture of submissiveness, designed to placate potential enemies or predators. Known as the "fear grin," this protosmile involves neither a full baring nor clenching of teeth, which are signs of threat and aggression.

A wealth of research demonstrates the highly social nature of the smile. People who smile are

regarded as friendly, likeable, confident, trustworthy, and approachable. In addition, in various social situations, these people are more likely than nonsmiling people to receive positive responses to requests for assistance and cooperation. Hence, the smile has powerful and inherent communal currency. The act of smiling—even in the absence of other people—is associated with changes in the brain that can elevate mood and energy and reduce the body's responses to stress.

A genuine smile, known as the Duchenne smile, involves muscles around the eyes and mouth (as with Arizona Cardinals wide receiver Larry Fitzgerald, top), whereas the fake smile, known as the non-Duchenne smile, only involves muscles around the mouth (as with American singer and model Katrina Darrell, bottom).

The smile might also be essential to human survival. Infants' brains are wired to fixate their eyes on human faces and to mimic the expressions of others, including smiling. Appearing between 6 and 8 months of age, the smile is a powerful tool of communication for infants and their caretakers, helping to solidify bonds and prepare the infant for more sophisticated social interactions. The failure or inability to produce a smile or understand its meaning can signal the presence of developmental disabilities, sensory deficits, or autism.

Despite the universality of the smile, cultural norms differ with respect to the frequency of smiling and its interpretation, especially in public. For example, in Japan, people smile when they are angry or perplexed, or refrain altogether from public displays of emotion, such as smiling. In the United States, smiling in public is fairly common; in China, it is less so. In Russia, people regard smiling in public with suspicion. Therefore, perceptions of the citizens of these two countries about one another ("Americans are untrustworthy"; "Russians are unfriendly") have created longstanding views and misunderstandings, hampering relationships and fostering the "chill" of the Cold War era.

### Real Smiles and Fake Smiles

The production of a smile enlists muscles around the eyes (the orbicularis oculi) and mouth (the zygomatic major). The former lifts the cheeks and causes the eyes to squint, producing wrinkles known as "crow's feet" or "laugh lines," whereas the latter lifts the corners of the mouth, producing in its broadest expression a "toothy grin." A 19th-century French physician (neurologist) and scientist, Guillaume-Benjamin-Amand Duchenne, was the first to distinguish between smiles that involve one or both types of muscles. Named in his honor, the Duchenne smile engages both types of muscles (the orbicularis oculi and the zygomatic major muscles), whereas the non-Duchenne smile engages only the zygomatic major. The former is accompanied by a slight dip of the eyebrows and is more likely to be symmetrical than the latter. In addition, the Duchenne smile is more fleeting (five seconds) than the non-Duchenne smile, but the former emerges more gradually than the latter.

Numerous studies have shown that the Duchenne smile (the felt or real smile) is related to self-reported pleasure and other measures of enjoyment. The non-Duchenne smile (the unfelt or fake smile) is unrelated to enjoyment or other favorable emotions. The real smile is reflexive, spontaneous, authentic, and instantaneous. The fake smile exhibits opposite qualities; for example, it is forced, deliberate, and artificial, and is seldom indicative of genuine enjoyment or friendliness.

However, the non-Duchenne smile can express civility and courtesy, for example, among passersby on the sidewalk, between a librarian and patron, or between cashier and customer. Employees in retail outlets, fast food establishments, and restaurants are encouraged (or trained) to smile in order to increase sales and patronage by eliciting the positive effects of smiling on others. The fake smile can alleviate tension in awkward social situations, accompanying an apology for an accidental step on the toe in the subway or an inadvertent jostling in a crowded elevator.

Although the differences between the Duchenne and non-Duchenne smile can be subtle, studies have shown that people perceive these nuances of expression and can distinguish one from the other. Researchers at the Massachusetts Institute of Technology even programmed a computer to accurately differentiate the real from the fake smile; such software could be applied in law enforcement investigations to detect signs of lying and in the marketing field to detect consumer preferences. Professor Paul Ekman of the University of California, San Francisco, developed the Facial Action Coding System as a quantitative measure that can be used by researchers to distinguish between a genuine and a fake smile.

The fake smile has been exercised to manipulate others for selfish and criminal gain. The deliberate use of the non-Duchenne smile to disarm enemies or potential victims is part of conventional wisdom and has been incorporated in popular culture. The villainous smile—as widely depicted in movies and animated features—belies the true intentions of the evil perpetrator. The power of the smile to disarm and confuse people regarding one's true malicious intentions likely stems from the communication value of the fear grin as a means to project submissiveness and harmlessness.

Easy to effectuate and associated with socially desirable meanings, the fake smile can be used in a variety of situations that entail deceit, fraud, and violence. For example, a lie coupled with a fake smile is intended to convey truthfulness. Con artists and scammers employ the fake smile to confuse victims about their true intentions. One who applies the smile as a deceptive tactic capitalizes on the fact that the smile is generally associated with kindness, affection, and trustworthiness. Smiling people are favorably viewed in terms of numerous personality traits that cast them in a positive and nonthreatening light. Serial killers, such as Ted Bundy, have lured their victims into traps through artifice that includes fake smiling, banter, and distraction. People who score high on the psychopathy scale use charm and superficiality (e.g., false friendliness, compliments, empty promises, and fake smiles) to manipulate and seduce victims in order to control them to accomplish nefarious and murderous ends.

## Duping Delight

The act of lying is often accompanied by negative emotions such as guilt or fear of detection. Yet, many experience positive emotions instead: excitement or a thrill at having successfully lied to another, "pulling the wool over their eyes" without them being any the wiser. Such positive feelings are known as "duping delight," a phenomenon first described by detection scientist Paul Ekman. The used car salesman who smiles when he assures a customer that the dealership makes no money on the warranty he just talked the customer into, the so-called financial planner who disguises his glee at having convinced an 85-year-old widow that life insurance is a great investment for her, and the pretty, popular girl at school who snickers slyly after "helpfully" revealing to

the naïve, unattractive new student that the handsome captain of the football team wants to ask her to the homecoming dance—all these liars are experiencing duping delight.

It is important to draw the distinction between duping delight and pathological lying. Also known as *pseudologia fantastica*, pathological lying is a feature of some psychological disorders, manifesting as persistent lying in the absence of reason, necessity, or reward. Pathological liars commonly experience little emotion, and their lies tend to be very transparent. In contrast, duping delight is an emotion of pleasure that can occur among both normal and abnormal populations of liars.

### Who Experiences Duping Delight?

Everyone lies, sometimes to benefit others (such as the “white lie” that spares another’s feelings), and often for personal benefit (such as an employee calling in sick when he or she really wants to go shopping or attend a sporting event instead). Everyone may experience duping delight. However, psychological research indicates that certain kinds of people and personality types are more prone to lying and experiencing duping delight. Individuals who are socially expressive actors, are manipulative, or score high on Machiavellianism are more likely than others to experience duping delight. Some individuals routinely lie out of a need for stimulation, novelty, or excitement and to escape the boredom they experience. They are also more likely to experience duping delight, and the higher the stakes or greater the possible adverse consequences for them, the bigger the thrill. Such motives and reactions to lying are common among psychopaths, sociopaths, and individuals exhibiting psychopathic tendencies.

Persons who are socially adroit, braggarts, or boasters, who lie comfortably and believe they are good at it (e.g., con men, criminals, some salesmen, and sweetheart swindlers), and individuals with antisocial or narcissistic personality disorders tend to feel duping delight more than the rest of the population. Similarly, politicians, attorneys, highly successful business people, chief executive officers (CEOs), and those who enjoy control and power also tend to experience greater than average duping delight. They

may view those they deceive as intellectually or morally inferior, or they may believe themselves above the law; (e.g., the lying politician at the podium whose smirk betrays his contempt for the masses).

### When is Duping Delight Most Likely?

Duping delight can be experienced when anticipating the challenge of deceiving someone, or during the moment of lying when success is not yet certain. Delight can also be elicited when one is pleased and relieved after telling a lie, takes pride in the success of the lie, or feels contempt toward the target. However, the strength of these emotions can greatly vary at each stage and may be fleeting or may indefinitely persist as the deceiver celebrates his or her success.

Even the most mundane deceptions can produce duping delight, such as when a teenager might successfully get the car keys “to go to the library” when actually going to a movie. Yet, for some liars, duping delight is only felt when there is a great risk of loss, as is the case for people who carry out fraudulent financial schemes. Duping delight may also be enhanced by lying to targets who are particularly challenging (difficult to fool), dangerous (raising likely costs of detection), or even trusting. Sweetheart swindlers, for example, target the trusting. They use romance to gain access to their victims’ bank and credit card accounts, stealing from them and leading them to financial ruin while displaying fake feelings of love and devotion. When the partner grows suspicious, continuing the deception often proves even more enticing. Duping delight can also be particularly intense when there is an appreciative audience to admire one’s cleverness, to share in the entertainment of the deception, and with whom one can gloat.

### Duping Delight and the Risk of Detection

It may be challenging for the liar to successfully deceive while experiencing such pleasure in doing so, particularly if the pleasure is intense, or if the deception requires incompatible emotional displays, such as concern or sadness. The liar may be content to keep the fact of deception and his emotions to himself. However, for many would-be deceivers, the intensity of the duping delight or of the need to gloat may undermine the basic

goal of successful deception, motivating them to risk detection by leaking clues to the deceit or by daring others, even authorities, to interrogate or question them. The liar experiencing duping delight may feel such pride in the accomplishment of successfully deceiving others, particularly in a high-stakes circumstance, that they will reveal their deception, often to their lie's original target. If the deceivers survive such challenges, they may feel increased pride in their deceptive prowess, growing contempt for those they have duped, and greater interest in future deception.

However, many will fail. The duping delight may be difficult to contain and conceal, even if one does not need to gloat. The underlying delight may reveal itself as a brief flash of a smile at the sheer pleasure of getting away with the lie. A skillful deceiver may be able to successfully disguise the motive behind the smile as apparent sympathy, warmth, and sincerity toward the target of the lie. However, an inexperienced liar may be caught. Immature adolescents, who are unsophisticated liars, are frequently betrayed by their inability to conceal their delight.

Though research in duping delight originated in the behavioral sciences, other fields have provided additional context for furthering investigation into deception, the emotions that accompany it, and the detection of deception. Law enforcement, politics, and antiterrorism initiatives drove this

research in the late 20th century, and are likely to continue that trend well into the 21st century.

## Edwards, John

When political scandals hit the American airwaves, stereotypical images fill the minds of viewers and listeners as they piece together the transgressions allegedly committed. Much like a soap opera, citizens assume that there will be a twisted plot with likeable protagonists and infuriating heels. While most scandals fail to live up to the initial media hype, between 2007 and 2010, John Edwards—former Democratic Senator from North Carolina and John Kerry running mate during the 2004 presidential election—gave Americans everything they expected: A torts attorney turned politician running through hotel hallways, trying to shield himself from an alleged affair on his wife—who was both nationally known and fighting cancer. In the end, it took an even more bizarre twist when Edwards was proven to be the father of a child with his mistress. While unfortunate for Edwards (both personally and politically), his escapades showed a key attribute of political sex scandals in the United States: the act may not matter, but second-order transgressions do.

In late 2007, the *National Enquirer* reported that Edwards was having an affair with Rielle Hunter. She had been hired in 2006 to film a series of short videos related to life behind the scenes of his presidential campaign. Given the lack of credibility associated with the *Enquirer*,

very little was publicly said about the story. Instead, it was brushed aside as typical grocery store aisle smut. Most troubling, however, was that the initial article stated that a child had been produced from the alleged affair. At the time of the story, Andrew Young was an Edwards campaign insider. According to *ABC News*, shortly after the *Enquirer* story, Young was asked by his candidate to find a doctor to create fake DNA results (a la the plot line in *Primary Colors*), and then steal one of the baby's diapers to find out the actual paternity. Young accounting claimed to be the child's father for a period of time. Publicly, both Edwards and Hunter vehemently denied any accusations.

### Media Frenzy

When the initial *Enquirer* story ran, most commentators publicly claimed that it must be fake and just a product of the negative environment of contemporary campaigns. Determined to prove the truthfulness behind their allegations, the *Enquirer* sent reporters to the Beverly Hilton Hotel in July 2008 for a suspected meeting between Edwards, Hunter, and the child. While Edwards was not listed as a guest of the hotel, the *Enquirer* staff found him in a hallway after midnight and chased him into a restroom. He stayed there—away from the paparazzi—until he was ushered out by security while attempting to shield

John Edwards and his wife, Elizabeth (behind him, left) host a healthcare forum in Manchester, New Hampshire, February 3, 2007. His affair, which was well underway by this time, was clouded with deceit from beginning to end as Edwards consistently lied for months about numerous aspects of his relationship with Rielle Hunter—including fathering her child.

his face. This would become the image most directly associated with the demise of Edwards.

Later that summer, many media sources (considered far more reputable than the *Enquirer*) began discussing the allegations in reference to Edwards's political future. Pundits were questioning whether the suspected affair would cost Edwards the opportunity to be Barack Obama's running mate. As the story continued to gain traction, Edwards sat down with Bob Woodruff of ABC on August 7 and admitted to having an extended affair with the videographer. Edwards's admission to Woodruff read:

In 2006, I made a serious error in judgment and conducted myself in a way that was disloyal to my family and to my core beliefs. I recognized

my mistake and I told my wife that I had a liaison with another woman, and I asked for her forgiveness. Although I was honest in every painful detail with my family, I did not tell the public. When a supermarket tabloid told a version of the story, I used the fact that the story contained many falsities to deny it. But being 99 percent honest is no longer enough.

When this announcement was made, Edwards's wife was recovering from breast cancer and had a favorable long-term prognosis. Yet, the affair was still occurring when the Edwards' later issued a statement about the recurrence of her cancer and the new revelation that she was terminally ill.

At the time of the initial admission, John Edwards still denied being the father Hunter's child. Not long after the confession, Rielle Hunter's sister publicly pressured Edwards to submit a DNA sample to determine whether he was the child's father—not Young. Edwards, however, already knew the answer, and consequently resisted such calls until January 2010, when he publicly admitted that he was the father of the young girl and that the *Enquirer* had also been correct on this point in 2007. Elizabeth announced that she was leaving Edwards and was planning to file for divorce. Matters were only made worse when a sex tape including Edwards and Hunter became available on the Internet. In less than a year, Edwards's wife was dead and his political career was ruined.

### Lies and Politics

Andrew Young originally had claimed to be the father Hunter's child, but would later state in his book, *The Politician*, that he knew he could not be the father. While this revelation was expected, Young divulged other details that helped demonstrate Edwards's level of deceit. In 2006, Young recalled Hunter calling John Edwards's cell phone and talking in a sexually provocative manner. However, Elizabeth—not John—had picked up the call. According to Young, in response, John lied and confessed to only a one-night stand, going as far as to call Hunter in front of Elizabeth to end the affair. He did not share who his affair was with at the time, and he even called Hunter back immediately to apologize for his harsh tone during the alleged breakup. The bigger deceit—and

more emotionally scarring—involved Edwards's confessed desires to leave his wife, only to realize that he could not because of the vote share that he would lose given Elizabeth's high popularity with key voting groups.

The Edwards scandal was ripe with lies and deceit. As with most sex scandals involving American politicians, the sexual act is not the primary sin that leads to political pariah status. If Edwards had come clean after the *Enquirer* story, apologized (or apologized and divorced), and avoided the entire Beverly Hills Hilton fiasco, he could have survived. Instead, he continued to deceive his wife and the American public. He continued the affair, even after the initial disclosure. He never showed true appreciation of the pain he brought to so many. What made the Edwards story even more poignant, however, was that he was deceiving a woman who had helped launch and guide his political career—and who happened to be battling a cancer that would take her life. When he ran for vice president in 2006, some pundits discussed Edwards exuding a somewhat sleazy aura; his scandal did nothing to disprove them.

## Eisenhower, Dwight

Dwight David “Ike” Eisenhower achieved fame as the supreme commander of the Allied forces in

World War II (1943–44), and as the 34th president of the United States (1953–61). In both positions, he used deception to good effect. Early in his life, his dishonesty hardly ranged beyond a love of poker and bridge, but deceptiveness came to be a decisive tool to winning World War II and a way of changing the world when he presided over the Central Intelligence Agency's (CIA) formative years. However, deception also nearly proved to be his downfall when mistakes made in North Africa became political and when the CIA's regime-building changes failed in Indonesia.

### Eisenhower and World War II

Eisenhower was introduced to military deception by Prime Minister Winston Churchill. Meeting for the first time in 1942, the British leader briefed Eisenhower on many things, including the British network of “turned” German spies, the Manhattan Project, and Ultra. Keeping the secret of Ultra—that the Allies could read the Germans' secret code encryptions—was pivotal to the Allied victory.

Eisenhower was quick to recognize the usefulness of military deception, despite the U.S. Army's limited experience with codes and intelligence. His insistence on managing the nominally civilian Operation of Strategic Services (OSS), the forerunner to the CIA, as long as it was operating in his theater of war quickly taught him the riskier side of deception when the OSS tried to encourage, in vain, a French resistance in North Africa. Embarrassments caused by the OSS's lackluster work in finding a French leader and the agency's possible participation in an assassination nearly caused the end of Eisenhower's career early in the North African campaign.

Surviving the embarrassments caused by the OSS, Eisenhower continued to learn the art of deception. After the nearly successful German counterattack at Kasserine Pass, he realized that the best intelligence could not come from only one source. He left Africa sensitive to the weaknesses of both spying and signals intelligence, such as Ultra.

When prisoners revealed that the Nazis were able to read low-level Allied codes, Eisenhower recognized the counterintelligence value, telling General George S. Patton that it was better not to change the codes as long as information

transmitted was not too sensitive. Such deception encouraged German confidence in the accuracy of the decoded signals, a useful trust if Eisenhower ever needed to provide misdirection as to where an attack would come.

### Operation Fortitude

Nowhere was such misdirection more successful than in Operation Fortitude, which convinced the Germans that Eisenhower was in charge of a much larger landing force than he actually was, and that the force was aimed somewhere other than Normandy. Fortitude was possibly the greatest success of the war, and was certainly Eisenhower's greatest success with deception. As the supreme commander, he was in charge of veterans employed to create the radio chatter expected from a fake army, stagehands building fake landing equipment and bases, overseeing the information relayed through double agents, and multiple layers of security.

After his experiences in north Africa, Eisenhower was well aware that the Germans expected Patton to be in charge of the landings, and Fortitude provided confirmation of this through the German spies that the British had turned. Remaining personally involved in the multilayered deceptions that made up Fortitude, Eisenhower went so far as to reuse a strategy that he had learned earlier in the war of making the press feel like a part of each unit; he believed this sense of participation in the war effort made the press less likely to leak important secrets. He was more suspicious of civilians, though, and after a difficult fight, he managed to convince Churchill to have civilians moved away from staging areas.

Almost as soon as Eisenhower had gotten his invasion force underway, the German high command knew that a landing force was en route to Normandy. Operation Fortitude had issued the information through double agents in order to maintain German trust in their sources. This tactic aimed to keep German attention focused elsewhere when Fortitude continued to run in the months after the Normandy landing. The deception convinced the Germans that Normandy was but a small diversion, and that a much larger force was still coming to a location miles away. This was crucial for Eisenhower's success, for it kept strategic forces out of the fight long enough

for the Allies to establish their beachhead and hold it until their manufacturing advantage and greater material resources could simply overwhelm the besieged German army. After the stellar success at Normandy that was assured by Fortitude, Eisenhower's task was relatively straightforward.

### President Eisenhower

Eisenhower's use of deception as president is more debatable. As a politician, he is known for his carefully cultured image of being direct, but behind the scenes, he probably was more adept than he revealed. Even when fighting U.S. Senator Joseph McCarthy's power, the president was forthright. Domestically, Eisenhower's use of deception was simple: For example, his bumbling style and apparent lack of knowledge in press conferences was almost certainly feigned to keep from making mistakes or to avoid delicate subjects on which he did not want to comment. In foreign affairs, however, deception was almost as invaluable as it had been during World War II.

With Allen Dulles heading the CIA, covert operations significantly expanded in the Eisenhower years. At one extreme, the president either authorized or allowed government-toppling operations in Iran, Guatemala, and Indonesia. Operation Ajax, the CIA's first attempt at changing other governments, was aimed at Iran and involved no less than the nephew of former president Franklin D. Roosevelt, though Eisenhower's deputies were careful to keep from introducing him to the president.

Always aware of the political ramifications of being involved with intelligence operations if something were to go wrong, Eisenhower's administration was careful to insulate the president. Select committees reviewed and assessed covert operations at a distance from Eisenhower. Other operations were less successful, and records indicate that Eisenhower was cautious in approving such deceptive enterprises before he felt extremely confident that they would succeed. This caution is sometimes cited as the cause of the Bay of Pigs disaster. Eisenhower had actually approved of raising and training Cuban exiles as a guerrilla force to retake the island from Fidel Castro, but the president appears to have held the force back because he doubted its effectiveness.

Eisenhower's successor, President John F. Kennedy, inherited this force and operation shortly after taking office, approving it with famously bad results.

Eisenhower's personal involvement in his administration's deceptive efforts is well illustrated by his control over every U-2 spy plane's flight plan. The aircraft was instrumental in providing Eisenhower with intelligence that made him comfortable presenting his arms limitations and open skies proposals, including the intelligence necessary to debunk the 1960 campaign claims from then-Senator Kennedy that there was a missile gap between the United States and the Soviet Union. Eisenhower's commitment to the U-2 deception, however, meant that he chose not to reveal the truth—despite Vice President Richard Nixon's conviction that revealing such knowledge could be instrumental in preventing a Democrat from winning the presidency.

While parts of Eisenhower's legacy involving deception are not always clear, the historical cases that are more certain indicate that he was generally successful in using deception. As both a president and a general, his uses of deception tended to achieve his desired ends, whether it was creating fake invading forces or displacing hostile regimes.

## Ekman, Paul

Paul Ekman is one of the foremost researchers in nonverbal communication, intrapersonal deception, and lie detection. After completing his undergraduate studies at the University of Chicago and New York University, he earned a doctorate in clinical psychology from Adelphi College in 1958. He was a professor of psychology at the University of California, San Francisco, retiring from this position in 2004. Ekman has published over 100 articles, chapters, and books on topics including facial expression and deception.

His research has been funded by the National Institute of Mental Health for over four decades, and he has been featured on major television networks and in the popular press. One of his most notable achievements is his work in the area of lie detection. Through years of research, Ekman has developed techniques for identifying lies, and has taught these techniques to an array of professionals.

### Definitions of Lying and Deception

In order to appreciate Ekman's work, it is important to review his definitions of lying and deception. A clear definition of lying is important because people are expected to exhibit behavioral clues of deception only if they realize that they are lying. Persons who believe that they are telling the truth are unlikely to convey signs of lying. According to Ekman, lies have two characteristics that make them unique from other kinds of deception. First, lying is done with the intention to be misleading. This component distinguishes lies from false statements that are believed to be true by the liar. Second, lying occurs in situations in which the false statement is not expected. This distinguishes lies from storytelling and acting, in which the observer anticipates words and actions to be feigned for entertainment value.

Ekman has described several acts of deceit that constitute lying, such as making false claims when the truth is expected, concealing information that is expected to be disclosed, and telling half-truths. Often, lies are told in the hope of avoiding or escaping unpleasant events. People have lied to dodge punishment, physical harm, and threats to friends and family, and to escape uncomfortable emotions. People may also tell a

lie to protect their privacy. Lies are also used to acquire pleasant things. For example, people may lie to gain money and other profits, enhance their social status, and increase their power and influence over others.

Ekman notes that lies may be exposed for a variety of reasons, including the liar's nonverbal expressions. This type of failed lie tends to occur because the person has not prepared well for the lie, or because emotional expressions give the lie away. If the liar is not fully prepared and is caught off-guard, he or she may exhibit several behavioral reactions, such as changing eye contact, speaking less clearly, and pausing to think as he or she composes the lie. In other instances, the liar may forget the details of the lie and produce contradictory statements.

### Microexpressions and Emotions

Liars may also give a lie away by failing to fully conceal emotions. Many emotions are accompanied by automatic facial expressions and other gestures that may be difficult to control. These expressions—known as microexpressions—occur very quickly and without conscious control of the liar, making them difficult for the liar to perceive and for other people to detect. Certain microexpressions are linked to certain emotions. For example, a furrowed forehead, squinted eyes, compressed or quivering lips, quivering chin, and twitching corners of the mouth are microexpressions of nervousness. It is possible that someone who is lying may feel nervous and thus emit these microexpressions.

Ekman's work on microexpressions has led to the development of two coding systems: FACS (Facial Action Coding System) and F.A.C.E. (Facial Expression, Awareness, Compassion, Emotions). FACS is a self-instructional system designed to train people to read all human facial expressions. The training takes a minimum of approximately 100 hours to complete. F.A.C.E. is an instructional system designed to teach people how to read emotions from different facial expressions. It is composed of two parts: SETT (subtle expression training tool), and METT (micro expression training tool). The SETT and METT teach people how to detect microexpressions and the emotions that are associated with each type of microexpression.

Ekman has also found that some people are more accurate at detecting deception than others, indicating that some people may possess traits that allow them to detect lies. Ekman's work has shown that Secret Service agents are very accurate at detecting lies and concealed emotions; however, many other groups believed to be very accurate at lie detection (e.g., police officers and agents of the Federal Bureau of Investigation, Drug Enforcement Administration, and Central Intelligence Agency ) are actually not.

Despite the popularity of Ekman's work, his research has been subject to significant scientific scrutiny. Notably, the screening passengers by observation technique (SPOT) was designed to identify terrorist threats to air travelers, but was not scientifically validated before it was used in airport security screenings. Some researchers report difficulty replicating his results. At times, he has also avoided the normal scientific peer-review process in an effort to prevent his lie detection techniques from being discovered and abused.

Dr. Ekman and his microexpression work has been highly influential in the area of lie detection. His work was also the inspiration for the FOX Network television show *Lie to Me*, for which Ekman was a scientific consultant.

## Electroencephalography

Modern neuroscience techniques provide new leads for experts in the detection of deception. These techniques rely on internal data from inside the brain, rather than external data from speech or nonverbal behaviors. Modern deception detection techniques measure patterns of neurological activity, rather than the contents of verbal reports or facial expressions. One neuroscientific advancement—electroencephalography (EEG)—has been particularly useful in uncovering what occurs “inside” someone’s mind when he or she is lying and has significantly advanced the accuracy of lie detection.

### Defining Electroencephalography

EEG is a noninvasive brain-imaging technique that measures electrical activity. Researchers place sensors across different locations on a person’s scalp and record patterns of electrical activity. Electrical activity can be described by the place it occurs on the scalp, the time at which it occurs, its formation, and its voltage. Components of electrical activity described along these lines are referred to as event-related potentials (ERPs). For instance, the P300 component occurs 300 milliseconds (ms) after a stimulus appears with positive voltage. ERPs are associated with psychological processes, such as people’s ability to pay attention to objects or remember presented stimuli. ERPs are a measurement of neurological activity that can be used to suggest which psychological processes occur in response to stimuli.

### Use of the Procedure as Lie Detection

In the early 1990s, researchers began asking whether techniques of neuroscience, and EEG in particular, could be used to detect deception. Dr. Lawrence Farwell and his colleagues created one of the first paradigms that used neurological measurement to detect lies. First, they modeled their test after the oddball paradigm. In the

oddball paradigm, participants recognize a target word when it appears on a computer screen among other irrelevant distracter words that are presented in quick succession. Farwell adapted the oddball paradigm to create a test that could detect whether people were aware of “guilty knowledge,” or information considered significant to a particular scenario or event.

In the original guilty knowledge test, participants read one of two hypothetical scenarios and memorize specific details about it. For instance, participants might remember the clothing worn by people in the scenario. Participants next perform an oddball paradigm task. They identify when a target word that is not related to details of the scenario appears in a sequential display of other distracting words. Importantly, among the distracters are words related to details of the hypothetical scenario previously memorized. For instance, participants may see the word *coat*—a word considered relevant to the memorization task.

Farwell suggested that EEG could measure ERP components evoked in response to targets and relevant and irrelevant distracters during the guilty knowledge test. A P300 component appears when participants see a target word or relevant distracters that are considered guilty knowledge. Importantly, the P300 is not evoked for irrelevant distracter words. The presence of P300 components indicates that both the target words and guilty knowledge words receive heightened attentional processing. From these data, Farwell suggested that the presence of a P300 component could identify whether a person had knowledge of an event, like a crime scene, that he or she might not choose to verbally share. For instance, if a suspect accused of a murder perpetrated by a knife is given the guilty knowledge test, the word *knife* may evoke the P300. Farwell suggested that the P300 could indicate whether a person witnessed and remembered details of a crime, regardless of his or her attempts to claim ignorance.

While Farwell and colleagues originally tested this paradigm in the lab, he also tested the viability of EEG as a lie detector for use in court proceedings and legal decisions with the Federal Bureau of Investigation (FBI). The FBI concluded that when the P300 is combined with another negative voltage component to create a multifaceted electroencephalographic response (MERMER), EEG can

predict whether someone knows facts about an event with 99.9 percent accuracy. By combining multiple ERP components, the EEG has become increasingly more reliable in real-world settings.

### Use of the Procedure in Court

The EEG is increasingly used as evidence in court. Farwell's guilty knowledge test was admitted as evidence in the controversial murder trial of Terry Harrington, who was convicted of the crime in 1978, and was sentenced to life in prison without possibility of parole. Harrington's performance during a guilty knowledge test suggested that he did not commit the murder for which he was convicted. In 1997, Harrington petitioned the Iowa District Court for Pottawattamie County for a new trial. However, the court decided that the evidence was not substantive enough to overturn Harrington's original conviction. Harrington appealed this decision and in 2001, the Iowa Supreme Court reversed his conviction and ordered a new trial. The Supreme Court maintained that Harrington had been denied access to evidence that could have helped his defense.

### Conclusion

EEG as a lie detection device is limited. One primary limitation is that the guilty knowledge test only detects whether an individual has information about an event or person, but cannot distinguish among the sources of that information. For instance, someone who committed a murder or someone who merely witnessed the murder may have the same knowledge. However, the ERP test results would likely indicate that both individuals had guilty knowledge.

EEG-based lie detection requires further testing. EEG is one of the first neuroscience technologies used to detect lies, and it has sparked interest in adapting other neuroscientific techniques for lie detection. As neuroscience technology continues to advance, the ability to look into someone's mind to detect lies may not be as far out of reach as was once thought.

## Emotions

The act of lying and emotion are intertwined. Lying is typically accompanied by feelings of negative affect, such as guilt, shame, and fear, as well as feelings of positive affect, such as excitement. Furthermore, individuals' reasons for lying are typically rooted in emotions. That is, lies are often told to protect the liar's emotions or to protect the emotions of another person. Furthermore, lying is often used as a means to mask one's true feelings.

### Emotions Experienced When Lying

According to Paul Ekman, who is well known for his separate lines of research on emotions and on lying, emotions play a role in lying in one of two ways. First, individuals sometimes lie to conceal their true emotions. However, lying to prevent another person from having his or her feelings hurt is also common, leading other researchers to distinguish two main types of lying: self-centered lies and other-oriented lies.

Self-centered lies are told to protect or bolster the liar's status. For example, in the context of emotions, individuals lie to avoid feelings of embarrassment, to regulate their feelings, to avoid having their feelings hurt, or to avoid feelings of negative affect, such as worry or conflict.

An individual may also lie about his or her current emotional state because he or she wishes to maintain a certain level of privacy. Other-oriented lies, in contrast, serve to protect or enhance other people. For instance, individuals will lie to protect another individual's feelings or to prevent feelings of negative affect, such as worry or conflict. Telling other-oriented lies (also known as white lies) is usually required to enhance and maintain close relationships.

Second, Ekman contends that regardless of the emotional content of the lie, liars generally experience specific emotions if their lie has high rather than low stakes. Stakes are higher if the liar fears getting caught in the lie; the liar possesses similar values to the individual that he or she is deceiving, causing the liar to feel guilty; or others bear witness to the liar deceiving another person, which can yield feelings of excitement. Inadvertent emotional cues that could reveal the lie (also known as leakage) are more likely to be displayed when the stakes are high, rather than low, because the liar will usually feel more intense emotions. In these situations, such nonverbal cues are likely to be more noticeable because the liar typically experiences negative affect, which in turn yields withdrawal behaviors. For example, if feeling guilty or ashamed, liars may be less likely to look the listener directly in the eyes. Furthermore, both fear and excitement can lead to higher levels of arousal, which can increase speech errors, stutters, hesitations, and voice pitch. Additionally, when a liar is excited, he or she is likely to display an increase in body movements and smiling.

### Stress and Lying

Lying is also a stress-inducing behavior because of emotions, specifically feelings of guilt about being dishonest and feelings of fear about being detected. When a liar feels guilty and the amount of guilt experienced is high, he or she will have difficulty concealing cues that he or she is lying. Moreover, feelings of guilt can often motivate an individual to confess in order to alleviate the negative emotion. Greater fear of being detected occurs when the recipient is perceived to be skilled at lie detection, rather than perceived as gullible. In contrast, greater excitement likely accompanies successful deception of a skilled versus unskilled lie detector. This feeling of excitement has been

termed “duping delight,” and it includes feelings of excitement in either the anticipation of telling the lie or the act of lying itself, followed by a feeling of pleasure, a sense of relief, pride for successful deception, and even disdain toward the recipient. When duping delight is extreme, behavioral cues may become apparent to others, indicating that deception is occurring.

### Nonverbal Displays

Although lying is typically thought of as occurring through verbal means (i.e., telling a direct lie to another individual), nonverbal lying can also occur. For instance, omission is considered to be a form of deception, even though the individual is not telling a falsehood per se, and individuals often feel compelled to lie about or mask their emotional state. They may verbally do so (telling another person that they are “fine” when they are not), or they may do so by controlling their nonverbal expressions (pretending to be happy when upset).

The latter can be labeled “masking” because the individual does not display any nonverbal

*When a liar feels a high level of guilt, he will have difficulty concealing stress cues that he is lying, such as increased body movements and a high voice. Feelings of guilt can often motivate an individual to confess in order to alleviate the negative emotion.*

cues related to the specific emotion, but instead displays the opposite emotion.

In certain situations, masking of either negative or positive emotions would be the social norm. For instance, in the workplace, the expression of negative emotions is less acceptable, and individuals are expected to mask negative emotions, particularly around their superiors. Controlling the display of specific emotions within the context of the workplace has been termed “emotional labor,” and although it is socially dictated, masking or engaging in emotional labor is related to poorer physical and psychological health.

In other situations, social rules dictate the masking of positive emotions. For example, when one is successful in a certain task or in a certain domain, but a close other is not, one often masks or at least dampens the expression of happiness out of consideration of the other person’s feelings.

Ultimately, emotions are a core component of many lies and the lying experience. The act of lying induces strong emotions in the liar, such as guilt, shame, and fear. Lying, however, can also be an exhilarating experience, leading to feelings of excitement and positive affect. In terms of the content of lies, many lies are emotion-related—such as lies that are told to protect the liar’s feelings or the feelings of another individual. Even when the lie is not emotional, a liar can experience heightened emotions when the stakes are high. Finally, nonverbal behaviors are often employed by individuals to mask their true emotions, and such deception is actually encouraged and expected in many social situations.

## Enron

In less than a year, Enron went from one of the most innovative companies in the world to infamy for corporate scandal, deceit, and greed. Formed in 1985 by the merger of Houston Natural Gas and Internorth, Enron eventually became the largest seller of natural gas in North America by 1992. Part of the reason that Enron rose so quickly were the actions of its founder and chief executive officer (CEO), Kenneth Lay, who helped initiate the selling of electricity at market prices. Soon after, Congress deregulated the sale of natural gas, giving Enron the opportunity to sell energy at higher prices than ever before. Enron’s revenue and stock continued to climb throughout the 1990s because of the strategic maneuvers of its leaders. By the end of December 2000, Enron’s stock was priced at \$83.13, and it was named the most innovative large company in America in *Fortune* magazine’s “Most Admired Companies” survey. There was reason to be hopeful about the future of Enron.

Instead, the large and growing company was about to experience a scandal and downfall that would lead to bankruptcy, the loss of thousands of jobs, and the conviction of several Enron executives.

The scandal centered on the lack of transparency in Enron's financial statements. Because of the fairly complex structure of Enron, a near cult-like punitive corporate culture with unrealistically high expectations and a myriad of unethical practices, there was pressure to misrepresent earnings and portray favorable performance for the company. This pressure to always keep income up and liabilities off the books eventually led to bankruptcy. It would later surface that the majority of actions that led to Enron's downfall were perpetrated by Kenneth Lay, Jeffrey Skilling, Andrew Fastow, and a few other high-level executives.

### Early Years to Bankruptcy

In its early years, the newly merged Enron faced a tremendous amount of debt and teetered on the verge of bankruptcy. The CEO at that time, Richard Kinder, emphasized accuracy in cash management, and would hold weekly meetings with business unit leaders to challenge their reported numbers. While he pushed for excellence, he did not accept unrealistic goals and would question overly optimistic proposals. Business was important, but he respected his employees and was described as people-oriented.

The appointment of Jeffrey Skilling as chief operating officer (COO) and later CEO marked the beginning of a new culture. Deregulation allowed Enron to break from the old system, be innovative, and become a leader in the industry. Executives seized upon this opportunity and encouraged aggressiveness and independence. Enron's contracts became increasingly diverse and complex as the company started to see rapid growth. Through the use of specific accounting maneuvers, profits from long-term deals were immediately recorded, and short-term results were emphasized.

In order to keep growing and keep investors excited, Enron began to borrow money to invest in new projects. Because this would make Enron's earnings look less impressive, the company created partnerships to keep the resulting debt off the books. Enron was able to hide hundreds of millions of dollars in debt through this practice, which made the company appear more profitable than it was. Enron also attracted big investors with promises of secret information about the company that was not made available to the public or government. Such secrecy violates laws in

place to protect all investors by ensuring that they have full access to accurate information about publicly traded companies.

There were signs of trouble for Enron as early as March 2001, when Bethany McLean, a *Fortune* magazine writer, published an article questioning how the company made its money. In August of that year, an employee sent an anonymous letter to the CEO at the time, Kenneth Lay, describing her worries over Enron's accounting practices. Lay sent e-mails to employees expressing his optimism that Enron's stock would rise. However, he sold his stock in the company. In October of that year, Enron announced a loss of \$638 million from a failed Internet investment, and the Securities and Exchange Commission announced that Enron was under investigation. Enron later announced that it had overstated earnings by \$586 million and that it owed over \$6 billion in debt. Unable to pay back the money owed to creditors, Enron filed for Chapter 11 bankruptcy.

### Corporate Culture of Deceit

The first question that many people were asking as the scandal began to unfold was: How could intelligent, educated individuals either directly falsify financial reports or know that this behavior was occurring and turn a blind eye? There are several factors that led to the culture of deceit that Enron embraced during its lifespan. One such factor is the expectation that Enron felt to keep stock prices on the rise and please investors. Enron executives felt driven to sustain the explosive growth that the company experienced in the late 1990s, when they knew that it was not possible. However, reporting negative earnings would have been a warning sign to investors, which could have driven the stock price down, and credit agencies would be forced to downgrade the company's credit rating. Trading partners might then lose faith in Enron and stop trading with the company. The company's very ability to generate cash flow would be greatly compromised.

Executives were willing to bend the rules and rationalize their behavior in order to avoid this scenario at all costs. The leadership style of several of the executives at the time, especially Jeffrey Skilling, also helped pave the road for a pattern of lying and deceit. For example, Skilling exerted control over almost all major operations

of the company, including accounting. Taking a rather Machiavellian approach to leading Enron, it seems Skilling was willing to do whatever was necessary to meet expectations and keep the reputation of the company on the rise. Everyone under him learned that this was the way that Enron conducted business.

Coinciding with the entrance of Skilling, Enron's culture saw a dramatic shift; however, the fall of Enron was due to the actions (and inactions) of multiple individuals. Under Skilling, an extreme performance-driven culture formed that held wealth and status in high prestige and tolerated rule breaking and deviant behavior, as long as the numbers were up. Employees, realizing that the risk was termination and the reward was a very large paycheck, learned to compete fiercely with each other while ignoring and even breaking ethical and legal boundaries. This created an environment in which employees did not feel comfortable or safe to question senior management. Once employees align with a corporate culture and become convinced of the wisdom of its leaders, they can begin to lose their sense of individual identity and rationalize attitudes and behaviors that they would have previously deplored.

Executives and lower-level employees had a significant amount to gain from participating in this continuous deception. As a leader, Skilling placed significant importance on rewards and status. On bonus day, upscale car dealers were set up around the Enron headquarters, showcasing the newest and most expensive car models. The culture that Skilling was building was difficult to avoid, and many employees were drawn to promises of increased monetary rewards and benefits. For executives, if profits and stock options significantly increased, they could then buy stock more quickly. For employees, Skilling rewarded traders who met their earnings targets with very large paychecks. These incentives were difficult to resist for many employees, which drove them to engage in actions that, in a less high-stakes setting, may have been very different. These actions, the scandal, and the resulting bankruptcy meant that corporate culture, influence, and executive behaviors had reason to be heavily scrutinized in the future.

The scandal at Enron affected more people than just those inside and invested in the company. The events led to the voluntary licensure

surrender of Arthur Andersen, once one of the "Big Five" accounting firms. The firm was found guilty of criminal charges relating to its handling of the Enron account. Even though the criminal charges were later overturned, the company's reputation would never fully recover from its close ties to Enron. Along with the other highly publicized corporate scandals at Tyco and WorldCom, the events that unfolded at Enron also led to the creation of the Sarbanes-Oxley Act of 2002, a federal law that set enhanced standards for all U.S. public company boards, management, and public accounting firms. The act contains 11 titles, ranging from additional board responsibilities to criminal penalties.

## Conclusion

Ultimately, what individuals are encouraged to learn from the Enron scandal is that organizations receive and perpetuate the behavior that they reward. Many Enron employees witnessed unethical behavior and did nothing, or began participating in it themselves out of the perceived lack of risk and promise of payout. This happened because the culture not only allowed it to happen, but also rewarded it. When organizations reward their employees for honesty, appropriate whistleblowing, and engaging in ethical behaviors, examples of stronger corporate cultures are expected to flourish in the future.

## Equivocation

The term *equivocation* is used in two different senses: as a logical fallacy and as communicative strategy.

The logical fallacy of equivocation occurs when a term is used with two or more different meanings within the same argument. For example, consider the following argument: A plane is a carpenter's tool, and the Boeing 737 is a plane, hence the Boeing 737 is a carpenter's tool. Here, the word *plane* in the first part of the sentence refers to a tool used by carpenters to shape wood, and in the second part of the sentence it means an airplane.

The other sense in which the term *equivocation* is used is as a communication strategy in which the speaker deliberately says something ambiguous, with two interpretations, and believes only one of them to be true, but wants the hearer to infer the false one. A frequently cited example is of an advertisement that says: "No heat costs less than oil heat." Here, one interpretation is that not using any heating costs less than heating using oil, and the other is that oil heating costs less than any other type of heating. The first interpretation is probably the one that the advertisers believed to be true, and the second is what they hoped the readers would infer.

### Equivocation and Psychological Conflicts

Research in interpersonal communication shows that equivocation results from psychological conflicts that result when a choice must be made between two undesirable alternatives in a conversational situation. They do not result from generally unpleasant situations, or conflicts that result when a choice must be made between two desirable alternatives.

The situation described in the heating oil example demonstrates a conflict in choosing between two undesirable alternatives. The advertisers would neither like to say that not using any heating costs less than heating using oil because that

would be against their interests, nor would they like to say that oil heating costs less than any other type of heating because that might not be entirely true. Both alternatives are undesirable, thus invoking the need to equivocate. The necessary condition for equivocation is a situation in which direct and clear responses are negative and need to be avoided.

During such conflicts, equivocations allow speakers to avoid being committed to any one alternative. In that sense, they allow speakers to plan ahead by reasoning and provide them with "plausible deniability" should it be needed later. They also help speakers assuage their sense of guilt because speakers can reassure themselves that there is some truth in what they are saying, at least at the utterance level.

### Strategic Use of Equivocation

The high rate at which people prefer equivocations when choosing between two undesirable alternatives indicates that they are strategically used by speakers to mislead the hearer, and cannot simply be explained by communicative errors like the speaker being honestly mistaken about the hearer's possible interpretation of his utterance. Equivocations are often used as a strategy by politicians. One reason for this is that politicians have to deal with a variety of audiences, and disagreements with even a fraction of them can often have very high costs. *Yes Minister*, the popular British Broadcasting Corporation (BBC) comedy of the 1980s, has many examples of equivocations in such situations.

Consider another situation in which a professor is considering hiring Jones, a former student of a colleague, Smith, from a different institution. The professor asks Smith whether he would recommend Jones. Smith wants the professor to hire Jones because even though Jones is not very bright, Smith is very fond of him and knows that Jones desperately needs a job. On the other hand, Smith does not want to directly respond, because if he says yes, that would be a real commitment, and Smith does not want to damage his reputation by recommending a bad student. Smith says, "I can't recommend Jones highly enough." This could have two interpretations: "Jones is so good that there is no limit to how highly I can recommend him," or something more like

“Jones is not good enough for me to recommend him sufficiently highly to impress you.” The burden of getting to the truth is placed on the hearer, and in principle, it is possible for him to do that, but the speaker intentionally refrains from helping him.

Surveys show that in situations in which the unambiguous truthful response is a message that disagrees with the hearer, speakers are perceived to be more agreeable if they use equivocations than if they use a direct message. Several empirical studies have demonstrated that ambiguous messages are often distorted by the hearer to match his or her attitude. Equivocation tends to suppress incompatible meanings, and speakers are more positively judged when they equivocate than they would be judged if they delivered a clearly stated disagreeable message. A surprising finding is that this often holds true, even in cases in which the hearer is able to perceive the ambiguity of the message.

As opposed to those using direct language, equivocating speakers are given a high score on qualities like good-bad, reliable-unreliable, and just-unjust, which are quantified into a metric called “character score.” One reason for this is that unlike directly stating disagreements, equivocation prevents an immediate loss in appraisal. This is so because, at best, hearers interpret it favorably and, at worst, it provides them with the benefit of doubt. An example would be a case in which a woman asks her friend how she looks after getting ready for a party. The friend does not like her outfit, which is very bright, but he doesn’t want to say that, nor does he want to lie. So, he equivocates by saying, “You look striking,” which could be interpreted as either positive or negative.

There isn’t a consensus on whether equivocations are perceived as true or false. While a few studies place them midway between lies and truthful statements, others regard them in the same way as truthful statements, but unclear and ambiguous—thus deception by telling the truth. They are generated by manipulating the manner in which the speaker chooses to state his intentions, that is, by saying something that is perceived to be, at worst, ambiguous while causing the hearer to infer something false. Because of the generally positive perception of equivocation, it is

considered to be a safer deception strategy than other forms of dishonesty.

## Espionage and Counterespionage

Often referred to as the world’s second-oldest profession, espionage is at least as old as the Bible, wherein the Book of Joshua refers to spies

sent by Joshua into Canaan before he led the Jewish people across the River Jordan. Espionage and counterespionage are loaded with lies and deception; arguably, they are their stock in trade. However, in addition to the types of lies and deceptions commonly portrayed in cloak-and-dagger novels and films, in which spies engage in games of cat and mouse, lying and deception are part of every stage of a broader game of espionage and counterespionage that are integrated into a process formally known as the intelligence cycle. Furthermore, lying and deception occur even within the ranks of well-meaning, patriotic members of the intelligence community and policymakers, or in tasks as seemingly benign as collaborations on routine intelligence reports.

### Requirements

As a policy-driven enterprise, requirements—the initial phase of the intelligence cycle—originate with policymakers who set the overarching national intelligence-gathering agenda. This includes identifying the intentions and deceptions of other actors (e.g., Does country X have chemical weapons, though it claims it does not? What banks are laundering money for terrorism financiers?). It also includes the need to guard one's intentions and deceptions. Guards against hostile agencies' human intelligence collection activities (versus, for example, satellite intelligence collections) are known as counterespionage. However, counterespionage is a subset of a much larger effort to guard one's intentions and deceptions, formally known as counterintelligence (CI).

### Counterintelligence

The requirement for counterintelligence is composed of actions to guard against threats from outside the intelligence community (agents from hostile organizations) and from inside it (moles). The CI mission is to conceal state secrets, including their sources and the means by which they were collected. In the process, CI officers must overcome the tendency to trust others—including those within their organizations who have passed security clearance screenings—to assume that virtually anyone can be a spy.

There are two safeguards present in all U.S. intelligence agencies to protect against CI. The

first is the process of personnel screening. This includes background checks of job applicants and current employees to weed out those whose allegiances are deemed too risky to be entrusted with state secrets. Often, these background checks involve questioning personnel with the use of a polygraph. However, the polygraph—which measures physiological changes—can be manipulated or defeated by interviewees. Aldrich Ames, among the most famous of Central Intelligence Agency (CIA) moles, passed several polygraph interviews during his tenure, during which he fed voluminous amounts of intelligence to his Soviet handlers.

The second CI safeguard is the classification system whereby sensitive information is labeled (e.g., confidential, secret, or top secret) and securely compartmented according to the risks it poses, were it to be compromised. Even within a given classification tier, materials are further compartmentalized (e.g., in sensitive compartmented information facilities, or SCIFs), whereby access to information is granted on a need-to-know basis. The goal of this system is to reduce individuals' access to information, hence reducing the damage that could be done by any given source of information leakage. Critics of this system point out that it has been deceptively used to conceal from the public illegal activities and professional mistakes made by government personnel.

### Covert Action

Covert actions are actions that nations take to forward their policy-driven agendas in ways that allow nations to plausibly deny responsibility for their activities. These actions, aimed at a nation's adversaries, include such activities as paramilitary operations, planting false news reports, and spreading false rumors. If the deception is discovered by the adversary, it can result in dire military or diplomatic repercussions. At a minimum, the intelligence gains of a compromised covert action are limited insofar as the adversary is made aware of the breach in its system and may take steps to shore up its counterintelligence around such vulnerabilities.

### Collection

The second phase of the intelligence cycle—collection—is the phase most commonly associated with

*During a night raid on July 11, 2003, a soldier from the 101st Airborne Division enters a building of a former hostile Iraqi general who has been identified through intelligence gathering to be the main organizer of attacks against American forces, causing multiple casualties throughout Mosul, Iraq, during Operation Iraqi Freedom. The raid was triggered by information gathered during the intelligence cycle, which includes covert action, collection, analysis, dissemination, and feedback.*

espionage. In this phase, government agents—formally known as “case officers”—assume one of two kinds of deceptive cover stories to explain their presence in a foreign nation. “Official cover” is a governmental posting, typically at an embassy. However, case officers maintaining this type of cover are likely to be suspected of connections to their government’s intelligence services. Therefore, there is a need for some case officers to have “non-official cover” (NOC, pronounced “knock”), whereby they masquerade in less suspicious occupations (though international law prohibits cover as clergy or members of the Peace Corps). One of the ideal NOCs is that of a journalist: someone who, by trade, has reasons for foreign travel and to meet with a wide range of people.

Once under cover, case officers begin recruiting and handling a network of spies—formally known as “agents”—during which time they remain sensitive to the possibility that their spies are deceiving them. An agent could be a “dangle”: bait held

out by a hostile intelligence service hoping to produce a double agent for itself. Alternatively, agents might fabricate or exaggerate the information that they disclose to case officers in the hope of continuing to profit (financially or emotionally) from their associations with them. Consequently, case officers perpetually question agents’ motives, how agents have access to information, and the accuracy of that information. Ultimately, case officers must balance risk to intelligence security with the risk of lost intelligence opportunities.

### **Analysis**

Information from the collection phase is not considered intelligence until it has been groomed for use, which often includes translating, decoding, or reviewing it in context with other information, as part of the third phase of the intelligence cycle—analysis. In rendering intelligence assessments, the United States uses a competitive analysis system, whereby different intelligence agencies, or

different teams within an agency, derive independent assessments that are later reconciled. Analysts' careers, if not their egos, depend to some degree both on "being right" and being noticed by their superiors for being right. Consequently, competing analytical groups will occasionally deceive one another by including false or weak analyses (so-called false hostages) in their initial draft reports: hostages that they concede to the opposing team in exchange for inclusion of their pet points in the final intelligence report.

Furthermore, in an effort to gain attention, analysts occasionally deceive policymakers by bending the truth or exaggerating the importance of their assessments. In the extreme, analysts warp their assessments to tell policymakers what they think they want to hear (known as "politicization"). Additionally, policymakers occasionally take information deliberately out of context from otherwise sound intelligence reports to deceive the public in ways that suit their agendas (known as "cherry-picking").

### Dissemination

In the fourth phase of the intelligence cycle, intelligence reports are disseminated to consumers within the government. These range from reports tailored for a specific user (e.g., the president's daily briefing) to those intended for broader governmental readership (e.g., the senior executive intelligence briefing) to those approved for release to the general public (certain national intelligence estimates). As a counterintelligence measure, each type of report is given a classification level and secured accordingly.

### Feedback

In the final phase of the intelligence cycle, policymakers ideally give feedback to the intelligence community regarding the extent to which their intelligence needs were met, including requests for additional intelligence. However, this is an imperfect system, one that opens the door for both the intelligence community and policymakers to succumb to self-deception. Policymakers deceive themselves when they wrongly assume that the intelligence community understands their intelligence needs. Likewise, the intelligence community deceives itself when it assumes that a lack of feedback from policy makers is indicative of

policymakers' comprehension, agreement, or satisfaction with the intelligence that they have received.

## Ethnic Differences

An ethnic group is a group of people who share a common culture. Cultures differ in the incidence of deception, the evaluation of deception, and stereotypes about deception. These contribute to difficulties in cross-ethnic communication.

Researchers have studied cross-cultural differences in the incidence of deception. Historians contend that deception was unknown in many pre-Columbian Indian tribes, and that early Native Americans viewed Europeans' lies as a sign of mental illness. From archival evidence, anthropologists have made inferences about life in 186 preindustrial societies. In some of those societies, children were strongly socialized to be honest; in others, they were not.

Psychologists have done related human subject research. One researcher found ethnic differences in the tendency to give deceptive responses on personality tests. Among students in the United

States, those of Latino background were most likely to lie on personality tests, and those of Middle Eastern background were least likely to lie. Another team of investigators asked lifelong natives of 74 countries how often the typical person tells a lie. Responses varied from country to country. People from Algeria and Pakistan gave the highest estimates of the frequency of deception; those from Portugal and Taiwan gave the lowest estimates.

Cultural differences in deception may depend on the medium in which lies are told. In one study, Koreans reported higher levels of face-to-face deception than Americans. However, Koreans and Americans reported equal levels of deceit in computer-based communication.

Corruption is an institutional manifestation of deception. Transparency International, an organization based in Berlin, has assessed corruption annually since 1993. Its 2011 Corruption Perceptions Index provides a measure of the degree of corruption in each of 183 countries worldwide. By this index, the most corrupt countries in the world are Somalia and North Korea, whereas the least corrupt are New Zealand, Denmark, and Finland. In general, corrupt countries tend to be poor and pay their civil servants badly. Corrupt countries also tend to be collectivistic. In these cultures, the emphasis is on the group, rather than the individual.

### Cross-Cultural Experiments

There have been cross-cultural experiments on the use of deception. In one study, research participants were recruited from four collectivist countries (Japan, Greece, Korea, and Hong Kong) and four individualistic countries (the United States, the Netherlands, Australia, and Germany). Participants engaged in mock business negotiations, in which they could use various tactics to secure a lucrative contract. In this business setting, participants from the collectivist countries were more likely than their individualistic counterparts to tell lies and offer bribes. Outside the laboratory, people from collectivist cultures may have non-business motives for lying. Collectivist Samoans, for example, lie to protect family reputation.

There are ethnic differences in the evaluation of deception. In a 2007 study, residents of Ecuador rated lies as less acceptable than European

Americans. As part of an older world values survey, residents of 43 societies answered the question, “Is lying in your own interest ever justified?” Respondents from Bulgaria and South Korea were most likely to condemn self-interested lying. West German and Dutch respondents were most likely to say that this form of lying could be justified. In all of the 43 societies surveyed, the most highly educated respondents were more likely than their least educated counterparts to find self-interested lying justifiable. Education may reduce moral absolutism.

Not all lies are self-interested; some are altruistic. The Chinese view the latter, prosocial lies, as commendable when, for example, an anonymous donor denies having made a donation. Many Chinese adults do not regard altruistic untruths as “lies” at all. They reserve the term *lie* for falsehoods that are not prosocial. By contrast, a Western definition holds that a lie is any attempt to convince others of something that the liar considers false—even if the attempt is altruistically motivated.

### Beliefs About Deception

People have beliefs about deception, including about the way liars act. In a large-scale research study, lifelong native residents of 58 countries were asked the open-ended question, “How can you tell when people are lying?” Although respondents gave a variety of answers to this question, most often they said that they could tell when people are lying by eye contact. Most people believe that liars avoid looking at their conversational partners. Americans believe that liars avert gaze, and so do people in many other countries. In fact, eye contact was mentioned as a cue to deception more than twice as often as any other cue by the respondents in this worldwide sample. Liars act nervous and they have trouble speaking. These beliefs are also common throughout the world.

There are cultural differences in beliefs about deception. Although in general, people believe they can infer deception from gaze aversion, people from Muslim countries are less likely to express this belief than people from other countries. Similarly, people in most countries believe that liars act nervous. However, the residents of Muslim countries are less likely than others to express this belief.

There are also beliefs about demographic differences in deception. Worldwide, men believe that women lie more often than men; and women believe that men lie more often than women. These beliefs are related to cultural factors. They are most common in countries where there is high gender inequality. Residents of Muslim countries believe that they are more often deceived by acquaintances than strangers.

A large body of research shows that Americans are able to detect Americans' lies. They detect their compatriots' lies at levels slightly better than chance. This finding generalizes to other cultures, including the United Kingdom, Sweden, Germany, and Spain. It also generalizes to some Asian countries. Thus, Jordanians can detect lies told by Jordanians, Indians can detect lies told by Indians, and natives of Japan can detect lies told by other natives of Japan. Within each of these countries, people show a modest ability to discriminate lies from truths.

### **Differences in Nonverbal Behavior and Language**

There are differences in nonverbal behavior across the world. Scholars have described some cultural dimensions that bear on these differences: immediacy, power distance, and context. Along the immediacy dimension, there are high-contact cultures (such as those in the Arabic world) and low-contact cultures (like many in Asia). People in high-contact cultures make more eye contact, stand closer to one another, and engage in more touching than people in low-contact cultures. Highly intense, former Iraqi leader Saddam Hussein personified a high-contact culture.

Along the power distance dimension, there are vertical cultures (such as India) and horizontal cultures (such as Norway). In vertical cultures, status-based norms constrain nonverbal interactions by demanding respect to superiors. Downcast eyes, honorific tones, smiles of appeasement—these behaviors are prescribed in vertical cultures but might be seen as insincere by egalitarians. Cultures also differ in the extent to which communication depends on context. In high-context cultures (like Japan), meanings are inferred from interpersonal relationships and implicit nonverbal codes. In low-context cultures (like Germany), meanings are conveyed by the

content of verbal utterances—logical, explicit, and precise.

Nonverbal differences are also evident across ethnic groups in the United States. An early study in New York City found that Jewish and Italian immigrants used different gestures than native-born New Yorkers. Other research shows that African Americans make little eye contact and that Latino Americans stand close to one another when interacting. Ethnic differences in nonverbal behavior may be especially pronounced in cross-ethnic interactions. In an older study of mock employment interviews, Anglo American interviewers were cool and distant toward African American job applicants. In a second study, job applicants who were treated in a cool, distant manner made bad nonverbal impressions. Thus, the Anglo American interviewers' prophecies were self-fulfilling. In a similar way, people appear to be lying if they are telling the truth to others who think that they are lying.

Can lies be detected across cultures? Culturally based nonverbal differences might in principle frustrate attempts at international lie detection. Nonverbal differences would frustrate lie detection if lies are spotted by virtue of their deviation from a culture-specific communication baseline. Nonverbal differences might, on the other hand, have the opposite effect. They would facilitate international lie detection if people in different cultures infer deception from different nonverbal cues, and liars concentrate on controlling those cues that their compatriots associate with deceit. Then, attempts at international deception would be unveiled by cues that the liar did not bother to hide.

The members of a culture share a common language. Thus, interactions between cultures are often cross-language interactions. Although it stands to reason that language differences would affect cross-cultural attempts to detect lies, it is difficult to know a priori whether language differences would benefit the liar or the would-be lie detector. Perhaps a language barrier would give the liar an advantage by depriving the would-be detector of speech content that could cue deceit; on the other hand, speech content might be a useful vehicle for perpetrating deception, whose absence would force the detector to consider more reliable cues.

### Cultural Views of Foreigners

Nonverbal and language differences are objective features of cross-cultural interactions, but their interpretation depends on interactants' views of foreigners. Here, social psychological research is relevant in showing that most people prefer members of their group to members of other groups. In cross-cultural contexts, this preference may be fueled by uncertainty induced by the unfamiliar. Worldwide, a general suspicion of outsiders may predispose people to be leery of foreigners. Psychologically, it may be natural for people to not believe others who they cannot understand. If so, those who are foreign to a country may be subject to self-fulfilling prophecies and come to act in ways that would appear deceptive, even to their compatriots.

An early study tested for lie detection by students in the United States who were from Asia, Latin America, or the United States. Results showed that the U.S. and Latin American students were slightly better than Asians at detecting Americans' lies. This was not a large difference, however. In another study, Americans of European, Asian, and Latin descent tried to detect one another's lies. The Latin Americans were somewhat better at lie detection, although again the difference was small. A series of studies indicated that white Dutch police officers were vulnerable to misinterpreting the behavior of black Surinamese citizens of the Netherlands. The police saw the blacks' usual mannerisms as signs of deceit. In a more recent study, Australians were able to detect lies told by Colombians. Another study indicated that Americans, Jordanians, and Indians could detect one another's lies, albeit to a modest extent. They could detect lies across not only cultures but also languages. Thus, illiterate Indian farmworkers could detect Americans' English-language lies, even though they knew no English.

Interestingly, lies could not be detected across cultures if the lies were only judged from visual cues. Access to speech was needed. Although the research participants were able to detect lies across cultures, deception judgments of compatriots were more accurate. This study provided no evidence for a generalized suspicion of outsiders. The research participants gave foreigners the benefit of the doubt.

As judges of deception, people agree on who appears the most and least honest. There is agreement across cultures and languages. Thus, American university students and illiterate Indian farmworkers agree on which Jordanians sound honest. They reach significant agreement, even when they judge deception from an audio-only presentation of the Jordanians speaking in Arabic. They reach agreement, despite the fact that neither the American students nor the Indian farmworkers understand Arabic. Similar results are apparent in Jordanians' judgments of Malaysians' lies. Apparently, there are worldwide cues to deception judgment, and some are in the voice.

It is difficult to draw a single conclusion about ethnic differences in deception. Rather, the accumulated research literature reveals that certain ethnicities differ from other ethnicities in particular ways—in the incidence of deception, evaluations of deception, and beliefs about deception. Additional research on this topic would be welcome, particularly research that emanates from non-Western, nondeveloped cultures.

## Evidence, Strategic Use of

Decades of research show that people's ability to detect lies is limited. A synthesis of the literature showed an average accuracy rate of 54 percent—far from impressive when a 50 percent accuracy rate can be expected by chance. Research suggests that the primary reason for this is that cues to deception are too weak to allow for accurate discrimination. The strategic use of evidence (SUE) technique is a method aimed at overcoming this problem. It is an investigative interview technique designed to produce different responses from liars and truth-tellers through systematic use of the available case information or evidence. The SUE technique exploits the strategies used by suspects, with the aim of producing implausible or inconsistent statements from liars. Research has shown that the SUE technique produces differences in the statements provided by liars and truth-tellers, and these differences can lead to higher accuracy rates in detecting deception.

### Counterinterrogation Strategies

The core premise of the SUE technique is that liars and truth-tellers have different strategies to convince, and these differences can be exploited in order to create cues to deception. These strategies, termed *counterinterrogation strategies*, have been examined in different ways. First, theoretical work has connected these strategies to basic behavioral approaches to cope with threatening situations.

Second, studies have empirically examined suspects' strategies during interrogations. The typical methodology of such studies is the mock crime approach, in which some participants are asked to commit a staged transgression, whereas

others engage in some innocuous act. For example, some participants (liars) may be asked to go to a room and steal an object, whereas others (truth-tellers) are asked to go to the same room to simply deliver an object. Then, they are all told that an object was stolen from that room, and their task is to deny involvement in the theft (some deceptively, others truthfully). Before their interview, participants are asked to report their primary strategy for convincing the interviewer of their innocence.

Studies on counterinterrogation strategies show that liars' and truth-tellers' strategies differ, particularly with regard to information management (i.e., the content of the story that they plan to provide). The strategy most frequently reported by innocent people is to simply tell the truth like it happened. This might seem trivial, but it makes sense from the perspective of psychological theory. In particular, the behavior of innocent people is in line with naïve beliefs about justice. The belief in a just world (BJW) sociopsychological theory posits that people have trust in the fairness in the world. They believe that bad things happen to bad people, and good things happen to good people. In other words, if individuals are innocent, they may believe that they have nothing to fear by being forthcoming because the world is ultimately a fair place.

In contrast, guilty suspects face more complicated considerations regarding what information to convey. Liars who aim to cover up some form of transgression must suppress the critical information about the commission of the act in question. However, in order to appear credible, they need to offer an account in place of the truth. Providing false information to conceal one's action (e.g., claiming that one never visited place X, when one in fact did) entails a risk; if the interviewer holds information that the suspect visited this place, the suspect's credibility is in jeopardy.

Striking the appropriate balance between concealing incriminating information and offering details in order to appear credible is a crucial consideration for liars. Studies on liars' counterinterrogation strategies show that their strategies are dominated by information management concerns, such as providing a simple and streamlined story while avoiding or denying incriminating information.

### First Test of SUE

As described above, the SUE technique exploits the fact that liars and truth-tellers differ in forthcomingness. In order to understand how this can be accomplished, consider the first test of the SUE principles. This study employed a mock crime paradigm, in which participants were randomly assigned to be either deceptive or truthful. Liars were instructed to go to a nearby store, find a briefcase in the corner of that store, and take a wallet from the briefcase. Truth-tellers were instructed to go to the same store and look for an object in the same corner. The situation was arranged in such a way that truth-tellers had to move the briefcase in order to look for the relevant object (however, they did not steal the wallet).

There were several pieces of evidence: First, a witness outside the store saw participants enter the store. Second, a store clerk observed participants in the corner of the store. Third, there was evidence that participants had handled the briefcase, because their fingerprints were found on it. This information was true for both liars and truth-tellers; that is, the information suggested, but did not conclusively prove, that participants may have been involved in the theft.

There were two types of interviews. In one condition, the evidence was disclosed in the beginning of the interview, after which the interviewer posed questions about the subjects' actions and whereabouts. In this early disclosure condition, truth-tellers and liars provided similar accounts, which tended to incorporate the evidence without admitting to the theft. For example, both liars and truth-tellers tended to say that they had been in the store and they had handled the briefcase while searching for an object (recall that this was true for some, but not all participants). Lie-catchers who viewed these interviews could not tell the difference between true and false accounts; their accuracy was at chance level.

In a second condition (the SUE condition), the evidence was withheld until the end of the interview while the interviewers asked a number of questions: First, they prompted the suspects to provide a free recall of their actions during the day. Second, they asked specific questions that addressed the evidence, but did not disclose it. For example, suspects were asked to describe the

locations they had visited during the day, whether they had visited the store in question, and if so, whether they had seen and handled a briefcase. The purpose of these specific questions was to highlight the difference in strategies between liars and truth-tellers; that is, to highlight truth-tellers' forthcomingness, and liars' strategies of avoidance and denial.

In this interview condition, the difference between liars and truth-tellers was marked. In response to the free recall prompt, liars often refrained from mentioning the store, and without exception avoided mentioning the briefcase. In contrast, truth-tellers' responses suggested forthcoming approaches: They frequently volunteered information relating to the evidence, such as having been in the store. For the specific questions, further signs of differences in strategy between liars and truth-tellers were obtained: Truth-tellers' responses were in line with the evidence, whereas liars' responses tended to be inconsistent with the evidence (e.g., when asked whether they had seen a briefcase, many liars denied). This difference is termed *statement-evidence consistency* and reflects discrepancies between the subjects' account and the information held. Lie-catchers who saw the interviews conducted in the SUE manner were significantly more accurate than chance in distinguishing between true and false statements.

### Further Research on SUE

Since this initial test, a number of studies have explored the principles of strategic evidence use. Some studies have focused on the optimal timing of evidence disclosure, showing that disclosure of evidence in later, rather than earlier, stages of an interview produces far more cues to deception. In light of these findings, it is noteworthy that early evidence and late disclosure is a common element of law enforcement practice, particularly in the United States.

In addition, research has examined the optimal manner of evidence disclosure. In order to understand different manners of disclosure, it must be recognized that a piece of evidence can be presented in various degrees of specificity. For example, evidence in the form of closed-circuit television camera (CCTV) footage showing a person at Grand Central Terminal in New York

City can, in its most specific way, be presented just as such (e.g., “We have CCTV footage showing that you visited Grand Central in New York recently”). However, the same piece of information can also be presented in a more general way (e.g., “We have information that you visited New York recently”).

Recent research has showed that presenting evidence in a gradual way, moving from more general to more specific framing, can produce internal inconsistencies in the stories of liars. Imagine that a liar, who did visit Grand Central but is motivated to conceal this information, has produced an account in which he denies being in the New York area. If he is presented with the most vague, general framing of the evidence (“We have information that you have actually been in New York”), he may revise his statement to include the information presented, but still aim to conceal the visit to Grand Central (e.g., “Now that you mention it, I did visit New York, but I forgot to tell you because I was never in Manhattan—I only went to Brooklyn.”). If he is then presented with more precise information about the evidence (e.g., that there is evidence that he was in Manhattan), he may be forced to revise his statement yet again. The point is, simply put, to “force” liars to change their statements as the evidence is presented in an increasingly specific form.

The SUE technique is based on theoretical and empirical work on liars’ and truth-tellers’ strategies. Based on these principles, research has developed a number of tactics aimed at exploiting suspects’ strategies in order to create cues to deception (and optimize the value of the evidence). A series of studies shows that strategic use of evidence improves the differences in the stories between liars and truth-tellers, and that these differences make it easier for lie-catchers to make judgments about veracity.

## Evolution and Natural Selection

The value of applying an evolutionary perspective to the study of deception is suggested and supported by several well-documented findings. First, deception is found throughout the animal kingdom, in species ranging from insects to primates to humans. This pattern suggests a deep evolutionary history of deception. Deception is a cross-cultural universal. The following phenomena that are conceptually related to deception appear on Donald Brown’s list of human universals: language employed to manipulate others; misinform, or mislead; masking or modifying of facial expressions; language not a simple reflection of reality;

manipulation of social relations; and manipulation of self-image. Research in developmental psychology suggests that children start manipulating the truth and others at a very young age. Research in social psychology suggests that adults engage in some form of deception on a daily basis. Thus, the use of deception is ubiquitous across species, culture, age, and sex.

An evolutionary approach toward understanding deception focuses on several questions: What adaptive problems related to survival, mating, parenting, alliance formation, or status negotiation might have been solved, at least in part, by the use of deception? What different adaptive problems would men and women have recurrently faced over evolutionary history that could have led to the development of reliable sex differences in the deployment of deception? What are the statistically recurring costs and benefits associated with the use of deception?

### Evolution, Mating, and Deception

Any inherited mechanism or trait that enabled human ancestors to successfully deceive others would be selected for if (1) its use conferred a benefit that contributed to propagation of their genes, and (2) the benefits of its use, on average, outweighed its costs. From an evolutionary perspective, successful mating refers to mating that produces offspring that are likely to survive and thrive. In species that sexually reproduce each offspring carries 50 percent of each of its parents' genes. Thus, producing offspring is the most efficient way to replicate one's genes. Therefore, successful mating is one of the most important processes that drive evolution. However, successful mating requires the solving of a number of distinct adaptive problems. Some of these adaptive problems are similar for men and women; some are different.

In humans, gestation occurs internally within women. Therefore, whereas men can produce an offspring by investing only the time and energy required for a single act of copulation, women must invest substantially more time and energy because of an infant's nine-month gestational period. Because men and women invest different amounts of time and energy into producing a child, they have evolved somewhat different mating psychologies.

Successfully attracting a mate involves outcompeting same-sex rivals for a desired mate's attention. Attracting a mate can involve deception to the extent that one's looks, kindness, generosity, sexual chastity, loyalty, or social status are strategically misrepresented during courtship. Attracting a mate may also involve intentionally misrepresenting information about one's same-sex rivals.

Men have faced the adaptive problem of identifying women who are able to conceive and produce healthy offspring. Therefore, men's evolved mate preferences focus on a woman's physical appearance. Various physical features are considered universally attractive (e.g., smooth, clear, wrinkle-free skin; large, clear eyes; long, thick, lustrous hair; a low waist-to-hip ratio of approximately 0.7 to 0.8; symmetrical features; and firm, symmetrical breasts) because these features are reliable indicators of a woman's reproductive value. Therefore, women use a variety of products, techniques, and procedures (ranging from the use of makeup, push-up and padded bras, corsets and belts, and slimming clothing to diet and exercise and the extremes of plastic surgery) to misrepresent the extent to which they possess the features that men desire.

Men have also faced the problem of paternal uncertainty. This means that men can never know for sure (without a confirmed paternity test) if they are the biological father of putative offspring. Being cuckolded, investing in a competitor's offspring, rather than one's own, would have been and is extremely costly to men's fitness. Therefore, men's evolved mate preferences also focus upon a woman's chastity, sexual reputation, and trustworthiness. For this reason, during courtship, women may deceive potential mates by downplaying the number of sex partners that they have had and by exaggerating their agreeableness, loyalty, and fidelity. Additionally, women may spread false rumors about the attractiveness, character, or sexual histories of their same-sex competitors. Spreading negative information about other women's sexual promiscuity or genuineness can lead men to find these women less desirable as a long-term mate.

Because women incur the heavy costs of pregnancy and lactation, women's ability to raise healthy offspring has depended upon their ability to secure needed resources and protection from

a man. In other words, women face the adaptive problem of attracting a long-term mate who are able and willing to invest in and protect them and their children. Therefore, women's evolved mate preferences focus on physical and psychological traits that are reliably associated with a man's ability to accrue and share resources, along with his ability and willingness to offer protection. Thus, women from around the world generally find the following traits and characteristics desirable in a long-term mate: intelligence, high social status, slightly older age, the ability to dominate other men, kindness, generosity, commitment, love, above-average height, physical strength, athletic skill, courage, and bravery.

For these reasons, a man's use of deception during courtship focuses upon exaggerating his economic resources or his potential to acquire resources in the future, his kindness and generosity, his emotional commitment, and/or his athletic prowess. Additionally, men may spread false rumors about other men's sexual intentions (falsely suggest that another man is a womanizer who is not interested in long-term mating), intelligence (falsely claiming that another is dumb), ambition (falsely claiming that another is lazy or a loser), or health (falsely claiming that another is weak, prone to illness, or has a disease). Spreading negative information about other men's ability to acquire resources, share those resources, or health status can lead women to find these men less desirable as a long-term mate.

### Mate Poaching, Infidelity, and Adultery

For both women and men, attracting a long-term mate may involve mate poaching, the luring away of a mate from an existing courtship. This process involves deception to the extent that mate poaching is a process that is shrouded in secrecy and can involve strategic self-presentation aimed at making oneself appear more desirable than the desired person's current mate. Other aspects of mating that involve the strategic use of deception involve infidelity and adultery. Both women and men engage in infidelity and adultery, although men engage in these behaviors at higher rates.

Engaging in sexual relations with someone other than one's long-term partner, at least in certain contexts and with certain people, can confer fitness benefits to adulterers. For example, over

the long stretch of evolutionary history, before the advent of birth control, men who were able to maintain a long-term relationship while having sex with additional women would have fathered more children. A large and growing body of research evidence suggests an evolutionary history

*At the Minnesota Renaissance Festival in Shakopee on September 2, 2012, the Sisters of the Sahara perform a belly dance, which is thought to originate from ancient fertility rituals. Women use a variety of means to enhance the evolved mate preferences that men identify for producing offspring, such as firm breasts, a low waist-to-hip ratio, and large eyes.*

in which women strategically engaged in infidelity, when the benefits would have outweighed the risks. Almost by definition, adulterous relationships are maintained within an intricate web of secrets and lies.

Other examples that involve women and men using deception strategically within the context of mating include (1) having a “back-up mate,” someone who could readily replace one’s current mate if the relationship were to end (2) maintaining in secrecy one’s attractions to and fantasies about others, and (3) keeping one’s intentions to end a long-term relationship secret until the timing is ideal. These forms of deception, when employed successfully, would have been associated with evolutionary benefits.

### Conclusion

Evolutionary psychology posits that men and women will be expected to differ from each other in domains in which they recurrently face different adaptive problems. This logic has been successfully used to document how and when women and men use deception similarly and when they use it differently.

In addition to identifying the benefits associated with deception, an evolutionary analysis also highlights the costs associated with the use of deception. Being identified as a liar or an adulterer can be associated with the loss of valuable relationships, irreparable damage to one’s reputation, lowered social status, or ostracism. In the most serious cases, liars or cheaters may be physically harmed or murdered. All of these outcomes would reduce one’s likelihood of successfully propagating one’s genes.

That deception is a ubiquitous feature of human nature suggests that humans have evolved to be highly skilled deceivers and manipulators. However, when people lie and manipulate, they impose costs on the recipients of their deceptions. Thus, people would be expected to evolve solutions to the problem of being duped, namely an ability to detect deception. The evolution of the ability to deceive, along with the evolution of the ability to detect deception, is an example of a coevolutionary arms race. However, evidence suggests that people are fairly skilled at deceiving others while they are relatively unskilled at detecting deception.

This discrepancy suggests the possibility that on average, the benefits of deceiving others outweighs the costs of deceiving others, and the average benefit of detecting deceit may not exceed the average cost of failing to detect deception.

Recent theorizing within evolutionary psychology on the topic of self-deception suggests that being unaware of one’s intentions to dupe and deceive increases one’s ability to successfully deceive others. Thus, an evolutionary lens has been fruitfully applied to the topic of deception in humans. However, many questions about the evolution of deception, in its many forms, remain.

## Exaggeration

Exaggeration has been a familiar part of society since at least the time of Aristotle. Whether it is exaggeration in literary form or in everyday life, exaggeration is a cognitive behavior to which society has become accustomed. Exaggeration may be as simple as representing the characteristic value of an item to be greater, better, or larger than it actually is.

The word *exaggerate* comes from the Latin word *exaggerare*, which translated means "to magnify." Because of the prevalence of exaggeration in everyday life, it could be argued that society has become immune and desensitized to this particular form of deceit. Some form of exaggeration can be found in every facet of daily activity, from literature and media to personal expressions of prowess, educational success, and even to the practice of law.

Part of the reason that exaggeration is so prevalent is that society is currently in what some scholars have termed "the trophy generation." As the trophy generation, everyone wants to be recognized and given the "most valuable player" status. The mentality is so strong and accepted by society that exaggeration has become a protected form of speech, further obscuring the lines between reasonable expectation of truthful disclosure and the commercial interest in relentless self-promotion.

The foundations for exaggeration go back in time to the dawn of man. In ancient Greece, the Alazon was one of the three fundamental characters of the comedic theater. The imposter who sees himself greater than he actually is becomes the repeated subject of plots to embarrass or destroy him and enjoys a continued implementation into modern-day television and movie scripts. Aristotle describes such individuals as "boasters" who

pretend to have distinguished qualities not actually possessed, or individuals who exaggerate the true nature of their being. First recorded in English-language writings during the 1560s, the term *exaggerate* may have originally been defined as "to pile up" or accumulate. Certainly throughout history it is not unforeseeable that the Alazons of real life often "pile up" the false recollections of otherwise truthful events, even to the point of intentional deceit.

### Exaggeration and Psychological Disorder

Cognitive distortions of events may be extremely damaging to social interaction for individuals and often lead to maladaptive behaviors that require enhanced therapy for coping. Exaggerated, irrational thoughts perpetuate many forms of psychological disorder. Although almost all have been guilty of "jumping to conclusions" at some point in life, the repetitive action of probability overestimation or exaggerating the likelihood of negative outcomes for an event often leads to obsessive-compulsive disorder, wherein no amount of repetitive hand washing can preclude the anticipation of sickness. Similarly, exaggerating the importance of events through catastrophizing a single negative event into a neverending pattern of defeat often spirals into self-reinforcing cycles of depression.

The narcissist exaggerates the true nature of their being into grandiose infallibility, and the psychosomatic exaggerates the perception of symptoms in belief that personal illness is ever impending. Such paranoia is not uncommon, and the psychology text books are replete with a variety of diagnosis wherein exaggeration of true events leads to negative outcomes for the aggrieved individual. The most extreme exaggeration may be seen in those afflicted with Munchausen syndrome, or worse still, Munchausen by proxy, wherein an individual deliberately exaggerates, or even fabricates, physical health problems for those in their care in an effort to fulfill their need for positive attention from others. An often misunderstood form of child abuse, Munchausen by proxy often results in the perpetrator receiving even greater reinforcement for the illness by assuming the heroic role of continued caregiver after the afflicted victim is attended to by a physician.

### Academic and Business Exaggeration

Scholastically, society has grown accustomed to the exaggeration of educational endeavors whereby the inflation of grade point averages (GPAs) across colleges and universities, while serving the need to encourage students to remain enrolled, has systematically deflated the value of knowledge acquired. The trophy generation values the accomplishment of the college degree, rather than the acquisition of true knowledge. The once coveted mark reserved for exalted student performance, the “A,” is now a commonplace occurrence. Exaggerated GPAs ultimately depreciate the value of a college degree, potentially promoting a culture of underachievement. Students have grown accustomed to demanding higher grades for merely satisfactory or even substandard work. Institutions have embraced the exaggeration of student effort for fear of diminution in enrollment and loss of the primary capital resource, the student. The resultant depreciating inventory of ingenuity is likely to one day reverse the role of exaggeration in education when faced with the reality of future demands for competitiveness in the enhanced global society. The systematic dumbing down of required efforts for exceptional acknowledgment has resulted in a reclassification of the knowledge, skills, and abilities required for successful job performance, once graduated.

Although often perceived as most prominent in private life, exaggeration also carries negative connotations of implementation within the business community. The entrepreneur often exaggerates the size of the organization in an effort to bolster the value of the operation. The applicant exaggerates the acquisition of knowledge, skills, and abilities in hope of securing a sought-after employment position. Although not as prevalent today, prior to the Sarbanes-Oxley Act of 2002, exaggeration of revenue through creative accounting of organizational debt elicited enhanced investor support where it was not warranted.

Exaggeration remains commonplace in business as executives often exaggerate their relative power within the organization through creative means, such as the use of an oversized desk, a locked file cabinet, or causing others to wait on standby for the satisfaction of an audience with the executive. Exaggeration of power may take

such simple form as utilization of a rectangular conference table, wherein the executive sits at the head of the table. Even the more common show of exaggerated relative worth through the display of personal assets, such as the car driven or the watch worn, is not only accepted but is expected among certain professions within the medical or legal fields.

Exaggeration has, in fact, become so prevalent in the practice of law that most state bar associations have adopted rules and regulations to moderate attorney behavior. Exaggeration in the practice of law is most prevalent in advertising and misrepresentations of a specific attorney's capability and legal prowess. Such abundance of exaggeration has led many states to specifically define where the line is drawn between acceptable puffery and false advertising that improperly influences the choice of legal counsel. While accurate and truthful self-promotion is allowed and encouraged within the practice of law, unchecked and overly exaggerated statements are dangerous for an attorney, and will often lead to disciplinary actions. Regardless of the reason for exaggeration, it is a dangerous tool for attorneys to use. The use of exaggerated claims and statements can result in legal malpractice suits and disciplinary actions by the bar association.

### Positive Exaggeration

Exaggeration in every form should not be viewed as completely inappropriate or harmful. The power of positive exaggeration can be the precursor to profound personal transformation. Every athlete at the time of competitive performance has been advised to envision the successful accomplishment of his or her goal. Such exaggeration or mental distortion of future events enhances the individual to a higher level of locus of control. Successful individuals often derive their achievement through positive utilization of their individual talents and the belief in the mastery of their outcome. Exaggeration may be a fundamental element of expressing great joy and excitement.

Exaggeration is often utilized through personal expressions within love relationships, because the normality of language usually falls short of adequate communication of such great feelings. Further, exaggeration is a powerful method of

indicating key points that would otherwise not receive appropriate concern by the recipient of such messages. Despite all shortcomings to the practice of overt exaggeration, this particular form of lying and deception is so ingrained in individuals that it will continue to influence society well into the future. Whether in the executive boardroom or the psychotherapist's office, or the student transcript, the subtle alteration of the true characteristics of an event through exaggeration is a common occurrence to be accounted for, rather than overlooked.

communication. The eyes and the surrounding muscles play a huge role in providing meaning when communicating. It is believed that up to 55 percent of meaning comes from the eyes. Studies over the years have shown that eye contact during a typical conversation ranges from 30 to 60 percent, with longer eye contact indicating stronger interest in either the person or the topic. It is normal as adults to regularly scan interactional partners' eye behavior to receive important information about mood, mental state, confidence, dominance, and credibility. Meaning is conveyed through nonverbal behaviors, including facial expressions and eye contact.

Researchers and practitioners have been interested in the role that eye contact plays in detecting lies for decades. According to Aldert Vrij, a leading deception researcher, to date there is no evidence linking eye contact and eye behaviors to deception. However, there are several theories of deception that incorporate the role of the eyes in lying during interaction. M. Zuckerman's four-factor model of deception, B. M. DePaulo and S. E. Kirkendol's motivational impairment effect, and D. B. Buller and J. K. Burgoon's interpersonal deception theory all include eye behaviors when explaining deception.

#### Four-Factor Model of Deception

Zuckerman and his colleagues developed the four-factor model of deception, which states that when people tell lies, there are four underlying mechanisms at work: arousal, control, emotions, and cognitive factors. By studying visual, paralinguistic, and verbal cues, Zuckerman and others have identified how and when some behaviors are associated with deception.

Arousal includes both the psychological and physical arousal thought to be caused by an act of deception. When a person lies, his or her arousal is increased. This can be seen by an increase in pupil dilation and a reduction in blinking. The second factor, control, refers to the attempt made by liars to control the way in which deceit is leaked by nonverbal cues. This is often called "leakage." Research over the years has revealed that facial expressions are the least revealing because people are better at controlling their facial expressions. The third factor offered by Zuckerman is emotion. Deception is a

---

## Eye Contact

It is often said that the eyes are the windows to one's soul. In 1905, Sigmund Freud stated, "He that has eyes to see and ears to hear may convince himself that no mortal can keep a secret. If his lips are silent, he chatters with his fingertips. Betrayal oozes out of him at every pore." Researchers over the decades have documented that nonverbal behavior carries much communicative power, providing meaning during interpersonal

complex emotional phenomenon, which is made up of several emotions. When someone lies, his or her emotions change over the course of the deception. Micromotions in facial muscles can betray hidden emotions, which may affect the eyes. The final factor identified is cognitive factors, or thinking. One's thinking pattern changes when lying, and in order to remain coherent, more cognitive effort is required. Zuckerman and colleagues found that changes in cognitive effort influences speech patterns, which can alter pupil dilation; pupil dilation is one sign of deception.

### Motivational Impairment Effect

DePaulo and Kirkendol's motivational impairment effect theory states that a liar's behavior is altered by his or her overcontrol of their behavior. Behaviors are less natural and unscripted, and are more rigid and static. The change in behavior is noticed more in the hands and lower limbs because it is thought that liars are busy

controlling other movements, such as facial and eye movements. Research shows that eye contact is one of the most commonly used nonverbal cues for detecting deception. However, most liars do not avoid eye contact; rather, they may engage in more eye contact than when telling the truth.

### Interpersonal Deception Theory

In 1996, Buller and Burgoon introduced a communication theory to understand deception as an interactional process in which individuals are simultaneously encoding and decoding messages over time. The deceiver or liar attempts to manipulate messages in order to be untruthful. The communicative process of telling a lie may cause apprehension in the liar, allowing the lie to be leaked via cues. Interactional partners simultaneously try to detect the validity of the information that may cause suspicion. This process is like an interactional dance between the liar and the listener.

*Locked in eye contact, a couple engages in conversation at an outdoor festival in New Orleans, Louisiana, July 23, 2011. Several studies have shown that eye contact during a typical conversation ranges from 30 to 60 percent; the longer the eye contact, the stronger the interest in either the person or the topic. An estimated 55 percent of meaning comes from the eyes, and adults regularly scan interactional partners' eye behavior to receive important information about mood, mental state, confidence, dominance, and credibility.*

According to Burgoon and Buller, “liar behavior includes manipulating information, strategically controlling behavior and image management. Liars manipulate information so that they can extricate themselves if the message is found to be false. The liar uses vague generalizations and talks about other people. He strategically controls behavior so as to suppress signals that might indicate that he is lying.” There are three aspects of deceptive messages. The first aspect is the central deceptive message, which is usually the verbal lie. The second aspect is the ancillary message of the deception, which extends to include the nonverbal cues. Researchers maintain that it is often the nonverbal cues that reveal the truthfulness of a message. The final aspect is the inadvertent behaviors of the lie, which are almost always nonverbal. These inadvertent behaviors are intentionally leaked. Both the ancillary messages and the inadvertent behaviors may link to eye contact and eye behaviors.

According to this theory, liars are strategic in how they communicate, both verbally and non-verbally. Liars may try to strategically alter their facial experiences, such as smiling or nodding to make themselves look more credible. Burgoon and colleagues have found that liars continue to modify their behaviors, such as eye behavior, to appear more credible. For example, liars may withdraw their gazing less frequently, change their blinking rate, and dilate their pupils.

Individuals trust other people more when they look them in the eye; research shows that skilled liars know this and adjust their behavior. Eye

contact is an important nonverbal cue that provides meaning when communicating; however, liars may use eye contact in a manner that is the opposite of how people believe them to use it. Deception is a strategic communicative process, and eye contact is one of the easiest behaviors to control. If one suspects an interactional partner of deceit, he or she should watch for changes in rate of blinking, pupil dilation, and possibly increased eye contact.

# F

## Fairy Tales

Deception is often featured in popular fairy tales. Fairy tales can promote the moral that bad things happen when people lie, as in the story the “Boy Who Cried Wolf.” Fairy tales also highlight that only bad characters lie, suggesting that good people do not lie, a pattern found in fables such as “Little Red Riding Hood” and the “Three Little Pigs.” Finally, fairy tales can show a more nuanced and pragmatic theme of deception, that in which characters, both good and bad, lie to acquire what they want or need. In these stories, the lie is judged on the motivations for why the character lied. Examples of this can be seen in “Snow White,” “Hansel and Gretel,” and “Cinderella.”

### Tales in Which Bad Characters Lie

The “Boy Who Cried Wolf” is a famous Aesop’s fable about a shepherd boy who amused himself while watching the village sheep by falsely yelling, “Wolf! Wolf!” to make the villagers run up the hill to protect the flock. Both times that he yelled this, he was lying—there was no wolf. By the time a wolf actually came and the sheep needed protecting, the villagers did not come because they no longer believed the shepherd boy when he called. One of the villagers later explained to the boy his wrongdoings: “We’ll help you look for the lost

sheep in the morning. Nobody believes a liar . . . even when he is telling the truth.”

In this story, the moral is that bad things happen when people lie. Readers see the direct consequence to the boy’s credibility when he is discovered to be lying. The moral is stated at the end of the fable as, “Even when liars tell the truth, they are never believed. The liar will lie once, twice, and then perish when he tells the truth.” In other words, it does not take many lies to make a liar, and when someone is considered a liar, this person suffers the consequences. In this case, the shepherd boy is not initially portrayed as a “bad character,” just a bored, troublemaking boy. However, he pays the price for his lies—both in terms of losing the sheep and ruining his reputation.

The message that if characters lie, they are bad, is also common in other fairy tales. In “Little Red Riding Hood,” a girl encounters a wolf in the woods on the way to her grandmother’s house. She tells him where she is going, and he suggests that she pick some flowers to bring to her grandmother. While she does this, the wolf goes to the grandmother’s house, calls to the grandmother as if he was the little girl, and then eats her. The wolf then disguises himself as the grandmother, and when Little Red Riding Hood arrives at the house, he eats her too. Luckily, a passing woodsman saves the girl and her grandmother by cutting them out of the wolf.

In this story, the wolf lies on several occasions: He deceives the girl into thinking that he was just making a nice suggestion when he tells her that she should bring flowers, which gives him enough time to eat the grandmother; he pretends to be the girl when he knocks on the grandmother's door; and he disguises himself as the grandmother to lure the little girl in and eat her. One may argue that the wolf uses selective self-presentation in this story. He is concerned with the way the girl initially perceives him because he has ulterior motives and wants to lull her into a false sense of security. For this reason, he attempts to manage her first impression of him as a harmless, almost kind character—as seen when he suggests she stop to pick up some flowers for her grandmother. This is all part of the wolf's devious plan, but he succeeds in misleading the girl. As punishment for the wolf's deceit and crimes, the woodsman helps the girl and her grandmother fill the wolf's body with stones, so that when he wakes up, he can't move and falls down dead.

In the "Three Little Pigs," each pig builds a house: one of straw, one of wood, and one of brick. When the wolf comes, he lies to the pigs and tells them that he only wants to talk to them and that they should come out of their houses. He ends up blowing down the straw and the wooden houses. Luckily, the two other pigs escape to the third pig's house, which is built of brick. When the wolf tries to climb down the chimney, the pigs light a fire underneath him. The wolf is badly burned and runs away. The wolf's efforts to deceive the pigs results in punishment.

### **Lying for Both Good and Bad Reasons**

A different message emerges from tales in which both good and bad characters lie to acquire what they want or need. In these stories, bad characters' lies are motivated by selfishness and a desire or willingness to harm others in order to acquire what they want. In this more pragmatic form of understanding deception, good characters also lie, but they do so to protect themselves from harm by others, or to protect someone else.

"Snow White" is a classic example of this pattern of deception. The lies begin with a good character, the huntsman, who has been ordered by the queen to kill Snow White and bring back her lungs and liver. The huntsman takes pity on the girl and lets her live. He kills and returns with

parts of a wild boar instead, pretending to have followed orders.

Later, when the queen's magic mirror informs her that Snow White is alive, the queen tries to deceive the girl through disguise. She visits the dwarfs' house pretending to be a peddler selling silk bodices. When Snow White lets her in, the queen tightens Snow White's bodice, causing her to faint. The dwarves save her, and when the queen discovers she has failed, she dresses up again and returns with a poisonous comb. Once again, Snow White is fooled and lets the woman comb her hair, which causes her to faint. Snow White survives, so the queen makes a poisoned apple and disguises herself as a peasant. The queen only poisons part of the apple, so she offers to eat half, secretly giving Snow White the poisoned half. Upon biting into the apple, Snow White dies.

One day, a prince seeking shelter in the dwarfs' home sees the beautiful Snow White in a coffin and begs the dwarfs to let him keep it. As his servants carry the coffin out, one trips and this dislodges the piece of poison apple in Snow White's throat. She comes alive once again, and she and the prince live happily ever after.

In this story, the two main deceptive characters are the huntsman and the queen. The huntsman lies to save Snow White's life by betraying the queen, and this betrayal is portrayed as a heroic act. The queen is also deceitful throughout this story, but her lies are motivated by selfishness, and she goes out of her way to cause Snow White harm. Through the use of disguises, she fools Snow White multiple times into letting her in and tries to hurt her. People often do not want to believe that someone is lying to them because it is easier to live a trusting life than a suspicious one. There is also evidence of self-deception in this story, in that the queen continually misleads herself into thinking that it is she who deserves the title "fairest of them all."

In "Hansel and Gretel," two children's parents abandon them in the woods in order to avoid all four of them starving. Hansel and Gretel, however, find their way back because Hansel creates a path of stones that they follow. When there is again not enough food for the whole family, the parents drag the children so deep into the woods that the children cannot find their way back. In the forest, they find a house made of bread, cake,

*An illustration by Carl Offterdinger depicts Little Red Riding Hood questioning her "grandmother," whom the wolf has eaten. This fairy tale emphasizes that if characters lie, they are bad; the wolf uses deceit numerous times in the story, and he ends up dead.*

and sugar. An old woman living inside invites them for a meal and makes two beds for them. However, the woman is only pretending to be nice, and is actually a wicked witch who plans to capture, kill, cook, and eat the children. The witch opens the oven and tells Gretel to climb in to see if it is hot enough, but her intention is to close the oven and bake Gretel. Gretel knows what the witch is thinking and pretends that she does not know how to climb inside. The witch becomes frustrated and climbs into the oven to demonstrate. Gretel then shoves her into the oven and frees Hansel. The children then take pearls and precious stones from chests that the witch had been saving, find their way back to their parents' house, and live happily ever after.

In this story, all of the characters lie. The parents tell Hansel and Gretel that they will come

back for them, when they will not. They are selfish and motivated to deceive the children by their desire to keep the little food that they have to themselves. In the process of acquiring what they want, the parents allow Hansel and Gretel to fall in harm's way. The witch pretends to be nice and says that no harm will come to the children, when she actually plans to eat them. Gretel lies when she pretends not to understand the witch's orders to climb into the oven. Her lies are told in order to protect her and her brother from undue harm. Similar to the deception in "Snow White," Hansel and Gretel do not want to believe that they are being lied to—both by their parents and the witch. In the case of their parents, the children wanted to believe that their parents were being honest when they said they would come back for them. With the witch, the children wanted to believe that they were really getting food and a place to sleep because they were hungry and tired.

The story of "Cinderella" portrays a similar theme of good and evil characters lying for a reason. The evil stepmother deceives Cinderella when the girl asks to go to the ball to meet the prince. Over and over again, the stepmother gives her difficult chores to complete within an unfair time limit, and says that if Cinderella succeeds, she may go to the ball. Each time, when Cinderella does as she is told, the stepmother gives her another task. The stepmother ultimately tells Cinderella that she is ashamed of her, and forbids her from going to the ball. Because the stepmother is selfish and wants to give her own daughters the best chance to impress the prince without competition, she deceives and abuses Cinderella. Her tasks are difficult, and her words are hurtful—but she does not care about harming Cinderella; she is determined to get what she wants. Cinderella also lies in the story, pretending to have been asleep upon her stepfamily's return from the ball, although she had been at the ball against her stepmother's orders. She tells this lie to protect herself from harm, because she knows that if her stepmother and stepsisters find out that she was at the ball, they will unfairly abuse and punish her—a fate that she does not deserve.

### Conclusion

Deception is an important moral in many fairy tales, playing a role in plot development and the

message of the tale. There are at least three ways in which this deception presents itself throughout these stories. Deception in fairy tales can be used to teach that bad things happen when people lie, or that only bad people lie. A subtler message emerges in fairy tales that depict both good and bad characters using deception to achieve their goals, and the judgment of whether the lie is acceptable or not is determined by the goal, rather than simply the act of deception. The fairy tales included here are a small sample of stories in this genre that incorporate deception. It is also important to note that while the instances of deception in these tales are almost always the same as they are told and retold, each tale has several different versions as it has been passed from generation to generation and culture to culture.

## False Advertising

False advertising, like many other forms of lying and deception, can involve the exaggeration of an item's characteristics. False advertising, however, goes beyond mere exaggeration, and often involves the intentional misrepresentation of a product for the purpose of financial gain.

Dating back to biblical times, deceiving a buyer by misrepresentation in furtherance of a sale is not a new concept. Statutory protection from such deception in the United States today only dates back to the establishment of the Federal Trade Commission Act of 1914. Most every state has enacted some form of legislation against unfair and deceptive trade practices. Additionally, the very nature of commercial speech to which advertising rules would apply only enjoys limited protection of freedom under the First Amendment, obscuring the line between allowable puffery and harmful misrepresentation, which may only be resolved in the courtroom.

False advertising encompasses not only the overt expression of an inaccurate material characteristic, but more often includes the omission of a product characteristic, which a consumer would find material to the purchase decision. The latter form of false advertising is the most complicated to regulate because it may be impossible to substantiate the intent to defraud on the part of the seller.

### Federal and State Regulation

The Federal Trade Commission (FTC) is responsible in part for protecting consumers from unfair and deceptive practices, which are generally the result of improper advertising. The Bureau of Consumer Protection within the FTC is authorized to investigate and litigate cases that are alleged as deceptive or unfair to consumers. Important to note is that it is the Division of Marketing Practices within the Bureau of Competition of the FTC handles some aspects commonly thought of as directly related to consumers, such as fraudulent telemarketing schemes, 900-number programs, and franchise disclosures or business opportunities.

Despite inception of authority in 1914, it was not until the 1970s and pressure by consumer protection groups that the FTC took a more proactive role in regulating advertising and the

misrepresentations so often causing harm. Further enactment of the Magnuson-Moss Act of 1975 and the establishment of restitution for damages exceeding a paltry \$5 prompted the FTC to set the enforcement of laws regarding false or misleading advertising as a top priority. Additionally, the agency may levy civil penalties of up to \$10,000 for each violation subsequent to an FTC order to cease and desist deceptive activities. The powers of the FTC as a federal agency are founded in interstate commerce, and as such, regulation and enforcement is limited when product vendors fall outside the classification of their jurisdiction.

False advertising and misleading representations for commercial enterprise is also regulated by several other federal agencies having more direct jurisdiction over the subject matter of the goods or service promoted. The Federal Communications Commission (FCC) was founded in 1934 to regulate broadcast communications, now encompassing radio, television, telephone, and telegraph industries, as well as more recent Internet and cable/satellite communications. While the FCC's primary means of control over false advertising is through the issuance or denial of licensure to broadcast, the power to purge improper ads also exists; close working relations with the FTC are maintained for litigious, prosecutorial measures.

Additionally, the Food and Drug Administration (FDA) has jurisdiction over the advertising of packaged foods and drugs, including labeling and ingredient listing. Founded in the Pure Food and Drug Act of 1906, the FDA has become a more aggressive regulator in recent years, despite the limitations in authority over nutritional claims made in food advertising. The FDA continues to battle false advertising claims regarding commonly used descriptive terms such as "natural," "light," or "fat free," even when vendors defend such claims on the basis of mere puffery in promotion of their products.

The U.S. Postal Service (USPS) maintains control over the use of direct-response mailers involving deceptive or fraudulent advertising. More commonly, a violation under the jurisdiction of the USPS takes the form of utilization of the U.S. mail to receive orders and payments for such falsely advertised products, and many have been prosecuted by the USPS for such violations.

False advertising of products that are not shipped, sold, or promoted outside the geographical confines of a single state may likely fall outside the jurisdiction of federal regulatory control. Most states have enacted some form of uniform unfair and deceptive trade practices act to offer consumer protection under similar circumstances. Often, state statutes carry concurrent prosecutorial opportunities, and may even involve criminal penalties for overtly deceptive false advertising.

### **Characteristics of False Advertising**

Engaging in deceptive trade practices related to false advertising involves representing goods as new when they are deteriorated, altered or reconditioned; representing that goods or services are of a particular quality or grade when they are not; advertising goods or services with intent not to sell them as advertised; advertising goods or services with intent not to supply reasonably expected public demand, unless the advertisement discloses a limitation of quantity; making false or misleading statements of fact regarding the reason for, existence of, or amount of price reduction; or engaging in any other conduct that similarly creates the likelihood of confusion or misunderstanding. False advertising violations are not merely reserved for corporate enterprise but may be perpetrated by any individual engaged in the transfer of goods or services for exchange or value, and this is where the power of state sanctions is likely derived. Individuals engaged in similar acts are equally liable for violations, despite often embraced defensive claims of First Amendment protections for free speech.

The extent to which claims of false advertising lead to violations of deceptive trade often pivots on claims of protected speech under the First Amendment of the U.S. Constitution. Advertising of all forms is done with the intent to generate a commercial transaction between two parties. Commercial speech enjoys a limited measure of protection under the First Amendment because advertising does not necessarily contribute to the democratic decision-making process, and thus is not entirely free to be spoken without restraint. Advertisements by nature are intended to induce a consumer in the utilization of specific goods or services, wherein overtly false advertising may be seen as fraud in the inducement on the part of the vendor. Individuals

engaged in commonplace transactions, such as private sale or personal barter, are equally subject to state restrictions regarding deceptive claims. Often not understood by individuals, the constitutional protections do not extend to misrepresentations, nor do they negate the individual's duty to disclose under some claims of caveat emptor. Misrepresentations of false advertising need not be reserved to overt expressions, but are often prosecuted predicated upon deception from omission of material information with intent to persuade the individual purchase or exchange.

### Omission and Implied False Advertising

The duty to disclose is well established when known defects are present; however, false advertising may also include omission of material

information likely to mislead a consumer. Such deception is punishable under the FTC and most state-derived protection laws. Unlike express representations, in which the deception may be easily determined through examination of the false advertisement, omission of material facts that mislead a consumer is likely to be determined only through extrinsic evidence from consumers that such omission rose to the level of false advertising.

Claims of implied false advertisement are difficult to prove. However, prosecution may be based upon the presumptions of a reasonable consumer that may be misled to his or her detriment from information not otherwise disclosed within the advertisement. A company is not liable for every interpretation that a consumer may derive from the advertisement, nor must the misleading interpretation of a reasonable consumer be the only one derived. When a seller's omission of information conveys more than one meaning to a reasonable consumer, one of which is false, the seller is liable for the misleading interpretation. Similarly, an interpretation will be presumed reasonable if it is the one that the seller intended to convey.

Key to the determination of false advertisement through failure to divulge information is that the nature of the omission must be material to the reasonable consumer's decision. A material characteristic of an advertisement would be useful to a similarly situated consumer when making a decision to purchase or exchange for the advertised goods or services. When knowledge of the omission might have caused the consumer to make a different decision, the failure to disclose such information can be found to constitute false advertising. Equally deceiving may be the implied portrayal of goods or services in a more positive character than they actually are. Claims of materially misleading false advertisement must be investigated by review of the totality of the advertisement as to whether the ad would deceive a reasonably prudent consumer at which the advertisement was targeted.

### Conclusion

False advertising is not a new form of lying and deception, having been around for as long as there have been transactional exchanges between two individuals. Modern regulation after the age of the Industrial Revolution has attempted to define

Around the turn of the 20th century, consumers were offered some "friends" for weight reduction: tapeworms! Even though this "easily swallowed," "sanitized," and "jar packed" product proved ineffective, the Federal Trade Commission did not really focus on deceptive advertising like this until the 1970s.

with specificity the representations of a seller that may otherwise be deceptive or misleading to a consumer. Federal as well as state legislative acts penalize sellers for making false advertisements. When the misrepresentations are derived from omission of material information, or implied portrayal of a product in a better light than in actuality, prosecution of false advertising heavily relies on the interpretation of the entire ad by a reasonable consumer to which the advertisement was directed. Despite the best efforts of regulatory officials, an individual engaged in any form of commercial trade or transaction should always assume some independent responsibility to heed the warning of buyer beware.

## False Confessions

A false confession is obtained when a person admits or pleads guilty to a crime that he or she did not commit. Skeptics suggest that false confessions are statistically rare. However, when a confession is the primary evidence in a conviction, and the crime is re-examined with new forensic DNA evidence, 25 percent of the time the evidence indicates that the confessor could not have committed the crime.

False confessions have far-reaching consequences, tearing families apart, condemning the innocent to prison for crimes that they did not commit, and damaging the validity of the entire criminal judicial system. If the goals of legal systems are justice, convicting the guilty, and exonerating the innocent, the prevalence of false confessions is in direct contrast to those aims.

### Types of False Confessions

There are three main types of false confessions: voluntary, compliant and internalized false confessions. A voluntary false confession is one in which the suspect freely confesses, without any police interference. Sometimes, these voluntary false confessions are made in order to divert attention from the actual guilty party, such as a friend or relative. Other times, voluntary false confessions are made in order to gain notoriety and attention from the confession, if the crime is making news headlines.

A compliant false confession is given in order to end a stressful situation or police interrogation. The suspect often believes that if one confesses to the crime, one can prove his or her innocence later. Manipulation and coercion by the interrogator

often play a significant role in the attainment of a compliant false confession.

The last type of false confession is the internalized false confession. This type of false confession often requires the suspect to be easily impressionable, such as a child, an elderly person, a person in a heightened state of stress or grief, or someone who suffers from a psychological disorder or certain learning disabilities. In these cases, the interviewer implants the belief of guilt into the suspects' minds through sophisticated manipulation and persuasion in order to make the suspects at first question their memories and then come to accept the interrogators' version of events.

### **Reid Interrogation Technique**

Interrogation techniques that presume guilt initially confront suspects with what seems like insurmountable evidence of their guilt, and are structured to not allow the suspects to directly deny the crimes. Confessions obtained through this type of interrogation have been shown to increase the likelihood of false confessions in susceptible individuals. The work of Elizabeth Loftus on false memories delves into greater detail about the ways in which people can construct false memories, without even realizing that their memories are false. This creation of false memories often leads to false confessions during stressful interrogation.

In the United States, the Reid method of interrogation is the most popular type of police interview technique. While it is a step forward over the use of physical force and food/sleep deprivation, this technique still has flaws, including its susceptibility to false confessions. Critics claim that the Reid method is less concerned with the truth and more concerned with simply obtaining a confession. The Reid method is a two-stage process: Stage one is a nonaccusatory behavioral-analysis interview with the suspect in order to gain trust and rapport, obtain general background information, and determine whether or not the suspect is lying about his or her defense. If the suspect is deemed to be lying, then the interviewer continues to a more aggressive stage two, which consists of a nine-step accusatory-style approach in order to gain a confession.

The problem with the Reid technique, and the reason for the high false confession rate, is

that the approach is based on breaking down the suspects, pushing past their resistance and "denial" in order to gain a confession based on a presumption of guilt. The Reid method involves detaining and isolating the suspects in order to create heightened anxiety, thus weakening the resistance to admission. Though not officially an element of the Reid technique, interrogators have been known to present false incriminating evidence to suspects in order to trick them into believing their guilt.

In the confrontation phase of the interrogation, the interrogator has the ability to present falsified or unsubstantiated information to the suspects, convincing them that they must be guilty. Often, the interrogator will suggest to the suspect that he/she must have blacked out during the crime, which would explain why the suspect does not remember committing it. The unethical use of false evidence and the manipulative tactics often used in conjunction with the Reid interrogation method results in innocent people offering up a false confession as a way to end the long and exhausting interrogation process. If suspects are additionally susceptible, they may come to believe the version of events as presented during the questioning as their own memories.

### **PEACE Interrogation Model**

In other countries, such as the United Kingdom, the PEACE model of interrogation is in place. PEACE stands for Preparation and Planning, Engage and Explain, Account and Clarification, Closure, and Evaluation. This technique is grounded more in fairness, accountability, and the discovery of facts and truth, rather than merely obtaining a confession. The PEACE method does not heavily rely on presenting strong evidence in order to obtain a confession, which drastically reduces the likelihood of a false confession. The PEACE method reduces the number of false confessions that can result from unethical police interrogation tactics, such as lengthy interrogations.

After a suspect has been in an interrogation for 12, 24, or 48 hours, the rate of false confessions drastically increases because suspects are at or near their breaking points and they will do anything to end the interrogation. The PEACE model follows a more formalized and regulated methodical approach to interrogation, with the hope that

suspects will confess to a crime when guilty but will not feel pressured to do so if innocent. The PEACE method, while not as manipulative as the Reid approach, still yields a high confession rate, resulting in some false confessions.

A confession is often seen as very strong evidence and is often enough to convince a jury to convict. In the past, although physical samples were collected at the scene of the crime, science did not have the means to analyze DNA. Scientific advancements in DNA testing from crime scenes have reduced the need for confessions and have provided definitive evidence that false confessions are a problem in any justice system.

False confessions (though counterintuitive) more frequently occur than hoped, partly because of interrogation strategies and findings that individuals' memories are questionable when they are in a susceptible state. However, with modern advancements in science regarding DNA testing and DNA databases, and shifting to new interrogation techniques that do not presume guilt, it is expected that false confessions will become less likely, but still common enough to call into question some confessions' reliability and validity in a court of law.

## False Memories

False memories are the difference between guilty and not guilty, reality and fabrication, what happened and what must have happened. False memories are episodic memories created by distortion, suggestion, and sometimes direct manipulation. Most research on false memories has focused on the effects of interrogation and intense counseling sessions. Individuals placed under pressure to recall details from ambiguous memories, or who are presented with strong evidence of an event occurring, may construct false memories that over time become increasingly believable.

How questions are asked can have a strong influence on the memories that are recalled. Strong suggestions or the tone of a question's wording may result in combining separate actual memories that were originally not associated and can even result in implanting completely false memories in an individual's mind. Individuals who have formed false memories are not intentionally lying or deceiving their audience; they truly believe that their memories are recollections of past events. However, there is evidence that individuals are sometimes purposefully deceived in order to facilitate the creation of false memories. False memories naturally occur through the reconstructive nature of memory in everyday life and are not limited to interrogation, experimental, and/or therapeutic settings.

### Creation of False Memories

Contrary to popular belief regarding the nature of memory, the creation of false memories is relatively simple. Studies by Elizabeth Loftus show that when asking questions, the accuracy of the answer and the resulting memory of the event can be strongly affected by the wording of the question. Changing as little as one word in a question can significantly alter the recall of events. Even changing the presupposition of the statement can create false memories. For example, when asking participants that had just watched a traffic video containing no stop sign, "Did you pass a stop sign," versus "Did you pass the stop sign?" memories varied. The participant who receives the question containing the word *the* is more likely to recall passing the stop sign. Additionally,

as time passes, the false memory became stronger and the participant became more confident that there was a stop sign. This occurs because the question implies a correct answer—that there was a stop sign.

Loftus's experiments have also shown that beyond the influence of question wording on memory, completely fabricated memories can be constructed through questioning and suggestion. These experiments start with an event that is known to not have happened and then present that event to the participant as if it were fact, such as a childhood memory. Examples of these implanted memories include having being lost in a shopping mall, being attacked by a wild animal, riding in a hot air balloon, or meeting Bugs Bunny at Disneyland. The participant not only believes that the event occurred, but as time goes on, vividly remembers the event in specific but inaccurate details. Although the events were presented as having happened, participants were never lost in a shopping mall, mauled by an animal, in a hot air balloon as a child, and did not meet Bugs Bunny at Disneyland. Regardless, once they had been convinced that their relatives remembered this happening to them, they would suddenly remember the events and fill in the details.

Memories of impossible events have also been studied using two experimental groups, a hypnotized group and a guided group. The participants in both groups were led to believe that they could remember events just days after they were born. Participants in both groups remembered things such as doctors, nurses, cribs, and hanging mobiles, with 49 percent of the participants believing that these memories were real and expressing confidence that they were accurate. Neurological studies are conclusive that such memories could not exist from this time period of development. Hypnosis was not needed to create false memories. Researchers have shown that wording and misinformation can easily create false memories in experimental settings. There is also ample evidence that false memories are often created during memory recovery therapy.

### **Memory Recovery Therapy**

Memory recovery therapy is controversial, and its critics suggest that all it does is create distorted

or false memories. Experimental investigation has found no increase in the accuracy or amount of information recalled about actual events when using memory recovery therapy. Practitioners using memory recovery therapy are likely to believe that they are serving their clients by helping them to recover lost real memories; however, controlled studies of memory recovery indicate that the creation of false memories is more likely. Clients have been reported to suddenly remember being sexually or physically abused as a child, partaking in satanic rituals, or participating in criminal acts.

Originally, memories recovered in this way were assumed to be real because they were vivid and detailed and the person was convinced the “recovered” memory was genuine. During the 1970s, an epidemic swept through the United States of adults who had attended memory recovery therapy and accused their parents of child sexual and physical abuse. As recovered memory therapy was more frequently used, the recovered memories became increasingly outrageous and more and more cases were found in which the memories could be proven impossible.

There have been several cases in which therapists have been found guilty of malpractice because of implanting provably false memories using recovered memory therapy, resulting in clients receiving monetary compensation. In one explicit case, a woman vividly “remembered” her father impregnating her and then aborting her fetus with a coat hanger; both events were not medically supported. The tragedy of false memories is that once created, they seem just as real and as hard to forget as real trauma.

The real test of memory recovery therapy is that implanting false memories is very easily achieved in experimental settings. Likewise, the presumption that memories can be easily repressed is not supported. Efforts to repress memories in laboratory settings have all failed. Additionally, those that are known to have suffered horrific traumas in real life do not report ever forgetting those experiences.

### **Eyewitness Testimony**

Eyewitness testimonies play a significant role in determining the guilt of those accused of crimes. Just as false childhood memories can be created,

false eyewitness testimonies can be created in a similar way. Questions and wording may mislead the witnesses into believing in false events. Not only can misinformation lead witnesses into recalling false information but there are other factors that can influence a witness's testimony, such as the presence of a weapon or other visual and auditory stimuli present during the crime. Depending on the witness, different aspects of the crime could be considered important. It is often difficult for an individual to successfully remember the entirety of an event while trying to remember both auditory and visual information. Therefore, the witness may put more effort into trying to focus on the perpetrator's appearance, rather than on what the perpetrator was saying during the crime. The visual and auditory stimuli can overlap and interfere with each other, resulting in false memories.

One study examined how accurately a witness recalled visual stimuli when hearing auditory stimuli with an accent. The researchers of this study found that, in fact, when the perpetrator had an accent, there were more errors found when remembering the perpetrator's appearance because the accent became the focus of the witness's perception. The witness focused more on trying to understand what the perpetrator was saying rather than focusing on visual stimuli, such as the appearance of the perpetrator or the presence of a weapon. After a witness has stated a memory once, each additional attempt at recall involves rebuilding their memory, including the information previously stated. This can cause information to become subtly distorted and result in the formation of false memories over time.

Memory recollection serves as a very powerful tool in many court case decisions. False memories can lead to false accusations, false trial outcomes, and false confessions. There have been several court cases in which an innocent individual has pled guilty because they were convinced by false memories that they had participated in the crime. Accused of sexually abusing his two daughters in 1988, Paul Ingram pleaded guilty to a crime of which he was not guilty because of the pressure that he received from his pastor, detectives, and his growing doubts of his memory. Soon after pleading guilty, his two daughters continued to recall events that became so farfetched that the

prosecutor no longer believed them and started to realize that all of the accusations were likely created from false memories. Unfortunately, it was too late for Ingram, who had already pled guilty to the previous false accusations.

Because of the frequency of false accusations, accused parents created the False Memory Foundation in 1992. The foundation is a support group for parents who have been falsely accused by their children because of false memories created during memory recovery therapy or through aggressive police interrogation techniques.

### Reality Versus Fabrication

It is nearly impossible for a person to differentiate between true and false memories once they are created and the individual accepts them as true. However, recent research on the differences between true and false memories has found differences in brain region activity. By examining the encoding phase of memory and then looking at the retrieval phase, researchers have found differences between real and false memories. True memories have been found to create activity in more regions of the brain than false memories. This difference in brain activity may be because of the actual processing of true memories. Higher amounts of activity are seen in the visual regions of the brain when studying true memories. In contrast, when looking at false memories, there is more brain activity in auditory regions of the brain. This suggests that the brain is processing what was actually seen in true memories, and the brain is processing the auditory misinformation it received to recreate false visual memories in false memories.

False memories can occur throughout everyday activities. The creation of false memories can be intentional or not, and they are often created through conversations with others, distortions of actual memories, recovered memory therapy, and intense interrogations. Experiments have found that false memories can be created from misinformation, misleading questions, changes in a question's wording, or the inability to focus on multiple senses during stressful events.

## False Signals

Social situations create an opportunity for individuals to deceive others. False signals, nonverbal and verbal, are meant to deceive, manipulate, or misdirect other(s) in a social situation. There is an abundance of uses for false signals: Businesses illegally manipulate their balance sheets to look financially better than they are, thereby increasing stock prices; disinformation is employed by military systems to misdirect enemy military forces; married couples may snuggle next to each other during the holidays when observed by extended family members, yet file divorce papers a few days later; and children can dramatically clutch their stomachs and moan in pain after being reminded that they have a test at school that morning. False signals are used in a variety of situations, from large scale to dyadic interaction.

### Nonverbal Signals

Nonverbal signals accepted by a cultural group to have a particular meaning can be readily used as false signals. In the overarching American culture, there are many institutionalized nonverbal signals: white-tipped canes designate a blind or visually impaired person, blue lights flashing on a car mean that it is a law enforcement vehicle, and the wearing of scrubs in a hospital indicates that the wearer is an employee. Exhibiting any of these institutionalized signals infers a particular

attached meaning. Thus, a person impersonating a police detective can display a false badge, which in turn will assist another to believe this imposture. False signals assist in deception, particularly when the signal has an accepted meaning.

The usefulness of false signals depends on their reliable meaning to all individuals involved. In other words, the individual displaying the false signal assumes that the other individual(s) will interpret the meaning in a specific manner. This is a fundamental aspect of false signals: The person attempting to deceive another via the use of a false signal(s) will choose a signal he or she assumes will be interpreted in a particular manner. Thus, when shifting from noninstitutionalized signals to other nonverbal signals it is imperative to choose signals that exhibit the meaning desired.

Nonverbal signals are interpreted in a variety of ways; a well-chosen false signal is readily understood in the manner meant to assist with deception. For example, a person wanting a friend to think that she is too sad to continue a conversation may let tears slide down her cheeks until the other ends the conversation; the con artist who wants a potential victim to think that he is infatuated with her may move closer on the sofa until he is resting his leg alongside hers from hip to knee; and the little sister who wants mommy to think that big brother hit her may sit right next to her brother and begin loudly screaming. All of these nonverbal signals are likely to be interpreted as the deceiver desired.

### False Signals Sent Near-Simultaneously

A technique frequently used to solidify the meaning of a false signal is to near-simultaneously send a variety of false signals that agree with each other. To illustrate, note the false signals could be added to the above examples: The sad person would let the tears flow, grab for a tissue, put their hands to their face, and mix hiccups into their attempts at conversation; the con artist might sit close, lean in to the victim, put his arm around her waist, and rest his hand on the curve of her waist; and while the child screams, she might begin to cry while pointing at her brother. In each example, a near-simultaneous multitude of false signals is displayed by the deceiver, all in an attempt to encourage a particular interpretation of the social situation.

*Katie Holmes may have been projecting a false signal of closeness to husband Tom Cruise at the White House Correspondents Dinner, May 9, 2009; she was becoming unhappy with their marriage, which soon unraveled. Cruise, taken aback when Holmes filed for divorce in 2012, stated, "I did not expect that."*

This latter technique of using a multitude of false signals near-simultaneously is particularly important when each of the nonverbal signals has multiple meanings, as do most nonverbal signals. For instance, a person could be cold, angry, or just comfortable folding their arms across their chest; a person could be naturally loud, wanting someone in another room to hear them, or upset when their voice rises; and a person could be a vigorous gesturer, energetic, or furious when their hands wildly gesticulate. None of these nonverbal signals on their own allow another person to interpret them in one particular manner.

However, if a person sends a near-simultaneous multitude of signals, the nonverbal signals that individually could be interpreted in different ways instead coalesce into a particular meaning. If a

man wants to pretend that he is angry, he could begin by folding his arms across his chest, and as the interaction progresses, raise his voice and start wildly gesticulating. Together, these false signals combine to exhibit anger or frustration. This particular near-simultaneous technique allows a variety of nonverbal signals to be employed as false signals; there is no longer any necessity for each nonverbal signal to individually have a particular meaning; instead, the meaning is derived from a combination of nonverbal signals.

Sociologist Erving Goffman discusses a similar concept in his book *Stigma*: disidentifiers. Typically a coherent picture of a person's stigma is created from a variety of interpreted signals. When one or more disidentifiers—or false signals—are intermixed with truthful signals, it is difficult to develop a coherent picture of a person's stigma. People devalue individuals deemed to be stigmatized, thus Goffman claims that many people will attempt to pass as normal, that is, the term he uses to mean not stigmatized. Disidentifiers are one particular technique that individuals use to pass as normal. Thus, a blind person may wear a pair of attractive reading glasses or carry a popular pocket book; blind people do not visually read, so wearing distinctive reading glasses or carrying a printed book places disidentifiers into the mixture of signals that people interpret, making it more difficult to perceive the person as blind. Disidentifiers misdirect individuals from interpreting truthful signals.

### Verbal False Signals

A person can use verbal messages in addition to nonverbal signals. Claiming to be a single person when married, wealthy when poor, or a cat lover when one is not are all examples of verbal false signals. The key when using verbal false signals is similar to that of using nonverbal false signals: The signals should agree with each other, and with both the other verbal and nonverbal signals in the situation. Thus, the person claiming to be single needs to be without a wedding ring or a tan line from a wedding ring, and they shouldn't have an entry in their cell phone that says wife or husband. A woman who claims to be a cat lover, and during an interview for a house-sitting position never pets the cat rubbing against her legs, is sending mixed signals; her words say that she

loves cats but her lack of attention to the pet calling for her attention sends a contrary message. A coherent picture of a pet lover cannot be formed because the near-simultaneous signals fail to agree. Additionally, when verbal and nonverbal signals disagree, most individuals rely on nonverbal signals; there is no scientific evidence to support that nonverbal signals are more truthful than verbal signals, but there is research exhibiting individuals' perceptions of nonverbal signals as having more validity.

Thus, false signals are one of the many techniques used to deceive people with the ultimate goal of misleading, misdirection, deception, or manipulation. The consummate communicator orchestrates with precision a multitude of false signals to create coherent meaning, and in this instance, a meaning representing something other than truthfulness.

sustaining an overactive imagination into adulthood—has been identified as the prime meridian from which numerous forms of deviance and delinquency stem; this includes the lying acumen and aptitude for deception necessary for a classification of psychopathy.

While a formal clinical or medical diagnosis of psychopathy cannot officially be made, it is a general classification often included in, or found to accompany, any number of contemporaneous personality or mental disorders. Most frequently, these disorders include elements of psychopathy such as antisocial personality disorder and narcissistic personality disorder, as outlined in the *Diagnostic and Statistical Manual of Mental Disorders* (5th ed.). Psychopathy, which frequently includes these or other underlying disorders, is then generally characterized by conning, manipulative, and egocentric behavior, and is most frequently associated with predatory offenses of a compulsive or cyclical nature that reinforce an offender's need for control, including serial homicide and serial rape.

Building on this typology, Canadian psychologist Dr. Robert Hare, in developing his Hare psychopath checklist, revised (PCL-R), established a menu of 20 characteristics traversing four behavioral facets, from which a numerical score could be used to classify a subject as fitting within a spectrum of psychopathy. With a maximum score of 40, the PCL-R examines key personality traits and lifestyle patterns for evidence of psychopathy, and in theory, enables the forecasting of criminal activity based on the tabulated results. As a type of Myers-Briggs test for deviants, the PCL-R was developed from American psychologist Hervey Cleckley's Cleckley checklist, an index of 16 common characteristics of psychopaths, first published in 1941. Since the 1990s, however, Hare's checklist has prevailed as the leading method used for assessing psychopathy in institutional settings, such as prisons and psychiatric facilities.

Both the Cleckley and Hare checklists include, among other traits such as criminal versatility and habitual lying, categories specifically relating to grandiose self-imagery and being consumed by unrealistic, adolescent fantasies of power or control at the expense of realistic long-term goals. Further research, including interviews with criminal psychopaths studied during the development

## Fantasy and Imagination

Fantasy and imagination play an integral role in childhood social and neural development, and to some extent serve a person's interests across the life course, inspiring everything from research and innovation to the creation and cultivation of art and culture. However, fantasy run amuck—and

of the FBI's Mind Hunter Program (now the Behavioral Science Unit) that was developed during the 1980s by nascent profilers applying Cleckley and Hare's methods, as well as new academics working in what was fast becoming an interdisciplinary area, identified the development of and preoccupation with fantasy as the tipping point that turned conventional psychopaths into violent serial predators. It was determined—using case studies like Ted Bundy, who convincingly camouflaged his sadistic and murderous tendencies with a manufactured exterior persona—that lying and fantasy were mutually inclusive in the case of the most well-developed, and by extension the most dangerous, psychopaths.

While control-based fantasies need not always be accompanied by psychopathic behavior, nearly all cases of psychopathy involve some cultivation of fantasy or imagined relationships to people or places that eventually lead to harm. Lying and rehearsed deception are in turn the means by which the psychopath develops a social mask, and the means by which they conceal the dangerous nature of their fantasies and need to exert control and humiliate others. This explains in part why psychopaths make poor candidates for polygraph examinations, in that their baseline stress responses to lying are negligible, or in some cases are altogether absent because lying becomes a routine activity and a necessary mechanism to sustain their duplicitous identity.

With lying and deception as veritable survival skills of the psychopath, the fantasies of serial offenders typically go beyond mere imagination and mental rehearsal, and eventually take the form of what are known as paraphilia, or a type of prosthetic fantasy tied to bizarre sexual fetishes and objects, as well as nonconsenting participants. While the initial fantasies may or may not be overtly sexual in nature (e.g., of power, admiration, domination, fear, and respect), the paraphilic extensions and implications of those fantasies tend to take on a harmful sexual dimension once the psychopath acts on a particular fantasy—or begins to develop new ones. Common examples of paraphilia include preparatory paraphilia such as exhibitionism, voyeurism, or somnophilia, during which time the subject escalates behavior and intensifies the fantasy. Attack paraphilia include sadism, pyromania, or necrophilia, where

the subject brings the fantasy to climax through the cause of harm to someone or something.

### Dennis Rader

One of the most effective illustrations of the lying-fantasy-paraphilia triad in recent years, and one that underscored the role of the deviant imagination in inspiring serial offending, was that of Dennis Rader, the self-proclaimed Bind, Torture, Kill Strangler. Maintaining the façade of a family man, Lutheran church president, Boy Scout leader, and municipal bylaw enforcement officer, Rader's life was a contradiction, pervaded by snowballing lies as he sought to conceal his various paraphilia, acting them out through the murders of 10 people around Wichita, Kansas, between 1974 and 1991. As a city bureaucrat and community volunteer in his public life, and an elusive serial killer in his private life, Rader protracted his murderous fantasies and life of deception by sending taunting letters to the police and media, apparently inspired by the Zodiac killer who was active in California just prior to the time of Rader's first murders. After Rader's letter-writing scheme and need for attention eventually resulted in his arrest for the killings in 2005, he confessed to all 10 murders (which he dubbed "projects"), citing that in at least one 1977 attack, he admitted to the female victim before tying her up and strangling her that he had a problem in controlling his fantasies, and that he was required to act on them at her expense. In Rader's case, as with many criminal psychopaths, his victims were the only people with whom he was able, or at least willing, to be truthful.

Today, in a digital age defined by indulgence in fantasy, and where projecting an unrealistic and misleading persona is tied to establishing and maintaining social capital, the practice of clinging to malignant fantasies emblematic of psychopathy has become strangely tolerated. The nexus between social media, deception, and psychopathy is actually fairly straightforward, with considerable research already found on lying, conning, and paraphilia in the context of Internet dating and luring, but with little attention thus far paid to the intersection of social media, fantasy, and paraphilia.

As with the exaggerated or outright fabricated online profiles used in the early days of the

Internet, the current World Wide Web and its array of open-source and interactive platforms is ripe for the type of engineered public persona that defines the psychopath, in part because it presents a space where suitable guardianship is comparatively lacking, and where fantasy and imagination, however twisted or injurious, can be explored and experimented with through the anonymity of an imagined or fictitious persona. Identified paraphilia connected to devious fantasy development, such as Internet trolling and cyberbullying as digital forms of scatologia (the sending of insulting, harassing, or obscene communications in order to elicit a response), and the compulsive viewership of profiles or “creeping” as a digital version of both voyeurism and erotomania (sexual obsession with strangers as a precursor to stalking), complement everyday examples of fantasy achieved through the generally narcissistic and exhibitionistic architecture of social media.

### John Edward Robinson

Using the screen name Slavemaster when luring victims via Internet chat rooms during the early days of Web 1.0, John Edward Robinson epitomizes the means by which digital technologies can be exploited by paraphilic predators whose lying and deception had previously found comparatively benign outlets. As a seasoned con man, forger, fraudster, and professional liar, Robinson misrepresented his financial status, education, and occupation to gain the trust of victims looking for discreet online personal encounters, eventually becoming known as the Internet’s first serial killer. Having already obtained valuables and employment by artifice, Internet chat rooms as nascent social media sites afforded Robinson the opportunity to expand on his lies, and in turn, to act on criminal paraphilia that had been festering for some time, but lacked a conduit.

Taking what he learned from years of embezzling investors with Ponzi schemes and fraudulent shell companies, Robinson—whose significant criminal record showed no previous indications of violence—used his same manipulative tricks, honed through various financial scams, to procure a new type of victim in a bid for fantasy fulfillment. After victims arrived at his secluded farm expecting a job opportunity or a prearranged intimate encounter, Robinson tortured and beat

to death at least eight women between 1993 and 2000, before then stuffing their bodies into steel drums he stored across state lines. Following his conviction for three of these murders in 2003, Robinson confirmed that there were additional victims waiting to be found, but continued to indulge his fantasies from death row, reveling in ongoing attention by toying with authorities and victims’ families while refusing to divulge further details or locations of the bodies.

The Robinson case is noteworthy in terms of the slippery slope that virtual technologies present with respect to fantasy fulfillment among psychopaths, whose paraphilia had previously remained latent or idling in the preparatory phase. In examining crime records dating back to 1800, not only have over 96 percent of recorded serial killers like Robinson emerged in the United States and Canada since 1990, but the numbers also seem to be compounding. In fact, there have been more identified and arrested serial killers in the last 10 years than in the previous 25; this, in spite of the fact that the overall murder rate in both Canada and the United States is at a generational low.

The role of technological determinism—the influence of technology on human behavior and culture, and its ability to dictate events—is a significant factor in this unsettling trend. As in Robinson’s case, technology seems to parlay an existing aptitude for deception, and allows psychopaths to tap into deeper-seated and otherwise suppressed violent fantasies with extreme consequences that transcend the virtual world of the Internet. The convergence of social media and paraphilia in particular warrants additional scholarly exploration, and is bound to become an increasing area of saliency in the study of how degenerate fantasy-control impulses are enabled by the transparently deceptive nature of online social networks.

## Federal Trade Commission

The Federal Trade Commission (FTC) had its beginnings in 1903 as the Bureau of Corporations, established by President Theodore Roosevelt. The Clayton Antitrust Act officially established the FTC in 1914 in response to the increasing number of monopolies in the U.S. economy. It was not until 1938 that the FTC's authority expanded beyond antitrust efforts to include "unfair and deceptive acts or practices" in business and advertising. The FTC's authority further expanded in 1975 to include creation and enforcement of across-the-board trade regulations for industry segments.

A five-member commission heads the FTC. The president appoints commissioners for a seven-year term, following approval by the U.S. Senate. No more than three members of the commission may be from the same political party. The president selects a chairperson from the commission's five members. The chairperson appoints the executive director, who must then be confirmed by commission members. The executive director is responsible for the day-to-day operations of the FTC. There are three bureaus within the FTC: the Bureau of Consumer Protection, the Bureau of Competition, and the Bureau of Economics.

The public is most visibly affected by the Bureau of Consumer Protection, which oversees the FTC's consumer fraud and detection efforts. The Federal Trade Commission Act established the commission's authority over false advertising.

### False Advertising

The act defines deceptive advertising as "misleading in a material respect," which means that the average consumer would be misled by the advertising. The definition does not include all misconceptions that a person could have about an advertisement. For example, it is not deceptive to call a breakfast item "French toast," even though the toast was not made in France. The number of individuals who would be misled by the use of this phrase would be insignificant compared with the masses who understand that "French toast" does not mean the toast was made in France. Unreasonable interpretations by a small segment of the audience do not cause the ad to be considered "deceptive" by the FTC. It is when there is more than one meaning expressed to "reasonable" customers that are untrue that the advertisement can be deemed misleading.

Not only can ads be deceptive for what they say, but they can also be deceptive for what they omit. Failure to disclose salient information required by the average consumer can also be considered "deceptive." Omission cases are handled in a similar manner to cases involving stated deception. The standard of a "typical buyer" is used by the FTC and the federal courts to decide if the lack of disclosure was misleading.

The U.S. Supreme Court in 1977 upheld the FTC's authority to protect special audiences, such as children, older adults, and terminally ill patients. These subgroups may receive special consideration in fraud cases. The FTC uses the standard of the sophistication level of the audience in determining if advertising practices are fraudulent. Likewise, the standard for determining deception is lower if the audience has specialized knowledge, as in the case of medical professionals exposed to pharmaceutical advertising.

### FTC Action in Deception Cases

Deception cases brought before the FTC generally have three common elements. The first is a depiction, omission, or act that will likely mislead most

buyers. Some examples of this are deceptive price claims, bait-and-switch techniques, unsatisfied warranty claims, sales of hazardous or defective products, and misleading pyramid schemes. Most of these types of deceptions or omissions involve either written or oral falsifications. However, sales activities or practices are also taken into consideration by the FTC if they mislead consumers. Failing to provide services specified within a contract can also be considered deceptive.

The second element is the reasonability of the claim or sales activity through the eyes of an average consumer. If the average person would find the action or communication misleading, then the activity or advertisement would be considered deceptive by the FTC.

The third element is “materiality,” which means that the false practice or advertising significantly influenced the consumer’s purchase decision. If the consumer’s belief in the misrepresentation in turn brought some type of injury or loss, then the FTC considers the conduct or communication to be misleading or untruthful.

One aspect of materiality that has been a focus of the commission is substantiation of advertising claims. If ads make claims such as “studies show” or “doctors recommend,” the business entity is required to have validation of the claim prior to advertising. If that claim is found to be untrue and had a significant impact on consumers’ purchasing decisions, the FTC can seek penalties for the unsupported or untruthful advertising claim.

The FTC considers ads in their entirety to determine whether deception occurred. For example, if the headline of an ad is deceptive, but the truth is included in the fine print, then the FTC would consider the ad misleading because the average person would likely read the headline and not the fine print. Disclaimers may not protect companies from deceptive advertising claims. Expressed opinions can also be considered misleading if the qualifications of the person stating the opinion are misrepresented, causing the buyer to be influenced or consider the opinion to be fact.

The commission can issue cease-and-desist orders until such matters can be resolved through the judicial system; however, the accused has 60 days before the cease-and-desist order takes

effect. As a result, injunctions are typically filed through the court system because these become effective upon issuance. Because the commission lacks punitive powers, the FTC brings civil charges against offending businesses and industries, and it is up to the federal courts to assess the recommended penalties.

Punishments for violating truth in advertising regulations can be stiff. Google paid \$22.5 million in 2012 for placing cookies in the Apple Safari browser. Google previously said that it would not place tracking cookies in the Safari browser, nor would it place targeted ads for users. Scareware Scammer was hit with a \$163 million fine for fake software ads that it ran on the World Wide Web from 2000 to 2008.

In addition to its responsibility to police truth in advertising, the commission has the authority to issue industry-wide regulations. Some recent examples of this rule-making authority include the Do-Not-Call Implementation Act of 2003, which allowed consumers to take themselves off telemarketing call lists, and the Children’s Online Privacy Protection Act (COPPA) of 1998, which prevented collection of personal information from children.

### Technology and the FTC

Technology changes the purview of the FTC. While once primarily interested in advertising, the FTC is now involved in online privacy issues, identity theft, robocalls, and Internet auction scams. Technology is also helping the FTC’s law enforcement efforts. The FTC operates the Consumer Sentinel, which is an online database available to more than 2,000 law enforcement agencies. This database provides information that helps local and state officials assist with finding individuals involved in fraudulent consumer activities.

## Feigned Retreat

Feigned retreat is a strategic form of deception implemented as a tactic in military warfare. The enemy is manipulated to believe that the army is retreating, when in fact the enemy is being led into a more vulnerable position that allows the army to gain a competitive advantage. This military tactic has been employed as long as war conflicts have been recorded and is considered a complex method with high risk, as it entails a large number of disciplined soldiers to make the retreat appear genuine. Feigned retreat is an effective strategy that has played a role in the defeat of many empires and armies throughout history.

In Homer’s story *The Iliad* the Greeks were in a 10-year stalemate with the Trojans during the Trojan War (between 1260 and 1240 B.C.E.). To get behind Troy’s city walls, the Greeks constructed a large wooden horse, hid select men inside of it, and presented the gift to the Trojans while pretending to sail away and abandon the siege. This “peace offering” led the Trojans to believe the war was over. However, the Greek soldiers hiding within the horse opened the gate and finally were able to penetrate the indestructible walls of Troy to put an end to the war.

### Famous Battles Using Feigned Retreat

In the Battle of Thermopylae (480 B.C.E.), the Persian Empire of Xerxes I attempted to invade

Greece, but the Greek city-states formed an alliance, led by King Leonidas of Sparta, to stop the army. The Greek army, composed of 300 Spartans, 700 Thespians, and 400 Thebans, blocked the pass of Thermopylae from the Persian advance. The Spartans used the tactic of feigned retreat during the first day of the battle to break their formation and then turn and kill their pursuers.

The Roman defeat by Hannibal at the Battle of Cannae (216 B.C.E.) is considered one of the greatest tactical feats in military history. The Roman army was composed of over 86,000 soldiers, while the Carthaginian army had roughly 40,000. During the battle, Hannibal remained in the center of his forces, where the strength of the army was the weakest. As the Roman army attacked, the infantry retreated. As it retreated, the Roman army slowly found itself positioned in a tight semicircle. The Roman troops in the front line chased the retreating troops, causing the troops in the middle to be pinched in. This pinching action reduced the space for the Roman troops to maneuver their weapons. Eventually the troops lost cohesion as the gap narrowed.

Although the Roman infantry was in a vulnerable position, Hannibal defeated the Romans by ordering the cavalry to attack at the rear. It is one of the earliest instances of a popular military strategy called the pincer movement. Feigned retreat is the fundamental tactic used in order for the pincer movement to work. The battle resulted in Hannibal’s victory and is one of the greatest defeats of the Roman army. To this day, the strategy represents the archetypal battle of annihilation.

The Mongolian empire, under Genghis Khan, frequently feigned retreat to conquer nearly all of Asia, the Middle East, and parts of eastern Europe. Most often during a battle the Mongols would pretend to panic and run away to draw the enemy out, only to turn around and attack. Eventually, frequent enemies of the Mongols learned this strategy. The Mongolians countered this by feigning retreat for days, even weeks, in order to convince the enemy that they were defeated. Once the enemy let its guard down or broke formation, the Mongols would then attack the weakened army.

The Battle of Kalka River (1223), between the Mongol Empire and the Rus’ army and its allies, is one noteworthy example of Mongolian

*The Bayeux Tapestry, thought to be commissioned in the 1070s by Bishop Odo of Bayeux, half-brother of William the Conqueror, depicts Norman knights and archers at the Battle of Hastings. During William the Conqueror's attack on the English in 1066, his army became overwhelmed and retreated down the hill. After being chased by the enemy, however, William was able to rally his troops and engage in a successful counterattack. As the retreat was unintentional, there are scholarly disagreements over whether it was truly a feigned retreat.*

fighting strategy. The Rus' army initially defeated the Mongol rearguard and the Mongols began to retreat. The Rus' pursued the Mongols, forcing their army to spread out over a large distance. Simultaneously, the Mongols made their formation at the Kalka River. The Rus' army did not wait for the rest of its troops to arrive and, as a result, was defeated. This caused confusion for the rest of the Rus's army and resulted in its surrender.

In rare cases, feigned retreat may occur accidentally. One such example is the Battle of Hastings (1066), which occurred during the Norman conquest of England. William the Conqueror was attacking the English, but the English had an advantageous position at the top of a hill and a shield wall that William's army was unable to penetrate. When victory seemed unlikely, the Breton division of William's army broke off and started fleeing down the hill. After the Breton division retreated, his Norman and Flemish divisions followed. The English chased the fleeing army, slaughtering as they went. During this time, William's horse was killed and many of his soldiers thought he had died, leading to an even greater

rout within the army. William took off his helmet to show his troops he was still alive and was able to rally the fleeing troops. The English, who were chasing after the army, broke their formation and did not realize they were in a counter-attack until it was too late. The battle turned to William's advantage, and he was able to achieve victory. It is arguable as to whether the feigned retreat was intentional or not. If intentional, the Normans successfully used feigned deception as a tactic to break the English formation. If it was unintentional, then the retreat was not feigned but accomplished the same effect given William's ability to rally his troops.

Feigned retreat relies on misleading an opposing army into falsely believing that the other army is retreating. The tactic of feigned retreat has a long history, from some of the earliest recorded battles, and continues to be deployed in modern warfare.

## Fiction

Any imaginative tale that is composed of characters working their way through circumstances and events is a fiction; therefore, a fiction can be a lie, an observation that is in keeping with the term's derivation from French and Latin precursors whose meaning is closer to lying. Nevertheless, current use of the term *fiction* is more commonly associated with storytelling for entertainment; thus, bookstores abound with fiction and nonfiction.

The creation of fiction in this sense is not lying, because such stories are contextualized by signals of a sort described by George Herbert Mead, signals that indicate this is play and that the story being told is one that only exists in imaginative space for the sake of pleasure. Whenever an untruth is marked untrue in its telling, even if only through contextualizing actions and gestures (for example, by tickling the listener or winking while telling the tale), it is regarded by the receiver as an entertaining imaginative pleasure, not as a lie.

Nevertheless, the expression "pure fiction" may be used when characterizing a lie, and various stories told as true ultimately come to be regarded as elaborately framed misrepresentations or obfuscations of the truth, in effect lies. Robert Coles, for example, makes clear that Erik Erikson grew up under the fiction that Theodor Homburger was his father. Similarly, the Warren

Commission report, "Report of the President's Commission on the Assassination of President Kennedy," has been regarded as a fiction by many who claim the assassination was a conspiracy. Characterizing such reports as fictions (instead of saying "lies") minimizes the defamation of the accusation while nevertheless asserting the existence of a deliberate inaccuracy.

It is uncommon and usually colloquial to refer to an isolated statement (for example, "The door is locked") as a fiction, although this usage may be appropriate if the statement referenced clearly sits within a more complex narrative, particularly if that narrative is literary (for example, "Orson Welles's radio announcement that Martians had landed in upstate New York was a fiction"). In any case, a fiction is not regularly, and certainly not exclusively, regarded as a lie.

### Forms and Values of Literary Fiction

Fiction is a term that loosely describes, then, that class of stories both imagined and invented outside the constraints of historical accuracy. While actual events may play roles in a fiction, as for example World War II plays a role in *The Danzig Trilogy* by Günter Grass, the primary tale in a fiction remains, necessarily, an invention. Thus, every made-up tale is a fiction; therefore, when one says that a tale is a fiction one hardly says anything at all. It is for this reason that, while the term *fiction* suffers this common usage, a more precise usage tends to exist within literary studies, in which fictions are discussed as if they are distinct from: (1) mythological inventions (for example, "Demeter and Persephone"), because they have not risen to archetypal status within the culture; (2) folk legends and fairy tales (for example, "King Arthur and His Knights" and "The Frog Prince"), because they did not participate in centuries of oral retellings broadly distributed across a culture; and (3) classics (for example, *Don Quixote*), because they have not been assigned a place among the masterpieces of human history.

Myths, legends, fairy tales, and classics could all be called fictions, just as mink coats, overalls, and a Santa Claus costume can all be called clothing. No tailor would fail to see the differences in type, however, nor would any avid reader fail to recognize the realms of fiction.

For this reason, the term *fiction* regularly finds itself attached to some significantly defining adjective, which provides a sense of whether one is looking at the works of a great and senior contemporary, such as Gabriel García Márquez, or the rambling, narrative vagaries of an eighth-grade student completing an English assignment. On occasion, therefore, a work of fiction may be referred to as “published fiction” or even a “magisterial work of fiction.” Another fiction may be characterized as pulp, as vulgar, or even pornographic. Still another might be characterized as masterful, a masterpiece, a soon-to-be classic. In all such cases, it remains fiction; yet it finds itself distinguished from the shredded leavings of half-wrought stories and homework assignments. An author thus manages to surpass the platitude that he has written a fiction when the work achieves “escape velocity,” that is, when it gathers a literary character and a literary force significant enough to break the gravitational pull of insignificance and historical irrelevance that attends the word *fiction* when it is used to identify the very bottom of the tale.

The exemplary critic Northrop Frye, who enjoyed and studied all forms of storytelling, offers time as the natural force that determines the value of a text; effectively, his claim is a comment regarding the erasability of a written work. Has, will, or can the work be eliminated from the literary canon without consequence? Consider, for example, the remarkable popularity of novelists such as Irwin Stone, Irving Wallace, and Herman Wouk during the mid-20th century. Will these authors persist in the fashion of Thomas Hardy, Charles Dickens, and Jane Austen in England; of Fyodor Dostoevsky, Leo Tolstoy, and Nikolai Gogol in Russia; of 19th-century writers Herman Melville, Nathaniel Hawthorne, and Edgar Allan Poe in the United States, or their 20th-century American successors John Steinbeck, F. Scott Fitzgerald, and William Faulkner? It takes no clairvoyant to answer; these authors’ erasure is more than noticeable already.

Yet if disappearance in time is the phenomenon that gainsays a fiction’s mediocrity, then one has not discovered an explanation, merely a tautological assemblage. To further explore the erasability of literary fiction it is useful to examine the idea of latitudinarianism as described

and named by Kenneth Burke. A neologism best remembered as something to be forgotten, the term can, nevertheless, draw attention to the “stretchable”—the observation that words and phrases meaning one thing are inevitably stretched until they stand for something else altogether. Burke saw this in language, in morals, and in literary forms, and to that end he himself wrote elongated fiction of a sort—a fiction so experimental, so innovative, as to be virtually unreadable and unforgivably boring. A work of fiction reaches escape velocity only when it is vibrantly elastic, and while some fiction exercises some stretching upon the nature of storytelling, fiction should, in principle, do so in a manner that makes the experience of reading a better one, rather than a worse.

### Stretching Fiction

Fiction may be formally, structurally, normatively, or morally stretched. When it is formally stretched, the author struggles to surpass the literary customs associated with storytelling. Compare for example the classical opening, “Once upon a time” with James Joyce’s opening for *Finnegan’s Wake*: “riverrun, past Eve and Adam’s,” a phrase that is needed to complete the last sentence of the book. Edgar Allan Poe also stretches the formal character of “The Tell-Tale Heart” by employing a madman as narrator, and Anna Sewall achieves a similar effect in *Black Beauty* by telling the tale through the eyes of a horse. In these formal stretches by virtue of narrative voice, one can see the evolution of new conventions; a tale told by a chicken will hardly cause a stir at this point in the development of literary form.

When a work is structurally stretched, the conventional logic of tale-telling is surpassed. One can see this sort of stretching in *A Christmas Carol* by Charles Dickens, in which the structural conventions of beginning, middle, and end are challenged because Scrooge is conveyed, in a single evening, through all the times in his life, across events that have already transpired. Effectively an exercise in memory as sense-making, *A Christmas Carol* thus transcends the structural conventions of plot. These conventions point in the direction of Marcel Proust’s *Remembrance of Things Past*, which replaces the chronological ordering of events, starting at the immediate,

with a retroactive synthesizing of memories into a totality of meaning. This method of storytelling is used to perfection, because of the economy of language, by Ernest Hemingway in his eclectic debut volume, *In Our Time*. In Hemingway, the seemingly disjointed passages and stories fall into a singularity when they are positioned through the moments of consciousness experienced by Nick as he fishes at the very end of the collection. Such stretching of structural conventions replaces the traditional pleasure of wondering what happens next with the pleasure of wondering how the various recollected experiences might be synthesized into a singularity of meaning.

When a work is normatively stretched, typical behavioral expectations organizing popular fiction are characteristically abandoned. This is the strategy of Tom Robbins (*Even Cowgirls Get the Blues*), John Irving (*The Hotel New Hampshire*), and J. D. Salinger (*Franny and Zooey*). Characters in such works are typified in ways that make it harder to identify with them (for example, Meursault in *The Stranger* by Albert Camus); they have objectives that audiences do not regard as typical (for example, the narrator's intent in Poe's "The Tell-Tale Heart" to kill the old man because he had an "evil eye"). The story may move to an ending that audiences would not anticipate as desirous. For example, the crushing of Anna's head in Tolstoy's novel *Anna Karenina* or Raskolnikov's choice of prison as the context for his freedom in Dostoevsky's *Crime and Punishment*. Authors who would successfully stretch audiences toward such innovations must reach deeply within the fiction, beneath its surface character, and into the motivational apparatus that informs their work.

Thus, while Hemingway's *The Old Man and the Sea* seems to be about nothing more than catching a big fish, it is propelled by the quasi-Hegelian idea that the human spirit yearns to transform its essential and invisible truth into an object that others are compelled to acknowledge. The old man, Santiago, is driven to show the world what he is beneath the surface of his narrow and impoverished life, where dwells his implacable will. This is initially suggested when he recalls his all-night, arm-wrestling contest; but it is lived most fully in his struggle to catch and

bring home the largest marlin ever seen. Here, the reader is to identify with an aspect of human nature much deeper than the norms associated with fish and fishing—the impulse to form and to show to the world, from the realm of one's spirit, an objective correlative for what one is, in a work of art.

When a work is morally stretched, the moral logic of tale-telling is, to use Friedrich Nietzsche's term, *transvalued*, an objective commonly thought realized in the more recent Disney productions, which have struggled to appear racially and ethnically diverse. Diversity now being a convention, however, one might better refer to the novels of Thomas Hardy, which in their time issued such powerful challenges to the mores that he had to stop writing them, at his wife's request, lest the couple be completely excommunicated from society. Joris-Karl Huysmans, the French novelist of the late 19th century, can also be cited as an author who challenged conventions; his novel *Against the Grain* treated the issue of homoeroticism.

Whenever a work is stretched effectively, the innovation is not a burden; rather it increases audience pleasure, a notion that is critical to any understanding of escape velocity within the work. Vibrant elasticity is grounded in the notion that all the formal, structural, normative, and moral characteristics of literature can suffer the effect of saturation. Should that occur, the work no longer stimulates the imagination because the expectations specific to the narrative fall short of the audience's ability to anticipate them.

The principle is a simple yet critical one. At the age of 4, everyone appreciates "Ba Ba Black Sheep," but not so much at age 7, and certainly not at 17; while this illustrates only the relationship between standards as they change during the individual's development, it can equally be said of standards and the way they change as a culture develops. Vibrant elasticity gives to fiction its ever-renewing vitality and, to the individual works, the rationale for ascension.

A work of fiction that makes no effort to vitally stretch the possibilities of fiction is quite easy to write because it traffics in conventions that organize the process. A writer of conventional fiction cruises the highway of conventional literary logic; a writer of vibrantly elastic

fiction builds his or her own road. In any case, this is why liars can so easily make up fictions to cover their trails; their fictions are not concerned with the entertainment value of the story, and they only focus on narrative logic to the extent it will give them advantage in their relational context, making their fictions elementary in terms of innovation and structure.

One should not be impressed by a talent for such fictions, therefore, as it is a narrow one; the formal, structural, normative, and moral characteristics of mere fiction are as elementary, in their own fashion, as the regulations governing trivial rhyme. Literary fiction has an elaborate nature in which the author is serious, and it takes time to create. Mere fiction flows forth as little more than a juxtaposition of conventions; the tale, in effect, tells itself in its interminable repeatability. While it may delight its audiences because its conventions fit perfectly the conventions that they live, there is little else to recommend it.

Of course, there are exceptions. A person of romantic sensibility, for example, such as the young woman in Saki's "The Open Window" may delight in the literary weaving of a lie, and therefore craft it with delicacy. There are also remarkable fabrications, untruths of intricate complexity because they have been made up by collectives and across time. The various stories characterizing the death of John F. Kennedy are largely fictions of this sort. One of the stories, possibly the official story, might be regarded as the real story, but the rest, complex and innovative and shaped across the decades by numerous imaginations, are fictions so powerful that they have been, in some cases, put to paper or the screen.

### Role of Lying in Fiction

Lying itself can play a role in the content of a fictional work. For example, given that morality tales are common in fiction, the tale of the liar is one that is well known even to the youngest child who has been told the story of Chicken Little. The Sherwood Anderson short story "I'm a Fool" is an exemplary work of fiction in this form, being about a boy whose fortunes are ruined when he starts a relationship with others by lying. Similarly, Kurt Vonnegut's novel *Mother Night* traces the deceptions given and received by Howard W. Campbell, Jr., in a

manner that valorizes the moral claim that a life of lies leads to spiritual death.

Aside from morality tales organized around lying as a thematic center, there are countless liars in fictional works. Tellers of lies and deceivers include, for example, the comparatively benign and certainly lovable Tom Sawyer of the Mark Twain novels, the Machiavellian Wickham of Austen's *Pride and Prejudice*, and the slithering Uriah Heep of Dickens's *David Copperfield*. Among those deceptions specific to fiction are included deceptions of identity (for example, the pauper who acts as a prince in Twain's *The Prince and the Pauper*), deceptions of allegiance (for example, Iago creating the deception that he is an ally to Othello in William Shakespeare's play of that name), deceptions of intention (the Princess in the Brothers Grimm's "The Frog Prince" lying about her intention to love and care for the frog if he retrieves her golden ball from the well), and deceptions of attitude (for example, Uriah Heep's deception that he was humble and cared only to give good service, as presented in *David Copperfield*).

### Lying, Deception, and Plot Structure

Whereas plot typically relies upon the tension of irresolution, it needs structural features that drive apart characters and outcomes that "naturally" belong together. Misunderstanding of many forms can do this, but the lie and deception are exemplary because they arise out of forces of wickedness (as opposed to accident) within the text, theoretically increasing the yearning for resolution within the audience.

While it is impossible to offer a complete theory of fiction and the lie here, the elementary structure works as follows: (1) Characters and events are presented as they traverse a path that seems natural to them; (2) a deceiver or a liar creates falsehoods that shift these characters from the motivations of their primary path; (3) the characters travel along these improper paths, further driven into unnaturalness by misunderstanding, complications, additional deceptions, and lies; (4) the false pathway they have been set upon approaches a crisis, after which the natural pathway will no longer be available; (5) the deception that initiated the false pathway is discovered; (6) the characters retrace the

erroneous logic (including the discursive and generally performative corruptions) that have led them to their untenable positions and false destinies; (7) the characters reclaim their proper destinies through narrative processes that are specific to the genre; and (8) the wicked are punished and the good triumph.

Comedy and romance typically have this sort of ordering. In tragedy and irony, by contrast, events proceed of a piece up through the fourth stage, after which the deception, though it is discovered, brings on ruin (as exemplified by Shakespeare's characters King Lear, MacBeth, Hamlet, Romeo, and Juliet). Variants of this model can be found in stories ranging from those recorded by the Brothers Grimm to the novels of Cormac McCarthy.

Performative deception may also be used in a comedy of misunderstanding, as it was in the

18th-century Oliver Goldsmith play *She Stoops to Conquer*. Subversion as a literary innovation and delight has also led to the triumph of the lie and the liar as an ordering possibility in fictional form; Keyser Söze in *The Usual Suspects* and Mark Bellison in *The Invention of Lying* are cinematic examples of such characters. However, even children are taught the occasional necessity of deception (for example, The Wizard in *The Wizard of Oz*), as well as the lovability of the liar (for example, *Pinocchio*), and the fun that comes from being with a liar (e.g., *Pippi Longstocking*). The triumph of the lie was emblematic in the *Seinfeld* television series.

Fictions may be told within fictions, as was the classic story of Pyramus and Thisbe retold in comedic form within Shakespeare's *A Midsummer Night's Dream*. In this light, one thinks of

The painting *Ask Me No More* (1906) by Sir Lawrence Alma-Tadema depicts Pyramus and Thisbe of Shakespeare's *A Midsummer Night's Dream*. The nested story of the two tragic lovers is a fiction within a fiction, told in comedic form within the play. Shakespeare achieves the effect of confusing merely outward appearance and reality by constructing characters that use disguises to hide their true motivations from each other and the observer.

course of Hamlet's play within a play, and the famous lines, "The play's the thing with which I'll catch the conscience of the king."

## Financial Markets

Deception in financial markets involves the practice of influencing asset prices and bringing unfair market gains to the manipulator. Deception is often created by rigging information or prices to entice investors to buy or to sell. Methods for financial deception include repo transactions, Ponzi schemes, fraudulent financial statements, and false incentives to consumers and investors. Some of the most famous examples of financial deception are the London Interbank Offered Rate (LIBOR) fixing, the Enron Scandal of 2001, and the Lehman Brothers scandal of 2008. Financial regulations are designed to prevent deception in financial markets, although it is difficult to detect and prevent acts of financial deception.

### Lehman Brothers Scandal

In understanding financial deception, it is important to first look at the most prominent historic financial deceptions and understand how they occurred and how they were unveiled. An important historic example of these financial manipulations is that of the Lehman Brothers scandal. On September 15, 2008, Lehman Brothers, a global financial services firm, filed for bankruptcy with \$639 billion in assets and \$619 billion in debt on its company balance sheet, representing the largest bankruptcy filing in history. In 2003 and 2004, Lehman acquired five mortgage lenders that practiced Alt-A loans, which are loans made to borrowers without full documentation. Lehman was also securitizing subprime mortgages, which are mortgages made to borrowers with a low credit score. In February 2007, Lehman's stock reached a record high of \$86.18, which made its market value close to \$60 billion. (Market value is the quoted price at which an investor can buy or sell a share of a company at any given time.) This market value, however, was deceptive given that revenue was being generated by mortgages to borrowers without a full credit report and to investors with a low ability to make timely mortgage payments.

The mortgage market crash in March 2007 exposed Lehman's poor securitization practices. Lehman's chief financial officer, however, stated that the risks posed by rising home delinquencies were well contained and would have little to no impact on the firm's earnings; he added that he did not foresee a problem in the subprime market spreading to the rest of the housing market. As the credit crisis began to hit its peak in August 2007, Lehman's stock suffered a dramatic decline. The company eliminated 2,500 mortgage-related jobs and shut down its Alt-A lenders in three states. Lehman stated that these were major changes for the company, but it would remain stable in the hope of retaining investors.

Unfortunately, Lehman had taken on an unusually high ratio of debt to equity. This leverage, coupled with Lehman's high exposure to mortgages, an unstable asset class at the time, made the firm vulnerable to default, a possibility that was not publicized. Investors who believed Lehman's public statements that it was stable and not vulnerable to default ultimately faced significant

losses as the company stock dropped 77 percent in the first week of September 2008.

It is commonly believed that Lehman Brothers was deceptive in its attempts to hide the financial difficulties that the company was facing and in the firm's reliance on subprime mortgages as a revenue driver. This led to one of the largest bankruptcies in financial history, economic turmoil on a federal level, and many investors being unable to recover their initial investments.

### **Repo Transactions and the Enron Scandal**

There are numerous ways financial institutions commit acts of deception by presenting themselves as more stable than they are. One method is called a repo transaction. A repo transaction works by having one company transfer an asset to another company in exchange for short-term cash, with an agreement that the borrower will repay the value on a specific date. This cash goes on the balance sheet instead of troubled assets so that companies look more stable than they are. Repo transactions are described publicly as a sale rather than a loan, which makes the company look like it will never have to repay the money it borrowed. Lehman Brothers committed this act of fraud and was exposed when Citi and JP Morgan, lenders to Lehman, called for their money and Lehman was unable to pay.

Enron, a U.S. energy trading and utilities company, initiated one of the largest accounting frauds in financial history. Enron executives employed accounting practices and policies that falsely and deceptively inflated the company's revenues. By misrepresenting earnings reports while continuing to enjoy the revenue provided by the investors not privy to the true financial condition of Enron, corporate executives embezzled funds funneling in from investments while reporting fraudulent earnings to those investors. The company shares were trading at \$85 before the fraud was discovered, causing the shares to quickly plummet in value to only 30 cents. Once these fraudulent practices came to light on December 2, 2001, Enron filed for Chapter 11 bankruptcy.

Enron's collapse marked the beginning of a string of similar corporate scandals. Congress decided to intervene, and it created the Sarbanes-Oxley Act in 2002. This act created the Public Company Accounting Oversight Board (PCAOB),

which was authorized to establish registration procedures for public accountants, create auditing standards, conduct inspections of public accountants, and hold disciplinary hearings. Other aspects of Sarbanes-Oxley state that senior management is required to certify the accuracy of their corporation's reported financial statements. There is also a mandate that management and auditors establish internal controls and reporting methods on the adequacy of those controls.

### **American Express Settlement**

Another act of financial deception committed by a reputable and powerful institution is that of American Express, a financial services corporation. In 2012, American Express paid \$112.5 million in refunds and fines to settle claims that it charged unlawful late fees and deceived customers to pressure them to pay off outstanding debts or to buy additional credit card services. The company refunded \$85 million to roughly 250,000 customers in addition to paying \$27.5 million in civil fines.

American Express is said to have violated federal laws prohibiting deceptive practices by using false statements to persuade customers to settle outstanding debts. This included false statements to customers that if they agreed to partially pay off their debt the remaining balance would be overlooked. Customers also reported being told that if they signed up for the company's Blue Sky credit card program they would receive \$300 in addition to bonus points. These rewards, however, were never attained.

The Federal Deposit Insurance Corporation (FDIC) and the Utah banking agency found out about these deceptive acts during a routine examination of the company's bank subsidiary. The Consumer Financial Protection Bureau took over the investigations after that, and the Financial Overhaul Law was introduced in 2010 to protect consumers from excessive or hidden fees and other financial threats.

### **Ponzi Schemes**

A particularly devious form of financial deception is the Ponzi scheme. A Ponzi scheme is a fraudulent investing scam in which the promoter promises high rates of return with little to no risk to the investors. Returns are generated for earlier

investors by acquiring new investors, rather than from profit earned by the individual or organization running the operation. The scheme entices new investors with the promise of higher returns than other available investments, with short-term returns that are either abnormally high or unusually consistent. In order to keep the scheme going, new investors must constantly be brought in. This system ultimately fails because the scheme's earnings are less than its payments to investors. Often the high returns lead investors to leave their money in the scheme, allowing the promoter to pay out very little to investors. Instead the promoter sends statements to investors showing them how much they have earned. This enables the scheme to maintain the deception that it is a fund with high returns.

Promoters of the scheme try to minimize withdrawals by offering new plans to investors, and these plans often freeze money for a long period of time in exchange for a higher return. When an investor does wish to withdraw his or her money under the terms of the investment, the requests are typically processed quickly, which gives the illusion to all other investors that the fund is stable. One of the ways that a Ponzi scheme can be discovered is the promoter of the scheme vanishing and taking the remaining investment money. Also, because the scheme requires a continual stream of investments to fund higher returns, once investment slows down the scheme collapses because the promoter does not have enough incoming funds to pay the promised returns.

A famous Ponzi scheme was discovered in 2008 to be run by Bernie Madoff, former chairman of the NASDAQ Stock Market and founder of the market-making firm, Bernard L. Madoff Investment Securities. He was arrested on December 11, 2008, for running an extensive Ponzi scheme. While Madoff never pled guilty to these accusations, there was significant evidence to support the claims, and Madoff was sentenced to 150 years in prison, the maximum allowed under federal guidelines. Only a portion of the funds taken from investors was ever recovered.

### **LIBOR Scandal**

Another form of financial deception concerns the way that banks lend money to each other. In 2012, several financial institutions were found

to be fixing the London Interbank Offered Rate (LIBOR). LIBOR is an average interest rate calculated through submissions of interest rates by major banks in London. The scandal surfaced when it was discovered that banks were falsely inflating or deflating their rates to profit from trades or to give the impression that they were more creditworthy than they actually were. Banks are expected to submit the actual interest rates they are paying or would expect to pay for borrowing from other banks. The LIBOR is intended to be an overall assessment of the health of the financial system because if the banks being polled feel confident about the state of the economy and their institutions, they report a low number. LIBOR is simply calculated through a survey of the member institutions. Barclays Bank was a lead perpetrator in this scandal.

### **History of Financial Regulatory Reform**

The financial industry has a history of regulatory reform. On December 23, 1913, President Woodrow Wilson signed the Federal Reserve Act into law. The Federal Reserve System consists of the Federal Reserve Board, 12 regional reserve banks, and a central banking system. This system allowed for governmental control over the monetary supply. This system is still in place today and provides a framework for regulating the nation's banks, credit, and money supply. This system aided in the creation of several financial regulations and systems that help control the financial system and attempt to deter deception and unethical behavior.

Stock exchanges, such as the New York Stock Exchange and NASDAQ, were created to regulate transactions in equity, bonds, and several other financial securities. These exchanges monitor all transactions and ensure that all parties fulfill the terms of each contract.

The Securities Exchange Commission (SEC) was established in 1934 with a key task of protecting investors from fraudulent activity. The SEC was created by Congress to regulate the securities markets and protect investors. Additionally, it monitors corporate takeovers in the United States. The SEC is composed of five commissioners appointed by the president and approved by the U.S. Senate. The mission of the SEC is to promote full public disclosure and protect the

investing public against fraudulent and manipulative practices in the securities market.

Several other acts are related to minimizing deception in financial markets. The Financial Accounting Standards Board (FASB) sets the Generally Accepted Accounting Principles (GAAP). GAAP is a set of accounting principles that companies use to compile financial statements. GAAP sets a common standard for how to record and report accounting information and attempts to make financial statements transparent in an effort to make deceptive accounting practices more difficult.

After the financial crisis of 2008, Congress passed the Dodd-Frank Wall Street Reform and Consumer Protection Act in 2010. This act gave the federal government the authority to seize large financial institutions that were in trouble. The act also established a council of federal regulators charged with monitoring threats to the financial system; this group also monitors the derivatives market. The act gave shareholders an advisory say in corporate executive compensation. These reforms are key components in federal efforts to combat financial deception and fraud, although reforms and revisions are continually implemented to achieve the most accurate and transparent financial system possible.

Deception in financial markets has received worldwide media attention for its role in several major scandals and the Great Recession. Deception in financial markets can take place with a variety of techniques, and these forms of deception can cause massive harm to companies, investors, employees, and ultimately the economy. For these reasons governments create organizations that can regulate financial markets and prevent and prosecute deceptive practices.

## Fireflies

Viewed from afar, the flickering and flashing of glowing fireflies can light up a dark night's sky. This quality, however, is for much more than mere entertainment, as the emission of light serves several functions. Firefly flashes are a source of protection, communication, and self-presentation. But the adults' glow is also used by some species for deceptive purposes.

The enzyme-driven chemical reaction that allows fireflies to produce light begins shortly after birth. Although the light might seem to attract the attention of predators, it may actually serve to deter attacks, as the enzymes that produce light in the larvae have a bitter and undesirable taste. Throughout the course of evolution, predators learned to associate the glow with this aversive flavor in nascent fireflies. The emission of light, then, serves as a warning signal and source of protection for the glowing larvae. Because of the light's protective function, fireflies' ability to glow does not disappear over the course of maturation.

In fact, many species of firefly evolved to retain the ability to produce light even as adults. As a result, the emission of light by adult fireflies now does more than discourage predator attacks; through evolutionary development and individual maturation, glowing serves multiple functions.

Male fireflies battle for female mates and use their glow in the fight. The females assess size and strength as males display dominance and superiority. Among the characteristics on exhibition during the mating rituals is a firefly's flashing ability. Male fireflies vying for the attention of potential female mates use their light as a form of communication and courtship. Males use varying, complex light patterns as a form of signaling. Males vary the time-delay within flash patterns. Ranging from multiple, fast pulses to fewer, long-lasting flashes, these flash patterns are species specific. The displayed light pattern allows females of some species to locate partners of their own kind and decipher their mating intentions. Females can then use their own pattern of flashes to return responses to their courting counterparts.

While the standards that females use to assess mate viability are yet to be fully understood, scientists believe that males' light signals may also serve as a determining factor for females in mate selection. That is to say, these complicated flashing patterns may allow females to discern which male will provide the most food to help nourish their eggs and afford them the greatest reproductive success. Packages of protein injected with the male's sperm during the mating process serve as sustenance for pregnant females. These bundles are referred to as "nuptial gifts" and are vital for a female firefly's survival during the procreation and birthing processes. Scientists believe that among the complicated patterns of glowing pulses are some indications from the males about their ability to provide this nourishment. In this way, the flash communication assists female fireflies in the imperative task of correctly identifying a well-providing partner. Furthermore, females return light displays to signal their interest to males they judge to be viable partners.

While the majority of female response flash signals are genuine communications of mating interest, at times the flash pattern is a deceptive one. Some species of female fireflies reply to courting males with light patterns that are

intended to mislead males. These females then use the deceived males in order to increase their own chances of survival.

Fireflies must defend themselves against predators, and one primary means of doing so is through chemical emission. The *Photinus* species of firefly produce a unique defensive chemical known as lucibufagin that deters natural predators. However not all species are capable of producing this protection themselves. One such chemically defenseless type of firefly, the female *Photuris* specie, is at risk for being poached. However, *Photuris* females reduce the risk through an evolved, deceptive practice that compensates for their inability to produce lucibufagins. Otherwise chemically defenseless female *Photuris* deceive and steal the chemical from the producing *Photinus* males.

To pilfer lucibufagins, *Photuris* females imitate the flash patterns of *Photinus* fireflies that are capable of naturally producing the chemical. The otherwise defenseless *Photuris* females mimic a particular light pattern that signals reproductive interest to male *Photinus* fireflies that produce the defensive, protective chemical compound. These chemically protected males see what appears to be the species-specific light signal of an interested female mate. The flash pattern deceitfully lures males closer to the female. Once the attracted males are within striking range, the otherwise defenseless female *Photuris* fireflies attack and kill the chemically protected males. After that, the females ingest the males' protective chemicals, thus earning their nickname of the femmes fatales of the firefly world. *Photuris* female fireflies deceive *Photinus* males in order to increase their own chances of survival.

Ultimately, such deception is not rare in nature. Rather, scientists are beginning to discover more and more cases of similar mimicry and trickery in the environment. Just as evolution allows for the development of better self-protection, self-presentation, communication, and sexual selection in nature, so too come varied and improved methods of deceit.

## Fish

All animals act in ways that increase their odds of survival, perpetuate their lineage, and protect their species. Fish and other creatures of the sea have particularly unique ways of doing so. They alter their own appearance, manipulate others' preferences, and work to create false reputations in the service of self-protection and self-advancement. These deceptive practices increase survival rates.

### Altering Physical Appearance

Sea creatures of varying species systematically alter their appearance to protect themselves. Stomatopods, commonly referred to as mantis shrimp, are a small sea creature found on ocean floors. They have distinctive means by which they protect themselves. Mantis shrimp are renowned for their folding forelegs, which they use to smash the hard shells of crabs or clams or spear soft bodies of fish. The smashing mantis shrimp needs less than one second to fully extend its claws and can strike with a force likened to a small caliber bullet. Although powerful given its size, the mantis shrimp is vulnerable and weak against a rival when it molts. After shedding the outer shell, mantis shrimp expose a soft underbody and lose their ability to smash or spear. Thus, they are far

more susceptible to injury if attacked by predators. To protect themselves during these vulnerable periods, mantis shrimp deceive predators by altering their physical appearance. To appear like a more dangerous threat, mantis shrimp elevate their heads and extend all of their appendages and scales, increasing their apparent size. They also expose brightly colored areas of their body, known as the meral spot. The meral spot is located on the inside of the striking appendage of the crustacean and is used as an indication of increased aggression by the signaler. Although without their protective shell and unable to follow through with any aggressive action, mantis shrimp attempt to deter and deceive predators about their physical stature.

Siamese fighting fish use physical battles to deceive competitors about their dominance. The aggressive combat of Siamese fighting fish can result in damage or even death to the weaker opponent. Given the dire consequences of some of the more violent battles, Siamese fish alter their appearance to deter competitors from waging war in the first place. To maintain a dominant guise, Siamese fighting fish pick fights with "losers" of previous physical encounters. They identify the weaker fish by eavesdropping on other battles. That is, they watch others' battles to determine the hierarchy of dominance.

When later approached for battle, the Siamese fighting fish choose to fight the weaker fish that previously lost a battle. Moreover, Siamese fighting fish increase such aggressive actions against weaker competitors when an audience is present, as if publicly displaying their dominance. Siamese fighting fish selectively pick opponents in fights in order to deceive competitors, maintain dominance, and increase survival rates.

### Manipulating Others' Preferences

Like many other species, fish go to great lengths to protect their young from predators, particularly when their young are most vulnerable. For instance, the three-spined stickleback fish use deceptive strategies that attempt to manipulate the preferences of predators. Male sticklebacks stand guard at the entrance to their nest while the eggs develop and hatch. If others approach, sticklebacks attempt to manipulate predators' preferences for food sources. Sticklebacks provide false

*A water balloon fish in Mactan Cebu, the Philippines. If successfully pursued, its backup defense mechanism is to fill its elastic stomach with water or air until it is much larger, deceiving its prey. Tetraodontidae is a family of fish that includes species variously called pufferfish, blowfish, bubblefish, globefish, swellfish, toadfish, and sea squab.*

information about the location of their nest. They may bury their own nest in sand. They use distraction displays to deflect predators from the nest. To suggest nutrition lies elsewhere, sticklebacks swim to a more remote area and feign feeding. If provided with the opportunity, stickleback fish might also feed or feign feeding on eggs from another nest to mislead predators about the location of their own young. Sticklebacks also act in ways that suggest they are eating their own young in order to manipulate predators' beliefs about the number of eggs that remain in that nest. Although these displays can be learned by the predators and may lead to the capture of eggs, the stickleback's deceptive tactics that aim to manipulate the preferences of predators increase survival rates of their young.

Atlantic mollies use deceptive tactics to manipulate the mating perceptions of other mollies. In

freshwater throughout northeastern Mexico and Central America, male mollies engage in mating rituals aimed at winning the affections of the largest female fish. The male molly will display his dorsal fin, thrust in a female's direction, and nibble at her body. However, the mating tactics of male mollies change in the presence of an audience. When another male fish is present, Atlantic male mollies reduce their efforts to attract the attention of and mate with large females. Instead, when other males are present, male mollies feign interest in smaller female fish. In attempting to deceptively manipulate the preferences of other males, Atlantic mollies increase the chances for their own mating success.

### **Deception for the Creation of a False Reputation**

Cleaner fish act in ways that appear service-oriented in order to create a false reputation and deceptively increase their own food supply. Cleaner fish nibble away dead skin and unhealthy bacteria from the bodies of other fish. They build up clientele by discarding deadly bacteria from clients and do so more intensely when in the presence of additional fish who may be seeking services. To increase the number of fish waiting to be served, cleaner fish often perform, but sometimes only feign, cleaning services. After having established a reputation as a cleaner and amassed a group of clients, cleaner fish turn their attention to the healthy, nutritious skin cells. To meet their own dietary needs, cleaner fish bite their host fish, feeding off the nutritious bacteria. But in so doing they risk losing a client who is dissatisfied with the aggressive service. The cleaner fish deceive clients about the quality of service they provide in order to increase their own chances of meeting personal nutritional needs.

### **Conclusion**

Like thousands of species, fish and crustaceans use deceptive strategies to increase survival. They manipulate their own physical appearance to protect themselves. They manipulate the preferences of other fish to protect their young and increase the chances for their own success at mating, and they attempt to establish false reputations to increase their own attempts at meeting their nutritional needs. These deceptive practices protect

those committing the acts and aid in survival of the individual, their genes, and their species.

## Football

Deception is a key tactic for success in football. Deception is found throughout the game of football, as players and coaches try to gain an advantage over the competition on the field with misleading injury reports and the use of performance-enhancing drugs.

### Deception During Play

Deception on the field includes misleading actions and trick plays. Offensive players use misleading

actions to focus defensive players' attention away from where the ball is actually going. Distracting actions such as the pump fake, in which the quarterback completes a fake throwing motion toward a wide receiver, are completed multiple times per game. The thrower tries to lure defenders in one direction, only to throw the ball to the other side of the field or at a different time than what was perceived by the defender.

Another misleading action that uses deception to distract defensive players is the draw play. In a draw play the quarterback pretends to pass to lure defenders further away from the ball when actually the ball is given to a running back. The bootleg modifies the draw play with another layer of deception. In the bootleg the quarterback only pretends to hand the ball off to the running back, which draws the attention of the defenders to the running back and away from the quarterback.

Trick plays, in contrast, are used to confuse defenses and gain a temporary advantage in the form of an extra possession or scoring play over their opponent. A half-back pass play deceives defensive players into believing that a running back will run the ball, when in fact he will pass to a receiver. A Statue of Liberty play fools the defense into trying to stop a pass when actually the offense plans to execute a run. In the Statue of Liberty play the quarterback drops back to pass, while simultaneously switching the ball into his nonthrowing hand and faking a pass downfield. The running back then takes the ball from the quarterback hiding behind the larger offensive lineman and sprints toward the opposite direction of the field. In a 2007 National Collegiate Athletic Association (NCAA) bowl game, Boise State quarterback Jared Zabransky executed this play, which led his team to the game-winning score as time expired.

Offensive players can also deceive defensive players by running a hook and ladder play involving precise timing between the quarterback and two receivers. During a hook and ladder play one receiver runs downfield and turns back around to face the quarterback in order to catch a pass. As the receiver catches the pass and defenders swarm, the same player flips the ball behind to another receiver cutting in front of him to break away from the defenders and pick up additional yardage. In a 1982 National Football League (NFL)

playoff game, the Miami Dolphins implemented the hook and ladder when receiver Duriel Harris caught a pass from quarterback Don Strock and then passed the ball backward to Tony Nathan, who ran for the score.

The flea flicker play creates an additional illusion of a running play while a longpass play is executed. During a flea flicker, the quarterback hands the ball off to the running back in order to have defenders commit to stopping the runner. The running back, however, tosses the ball back to the quarterback, who passes the ball to a receiver downfield. In a 2009 NFL playoff game, quarterback Kurt Warner handed the ball off to running back Edgerrin James, who ran two yards before pitching the ball backward to Warner. Warner then threw the ball downfield to receiver Larry Fitzgerald for the first score of the game.

Deception has also been integrated into football during kicking or special teams plays. During a kickoff return in a 1999 NFL playoff game, Tennessee Titans' player Frank Wycheck began returning the kick on his right side of the field. As potential tacklers approached, Wycheck threw a backward pass to the left side of the field to teammate Kevin Dyson. Dyson ran up the left side of the field for a touchdown. The Titans won with this deceptive play as time expired, which became known as The Music City Miracle.

### **Misrepresenting Players' Injuries**

Deception also plays a role off the football field. For instance, coaches often use deception to disrupt other teams' preparation and game planning. Injury reports that list injured players have been used as a deceptive tool to disrupt an opposing team's preparation, with one team either under- or overstating injuries to deceive the opposing team. The NFL has taken measures to reduce pre-game deception in injury reports by threatening teams with lofty fines if they are caught hiding an individual's injury status.

Bill Belichick, head coach of the New England Patriots, is famous for misleading opposing coaches by putting Tom Brady, the team's star quarterback, on the injury report for all 16 games in a season. Belichick defended his deceitful act by claiming, "he [Tom Brady] is not 100 percent," despite playing in every game that season. In

2005, former Dallas Cowboys' coach Bill Parcells misled opposing coaches by stating that former running back Julius Jones was "limited" during practice and that the injury was not severe. When it came time to play the game, Jones did not participate given the severity of his injury. The deception led the opponent to prepare for Jones as an active player. When Jones ended up not playing, the other team had wasted time by focusing on a player who did not affect the game.

Team doctors sometimes play a role in misrepresenting injury information. In 2009, the NFL adopted stricter policies regarding injuries and revised its return-to-play policy by prohibiting players from returning to play after exhibiting any concussion-like symptoms. This policy attempts to diminish deception by forcing players to pass medical examinations conducted by outside officials, not just team doctors, before returning to the field.

### **Deceptive Interviews and Concussion Reports**

Player interviews can also involve misleading responses before or after a game. Players under contract meet with a public relations coordinator, coach, or general manager before engaging in a press conference or interview. Players are coached on how to articulate precise messages without giving away team strategy or secrets. These crafted responses may be used to deceive opponents by covering up, hiding, or omitting important information. Public relations officials closely monitor information within a franchise and control the extent to which it is shared publicly.

Recently, the NFL itself has come under scrutiny for deliberately masking the risks associated with brain damage to players experiencing concussions. From 1994 to 2007 the NFL employed a Mild Traumatic Brain Injury (MTBI) Committee to conceal the medical risks of head injuries. This NFL-funded committee was used to provide misleading information from studies and to deny the link between concussions and long-term brain consequences. In 1994, studies from the MTBI were compiled into pamphlets with many inaccuracies that were distributed to every football player. NFL players were misled into believing that head injuries would not cause any long-term health complications in the future.

## Performance-Enhancing Drugs

Deception in football can also be influenced by illegal or unethical activities in an attempt to gain a competitive advantage. Football players work hard to reach their full athletic potential by improving their strength, conditioning, and skill level. Some football players striving for better performance may turn to performance-enhancing drugs (PEDs) or steroids. It is estimated that between 15 and 20 percent of football players use PEDs. Initial drug tests from the NFL gave players advance notice of the test, allowing for clean urine alternatives to be used. In a steroid-conscious world, drug testing in football has become randomized in order to minimize the rate of deception, but players have sought out other forms of PEDs that the NFL is currently unable to test for.

The incentives for deception in professional football are high. Because there are only 16 games played during a season (excluding play-offs), each game is important for a chance to compete in the championship. In 2007, New England Patriots' coach Belichick was caught having his staff videotape the New York Jets' defensive play signals during practice. This devious act, known as Spygate, gave Belichick's team an unfair competitive advantage over the opponent during the actual game. Similarly, in 2012 the New Orleans Saints were caught with a secret "pay for pain" bounty program, in which players were secretly awarded large amounts of money for injuring or removing an opposing player from the game. Football's incentives can lead teams to have a "win at all costs" mentality that in turn may lead players and coaches to engage in deception that goes beyond the deceptive actions on the field, which are an accepted and important part of the game.

# Forgery, Art

An art forgery is an object that was intentionally produced to deceive a purchaser as to its date and authorship. This is distinct from the manufacture of copies without the intent of fraud, as well as the imitation of works by art masters by their pupils and later followers, and misattributed works.

## History of Art Forgery

The forgery of works of art is as old as the market for collectors for such works. Accordingly, forgeries were produced even in antiquity. For instance, the ancient Roman writer Phaedrus mentioned in the prologue to his *Aesop's Fables* that sculptors would claim that works they produced were made by earlier famous artists, such as Praxiteles or Myron of Eleutherai, or that forged paintings were attributed to Zeuxis. Cypriot pottery, such as white slip milk bowls and *bilbils*, was a desired import during the Late Bronze Age in Palestine; although the remains of many actual imported vessels are regularly found in archaeological excavations, many locally produced imitations are also commonly found.

During the Renaissance, art historian Giorgio Vasari mentioned that artist Lorenzo Ghiberti made counterfeit Greek and Roman medals that appeared to be antiques. Vasari also reported on a marble Cupid, known as the *Sleeping Eros*, sculpted by Michelangelo Buonarroti who, after completing it, buried it in a vineyard to acquire a false antique look. Another Renaissance forgery was the painting by Luca Giordano of *Christ Healing a Lamé Man*, which he passed off as a work of his more famous contemporary Albrecht Durer.

During the 18th century, soon after the rediscovery of Pompeii and Herculaneum, Giuseppe Guerra was producing forged Roman paintings for sale to collectors. Also in the 18th century, William Sykes, an English forger, sold fakes of works supposedly painted by Jan van Eyck and other well-known masters.

### Art Museums and Forgery

Museums have often unknowingly purchased forgeries. The Louvre, for example, purchased the gold tiara of Saitapharnes, an inscribed headdress of solid gold that depicted scenes from the *Iliad*, and which was thought to date to the 3rd century B.C.E., until a forger from Odessa admitted early in the 20th century that he had made it. In 1935, the British Museum removed from exhibition what it had thought was an Etruscan sarcophagus from the 6th century B.C.E. The woman depicted on the sarcophagus was wearing undergarments typical of the 19th century C.E., and the male figure next to her was nude, unlike any other known examples from that period.

Between 1915 and 1921, the Metropolitan Museum of Art in New York City purchased three purported large Etruscan terra-cotta warriors that were, in fact, created by Alfonso and Pio Riccardi and three of their six sons, with the assistance of Italian sculptor Alfredo Fioravanti, who in 1961 admitted how they had been made. After his admission, the museum finally announced that the statues were forgeries, which had been suggested by earlier chemical tests of the glazes, as well as by the extraordinarily even firing characteristics, which would have been very difficult for the ancient Etruscans to have achieved.

A few museums intentionally exhibit forgeries. For example, the Victoria and Albert Museum in

London has a separate gallery reserved for high-quality forgeries.

### Notorious Modern Art Forgers

Several modern art forgers in the late 19th and 20th centuries have gained notoriety for their fakes. Alceo Dossena (1878–1936) an Italian sculptor, could imitate and sell works accepted as Greek, Etruscan, medieval, and Renaissance originals. Icilio Federico Joni (1866–1946) was an Italian artist who fooled noted art historians, such as Bernard Berenson, with his numerous forgeries. Han van Meegeren (1889–1947) was a Dutch painter who is known to have painted and sold at least 14 forgeries attributed to 17th-century artists Johannes Vermeer and Pieter De Hooch. Several of van Meegeren's works won critical acclaim from art historians as newly found masterpieces; it is estimated that he earned the equivalent of over \$30 million for his forgeries. Theo van Wijn-gaaren (1874–1952) was another Dutch art forger who sometimes assisted van Meegeren.

Otto Wacker (1898–1970) put at least 33 fake Vincent van Gogh paintings on the market. Chang Sai-chien (1899–1983) was a Chinese artist and master forger of paintings by great Chinese masters. Elmyr de Hory (1905–76), a Spanish artist who had been a Jewish aristocrat before World War II reduced him to poverty, claimed to have painted thousands of forgeries, including those of artists such as Henri Matisse. Amedeo Modigliani, and Pablo Picasso. Lothar Malskard (1913–88) was commissioned to restore medieval frescoes in European cathedrals, but instead of engaging in restoration he simply whitewashed the walls and painted new images; however, several anachronisms in his works were eventually noticed. Malskard also made forgeries of more modern artists, including Henri de Toulouse-Lautrec and Marc Chagall.

Tom Keating (1917–84) was a British artist who created over 2,000 forgeries of works by 100 different artists. Eric Hebborn (1934–96) was a British artist who forged numerous drawings by great artists like Raphael, Peter Paul Rubens, Anthony van Dyck, Nicolas Poussin, and Giovanni Battista Tiepolo. John Myatt (b. 1945), a British artist, forged over 200 paintings of famous artists, such as Chagall, Georges Braque, and Benjamin Nicholson, which he was able to sell with the help of his

accomplice John Drewe (b. 1948), who arranged for false documentation as to their authenticity. Jean-Pierre Schecroun, a French artist, created about 80 works he claimed were by Picasso and other modern masters. Mark A. Landis (b. 1955), an American, created and donated over 100 forgeries to U.S. museums. Shaun Greenhalgh (b. 1961) created forged sculpture of diverse styles and periods, including purported Assyrian, Egyptian, and modern pieces.

Some forgers, after their notoriety is established, sell art works as their own creations. For instance, former forger John Myatt now sells works of art as his own reproductions. David Stein (1935–99) was an art dealer who mastered the artistic styles of several famous artists, such as Braque, Chagall, Matisse, Picasso, Jean Cocteau, Paul Klee, Joan Miró, and Georges Rouault, so that he could, and did, produce and sell forgeries as originals by these great artists; after being caught he then produced works of his own. Ken Perenyi is an American artist who, after years of selling forgeries, now produces works in the style of many noted artists, including Martin Johnson Heade, Francesco Guardi, John Peto, Miró, Modigliani, and Picasso.

### Techniques of Forgery and Deception

Art forgers utilize a vast array of techniques in attempting to perpetrate their fraud. Signs of aging are a common area of concern that forgers of older works of art must contend with. Many objects, particularly paintings and ceramics, form a dense pattern of cracking, known as craquelure, on their surface. This is the result of natural drying out, as the paint or other material ages over time and becomes less flexible and shrinks. Forgers attempt to imitate this craquelure by varied techniques, including rolling up a painting, baking it, or treating it with various chemicals, such as formaldehyde. Corrosion may be imitated by means of applying hydrochloric acid. Calcinations can be mimicked with the use of an oxy-hydrogen flame or by baking in an electric oven. Patinas on bronzes can be faked through the use of varnish, wine vinegar, nitric acid, copper acetate, ammonia salts, or by electrolytic methods. Provenance documentation, that is, the historical records of the ownership and display of works of art, can readily be falsified.

Art forgeries are generally initially detected by means of stylistic analysis and by historical detection, such as by identifying anachronisms in details or inconsistencies in iconography, but scientific techniques of analysis can also be useful in confirming the fraud. Microscopic inspection is a simple scientific technique, but it can reveal forgeries, such as those that have fake craquelure, false worm holes, or even modern grinding of pigments that may have been unavailable at the time the purported work was said to have been produced. Greater and more revealing magnification can be achieved by means of electron microscopes, using either scanning electron microscopy of a highly polished surface or transmission electron microscopy of a very thin cross section.

*The Faun, a sculpture acquired by the Art Institute of Chicago in 1997 and attributed to Paul Gauguin, was determined in 2007 to be a creative, well-researched forgery produced by the convicted Greenhalgh family from Bolton, England, who produced numerous fake art pieces. The documentation of the work's provenance is also believed to be counterfeit.*

Infrared photographs or ultraviolet radiation of the work in question may help reveal repaintings and other inappropriate modifications.

Ultraviolet light can reveal several indications of forgery, such as artificial patina on marble, oil paint recently applied to an earlier painted surface, and repairs to ancient metal objects. X-ray radiographs can be very revealing; for instance, they may help indicate if a forgery was constructed on a prepared suspect foundation, such as gesso. The elemental composition of an art object can be determined by various inspection methods, such as mass spectrometry, optical emission, and inductively coupled plasma spectrometry, or X-ray fluorescence and particle-induced emission spectrometry of inorganic materials, and assorted chromatography methods for organic materials.

An array of dating techniques is also used to date archaeological artifacts in order to determine if they are actually from the appropriate era. Radiocarbon 14 dating is one of the best-known dating techniques, but it is limited to objects created up to about 60,000 years ago and made of materials from living organisms, like wood, bone, textiles, parchment, and leather. Uranium-thorium dating is a related, but much less useful, dating technique. Dendrochronology uses tree ring patterns from wooden objects, like statues, wood panels, or frames, which are compared against a known and dated registry to establish when the tree was harvested. Thermoluminescence is a technique used to date ceramic artifacts by heating them up. Source analysis techniques can be used to determine where artifacts originated, such as using stable isotope analysis to determine the specific quarry from which stone was extracted. As forgers become more resourceful in producing their fakes, detection techniques will have to become equally sophisticated to catch these frauds.

## Frank, Mark

Mark G. Frank is a professor of communication and director of the Communication Science Center at the University at Buffalo in Buffalo, New York. A social psychologist by training, he is a well-known and respected deception researcher and an expert in the area of nonverbal communication. His work is characterized by an applied focus, especially as related to law enforcement, and by its association with the ideas of Paul Ekman.

Frank earned his Ph.D. in social psychology from Cornell University in Ithaca, New York, in 1989. With a National Research Service Award from the National Institute of Mental Health, Frank did postdoctoral research in the Department of Psychiatry at the University of California at San Francisco Medical School, where he began his association with Ekman. In 1992, Frank accepted a position at the School of Psychology at the University of New South Wales in Sydney, Australia. In 1996, he joined the Department of Communication at Rutgers University in New Brunswick, New Jersey. In 2005, he accepted a position in the Communication Department at the University of Buffalo in New York, where he was promoted to the rank of full professor.

Frank has published numerous scholarly articles and book chapters on the topics of nonverbal communication, especially facial expressions, and deception detection. His most well-known works include collaborations with Ekman, Maureen O'Sullivan, and Thomas Feeley. In his research, Frank has advocated for the importance of studying high-stakes lies in deception detection and the idea that momentary facial expressions provide useful signals in lie detection. His research has been funded by the National Science Foundation and the Department of Homeland Security.

One of Frank's best-known studies was published in *Psychological Science* in 1999. Ekman, O'Sullivan, and Frank compared people with a variety of occupations in terms of their skill at detecting lies. Federal officers did better than other groups on a lie detection task, and were 73 percent accurate, compared with sheriffs (67 percent), federal judges (62 percent), psychologists (58 percent to 68 percent), and law enforcement officers (51 percent). The finding of substantial occupational differences in deception detection ability, however, generally has not been replicated in the research literature as a whole, and therefore findings on occupational differences are controversial.

Frank and Ekman reported an informative experiment in the *Journal of Personality and Social Psychology* in 2004. They had subjects lie or tell the truth in two different types of situations, a mock crime and an opinion about a current event. The truths and lies were then shown to a sample of raters who judged each for honesty. The main findings were that some people were much more believable than others, and that people who were believable in one situation tended to be believable in the other situations. This suggests that some people are much better liars than others.

A third example of Frank's work is an examination of research investigating the effectiveness of training people to detect lies. After examining 20 prior experiments, Frank and Feeley found that nonverbal training in deception detection skills improved accuracy from an average of 54 percent to an average of 58 percent. Nonverbal training appears to improve deception detection accuracy, but it does not seem to improve accuracy very much. Frank and Feeley discussed ways to improve the effectiveness of training.

Besides academic research, Frank is a consultant and trains law enforcement professionals around the world. He has worked with various local agencies as well as the Bureau of Alcohol, Tobacco, and Firearms (ATF); the Federal Bureau of Investigation (FBI); Transportation Security Administration; Scotland Yard; and Australian Customs. He also has presented briefings to the U.S. Congress on deception and counterterrorism.

A leading authority on behavioral observation, Frank in 2013 worked with the Transportation Security Administration (TSA) to further develop and test the TSA's behavioral screening program, to be implemented in 40 major airports nationwide. His research has been funded by the National Science Foundation and the Department of Homeland Security.

Frank has appeared in numerous media outlets, receiving notable coverage from the British Broadcasting Corporation (BBC), National Public Radio (NPR), *The New Yorker*, the *New York Times*, the Learning Channel, the Discovery Channel, the National Geographic Channel, Cable News Network (CNN), FOX News Channel, and the television programs *Oprah*, *48 Hours*, and *Dateline NBC*.

## Frankfurt, Harry G.

Harry G. Frankfurt is an American analytic philosopher who taught at Princeton and Yale Universities. He is particularly known for his 2005 best seller *On Bullshit*, based on his 1986 paper of the same name. He also made significant contributions to the study of free will through his analysis of what came to be called Frankfurt Style Cases. Both of these contributions are relevant for the study of lying and deception. In the first case, Frankfurt argues that bullshit as a kind of lying, or disregard for the truth, is damagingly rampant in contemporary society. In the second case, Frankfurt relies on examples of possible deception or manipulation that nevertheless seem to include free will and are contrary to libertarian intuitions about freedom.

### **On Bullshit**

Frankfurt's purpose in his book *On Bullshit* is to clarify this concept, which he believes is common in contemporary society. He believes society is so full of bullshit that most people believe they can recognize it, and yet it remains undefined. Bullshit is different from lying. It is more akin to deception. Frankfurt believes that the liar is able to identify the truth and sets himself in opposition to it. By way of contrast, the person involved in bullshit may or may not be lying and may or may not be able to identify the truth. The person involved in bullshit might get his facts correct. The difference is that the "getting it correct" is not the aim of bullshit. Rather, the "bullshitter" is concerned with attaining his own personal end rather than communicating, or opposing, the truth per se.

Contemporary American culture encourages bullshit by encouraging sincerity. Sincerity is not the same as integrity. Sincerity is the honest

reporting of a person's current desires. Integrity is the concern for consistency between individuals' beliefs and between what they say and do. Sincerity does not include this concern for consistency but is merely concerned with current desires. Bullshit is a tool that sincere persons use to attain their desires and to convince others to help in attaining these desires. Thus, the bullshitter has a complete disregard for truth and instead elevates his desires as absolute. This elevation of desires is the person's current desires because desires change and fluctuate over time.

Frankfurt identifies the role of sincerity and bullshit as a feature of the postmodern world. Postmodernism rejects the one truth and emphasizes many truths, and these truths rooted in individual desires are then elevated as the absolute standard of right and wrong. This loss of appreciation for truth is directly proportional to the rise of bullshit. Frankfurt laments this societal condition but also notes that society is almost universally incriminated in its use. He does not provide a remedy for this situation beyond encouraging people to value what is objectively true. He also identifies a few preconditions that give rise to bullshit. While postmodernity is perhaps steeped in bullshit, bullshit is not unique or postmodern, and postmodernity may itself be a response to the bullshit of modernity.

Frankfurt maintains the first precondition for bullshit is that individuals elevate their current desires above a concern for truth. In so doing, they are by implication neglecting the rational sides of their natures. There need not be a dichotomy between reason and desire, rather there is a relationship between what individuals believe to be good and what they desire. Consequently, those who take for granted that their current desires are indeed aimed at what is truly good are neglecting the critical examination of their assumption; they are leading the unexamined life.

This leads to the second precondition, which is that such persons do not believe that they need to seek to know. Third, there is a misidentification of what is good, or a confusion of what is desired with what is good, or a disinclination to know (as opposed to have an opinion about) what is good. Finally, these preconditions can be summarized in saying that such persons do not fear ignorance about the good but only fear the failure to

appease their current desires. All of these preconditions involve self-deception about one's ignorance concerning the truth and the good. It is this unexamined life, neglect of seeking knowledge, confusion of desire and the good, and not fearing the failure to achieve what is good that are the fertile soil for bullshit.

### Frankfurt Style Cases

Frankfurt is also well known for what have come to be called Frankfurt Style Cases. These cases are a method of showing that libertarian assumptions about what it means to be free are incorrect. The libertarian view of free will says that a person is free only if he could have done otherwise. This has come to be articulated as the Principle of Alternative Possibilities (PAP).

Frankfurt sets up thought experiments in which a person does not have this possibility, and yet other people nevertheless would want to say that this person is free. Part of the reason for this is that the person in these cases is doing what he wants, there is no restriction on his will (want), and therefore he has a free will. This is sometimes called a compatibilist view of free will, because in this view a free will is compatible with predetermination.

Frankfurt Style Cases can involve instances of possible deceit. For instance, a person has been hired to assassinate a government official. The evil scientist who hired the assassin wants to make sure he will go through with the assassination. In order to achieve this, the evil scientist implanted a device in the assassin's brain, so if the assassin begins to have second thoughts, the device will block these and enable the assassin to commit the murder. In actuality, the assassin does not have second thoughts and goes through with the murder. In this case, one would hold the assassin responsible for murder, even though he did not have alternative possibilities. Therefore, PAP is not a sufficient condition for free will. It can be concluded from this that a free will is an unrestricted will; it is doing what one wants.

## Freud, Sigmund

Though he synthesized many pre-existing ideas, Sigmund Freud is rightly considered the founding father of psychoanalysis. The outlines of what is now recognized as psychoanalysis were in place by 1895, but Freud continually elaborated on them right up to his death in London in 1939. What was so revolutionary, and remains so controversial, about Freud's invention was its impact on Enlightenment conceptions of truth and thus of the nature of lying and deception. However, this impact is often measured by the very philosophical notion of truth that Freud displaced, thereby obscuring the roots of his psychoanalytic theory in his clinical practice.

*Studies on Hysteria*, which Freud co-wrote with fellow psychiatrist Josef Breuer, was published in 1895. In this work Freud was already seeking truth in unusual places. Whereas the philosophical tradition founded by Aristotle sought truth in the form of syllogistic propositions (statements such as "All men are mortal, Greeks are men, therefore Greeks are mortal"), and whereas subsequent philosophies of language tended to measure truth by the speaker's alleged intention, Freud's saw truth as hidden in speech rather than expressed by it and thus as intrinsically connected to deception. *Studies in Hysteria* viewed pathological symptoms as conveying, in a distorted form, a truth largely excluded from the hysteric's conscious speech. Moreover, as he developed a theory of sexual repression to explain these patient's symptoms, Freud came to view the hysteric's speech as akin to a lie that deceived the patient about the underlying (sexual) truth of his or her suffering.

The now famous “talking cure” allowed this lie to be unfolded through so-called free association: the unhindered production of speech on the part of the patient without regard for meaning or narrative. Yet it also allowed the psychoanalyst to interpret the resulting speech’s hidden truth. Thanks to the theory of repression, this led to a situation similar to the one William Shakespeare intimates when, in *Hamlet*, he has Queen Gertrude say, “the lady doth protest too much, methinks.” In other words, from a psychoanalytic perspective vehement denial can be evidence of resistance and therefore a displaced indication of the existence of what is denied. Conversely, even a heartfelt truth-claim can operate as a defensive concealment of its opposite. In this sense, lying and deception were not the same after the Freudian revolution.

*The Interpretation of Dreams* (1899) develops a structural model of the psyche that clarifies why earnest conviction cannot be the measure of the truth-content of a patient’s speech. Psychoanalytic truth is located not at the level of intention, in what Freud calls the “conscious” system, but in an entirely different region where the “speech” of a dream, but also speech in general, escapes the conscious control of the ego. This is clearest in the example of parapraxes, such as the famous “Freudian slip.” This is when a verbal mistake is said to reveal an unconscious motivation of which the speaker is completely unaware.

By the time Freud had published *The Psychopathology of Everyday Life* (1901), in which he analyzed, among other things, memory and forgetting, he was able to group very diverse phenomena—from neurotic symptoms to dreams, from slips of the tongue to witticisms—under the same heading of “compromise formations.” In other words, these were all hybrid formations halfway between lies (egoic repression) and truths (the libidinal instincts of the unconscious). To a trained psychoanalyst then, these diverse phenomena could be interpreted to lay bare their latent truth.

Once Freud had established the main conceptual pillars of his new discipline, he audaciously moved on to anthropology, social theory, comparative religion, and group psychology with works like *Totem and Taboo* (1913), *Civilization and its Discontents* (1930), and *Moses and Monotheism*

(1939), applying psychoanalysis to both micro- and macroscale epiphenomena.

### Criticism of Freud

Because of their impact on philosophical notions of truth as rational, intentional statements of verifiable fact, Freudian ideas have been the target of much philosophical ire. Karl Popper argued that psychoanalysis would never be a valid science because it fails the test of “falsifiability”: it cannot posit a scenario that would definitively disprove it. Jean-Paul Sartre criticized Freudian psychoanalysis for presenting an unconscious that determines individuals’ actions and curbs their freedom, providing an excuse for what Sartre called “bad faith,” meaning a socially enforced self-deception leading to an inauthentic existence. Gilles Deleuze and Félix Guattari further attacked Freud’s tendency to universalize the Oedipus Complex (the phase in development that Freud posited between the ages of 3 and 5, when the boy is said to experience lustful feelings toward his mother and murderous feelings toward his father), without acknowledging how complicit this complex is with the renunciation of desire demanded by capitalist social formations. Freud has also been heavily criticized by many feminists for formulating a patriarchal or male-dominated concept of sexuality.

Many of these criticisms should be taken seriously. However, many also arguably impose a primarily philosophical concept of truth on to Freud’s work and then measure his alleged dogmatism from that standpoint. Freud, who regularly distanced himself from philosophy, always maintained that the concept of the unconscious was a working “hypothesis” whose real efficacy lay not in universal or global explanations of the human condition per se, but in the intimate setting of psychoanalytic therapy. It is in clinical practice, then, that “giving the lie” to a patient’s speech through interpretation can liberate another truth, that of the unconscious, from its deceptive appearance. As Freud’s clinical practice developed, interpretation became less and less about decoding an encrypted meaning to find a single underlying truth and more and more about intervening in the causes of suffering for a specific individual.

## Frey, James

American author James Frey wrote *A Million Little Pieces*, published by Doubleday in 2003. This memoir—about the author's struggle to overcome drug addiction—was selected by Oprah's Book Club in 2005 and appeared at the top of the *New York Times* paperback nonfiction best-sellers list. In 2006, The Smoking Gun, a Web site that uses legal documents to reveal scandals in the lives of famous people, published proof that Frey's book exaggerated, and even fabricated, important

details about several events. In the aftermath of this revelation, Oprah Winfrey confronted Frey on her television show, publishers offered refunds for the book's purchase price, and Frey was dropped by his literary manager. Later editions of *A Million Little Pieces* and its sequel, *My Friend Leonard* (2005), included an Author's Note explaining the falsified details. Other memoirs published before *A Million Little Pieces* were revealed as fully or partially untrue, but the controversy surrounding Frey's work particularly impacted reviewer and reader reception of memoirs and influenced scholarly work about life writing.

In *A Million Little Pieces*, Frey uses a minimalist, slangy style to trace his trajectory from recreational drug user to addict and to recount his experiences in a treatment center. The book's reviews were mixed, and some even questioned the memoir's veracity, but—thanks to the popularity of Oprah's Book Club—the book sold nearly two million copies in 2005. *A Million Little Pieces* might have remained just another best seller if journalists from The Smoking Gun had never discovered evidence that sections of the purportedly nonfiction book were fictionalized.

In a January 2006 article, The Smoking Gun reported several findings. Frey's claim in *A Million Little Pieces* that he spent a week in jail following his first driving-under-the-influence (DUI) arrest was untrue; records from Berrien County, Michigan, indicate that he was released to his parents on bond and paid a \$305 fine. While Frey tells a dramatic story about spending 90 days in jail after being arrested for hitting a police officer, disturbing the peace, and possessing a narcotic with intent to distribute, records from Licking County, Ohio, indicate that the author was never prosecuted or incarcerated for any of these crimes. In fact, he spent only five hours in custody, during which he received two traffic tickets and a summons for violating open container laws. (The fabricated Ohio episode also figures prominently in Frey's follow-up memoir, *My Friend Leonard*.)

The Smoking Gun was unable to find any Michigan or North Carolina records pertaining to Frey being wanted on charges of drug possession, even though these charges appear in the memoir and would, assumedly, appear in state paperwork. *The Smoking Gun* did succeed, however, in finding evidence undermining Frey's account of being

ostracized for his role in a fatal accident in his hometown. Interviews with the victims' families and with police officers indicated that Frey had no connection with the accident, which functions in the memoir as a symbol of Frey's feelings of alienation.

After *The Smoking Gun* published its exposé, Frey appeared on Cable News Network's (CNN) *Larry King Live* to discuss the allegations. Frey defended his book by repeatedly stating that a memoir is by nature subjective, reliant on the author's recollections rather than fully verifiable. Winfrey called the show to proclaim her support of Frey and to suggest that the book's message of redemption remained valuable despite questions about factual accuracy.

Winfrey's response later changed. During a January 2006 episode of her show, Winfrey confessed to feeling fooled by Frey, and she pressed the author to tell the truth. Frey stated that *The Smoking Gun*'s findings were correct and claimed that his fabrications were coping mechanisms, allowing him to create an alter ego when he felt vulnerable. (He also indicated that he exaggerated details in order to make the book more dramatic.) Winfrey confronted Frey about additional scenes in the book, including his girlfriend's alleged suicide by hanging (the victim actually slashed her wrists) and his story about undergoing two root canals without anesthesia (Frey could not verify).

In the short term, the controversy negatively impacted James Frey's career, although he has published two books since *A Million Little Pieces* and *My Friend Leonard*. Frey's literary manager dropped him from her roster. Frey also lost his contract with Riverhead Books, publisher of *My Friend Leonard*. His next book, the novel *Bright Shiny Morning* (2008), was picked up by HarperCollins, which gave him a three-book contract. Also, he and Jobie Hughes cowrote the Lorien Legacies young adult book series under the pseudonym Pittacus Lore; one book from the series, *I Am Number Four*, was adapted for film in 2011. Publicity for his most recent novel, *The Final Testament of the Holy Bible* (2011), depicts Frey as a rebel besieged by the media. One representative of said media—Winfrey herself—reconciled with Frey; he appeared on her show again in 2011.

Recent scholarship about life writing has addressed the Frey controversy. Leigh Gilmore

characterizes *A Million Little Pieces* as neoconfessional, a narrative (and aftermath) trafficking in tropes of confession, public shaming, and redemption to produce notoriety, celebrity, and even more confessional memoirs. Using Philippe Lejeune's concept of the autobiographical pact, Allan G. Borst notes similarities between Frey's book and other addiction memoirs, suggesting that a pact of fidelity to truth in life writing does not easily apply to autobiographical work addressing substance abuse, in which lines between truth and fiction are inevitably blurry. Mark Nunes focuses on the controversy's aftermath rather than the memoir itself, depicting online responses to Frey's lies as a communicative event challenging notions of narrative representation and authenticity.

## Functional Magnetic Resonance Imaging

Magnetic resonance imaging (MRI) is a medical imaging technique employing strong magnetic fields to produce three-dimensional, high-resolution images of the human body. Functional MRI (fMRI) differs from normal MRI used in medical

settings by the speed at which entire three-dimensional images of the brain are acquired. A typical fMRI scanner will take an image of a complete brain every few seconds, which permits the comparison of changes associated with cognitive activity in one part of the brain with that same part of the brain a few seconds later.

By far the most common approach to understanding cognitive processes is the use of the blood oxygenation level dependent (BOLD) signal. The BOLD signal relies on the naturally occurring differences in the magnetic properties of various types of brain tissues and on the magnetic properties of oxygen-rich and oxygen-depleted hemoglobin. It is understood that the activity of brain cells and blood flow within the brain are closely related, but fMRI scans do not measure activity itself—rather, the relative changes in oxygenated blood flow over time, allowing researchers to infer activity in a specific region of the brain by virtue of its demand for oxygen-rich blood.

### Deception Experiments

Contrasting an experimental condition with a control condition is the principle by which cognitive neuroscientists try to understand which parts of the brain are active while performing a certain task. Researchers will try to design an experiment which comprises two tasks that are identical in every way except for one very specific variable of interest. When the patterns of brain activity are later overlaid and compared for each of the two conditions, any differences in activity are thought to be attributable to the difference in the variable of interest.

In the case of deception experiments, the standard comparison will be to overlay brain activation patterns seen when performing truthful trials of a task (considered to be a baseline, or control) with deceptive trials. The difference observed between the two can then be attributed to deception. The strength of this evidence depends heavily on the sound design of the experimental procedure.

It is important to be aware of the restrictions that fMRI-based research imposes on experimenters and the tasks that they employ with regard to deception. For a participant taking part in an fMRI study, inside the bore of the scanner can be a dark, cold, and noisy environment. Distortions caused by body motion inside the scanner are

common, and a great deal of time is spent making participants feel comfortable inside the scanner and training them to remain still throughout the experiment. Participants will usually be asked to make push-button responses on button boxes at their sides rather than speak, as the movement of the tongue and jaw (as well as air over the vocal chords) will introduce distortions into the scanning data because it upsets the carefully controlled magnetic fields within the scanner.

The types of experiments employed in fMRI studies vary greatly in terms of the scenarios in which the experiments are set. Some might employ a mock-crime scenario, in which one must plead innocence either truthfully or deceptively about a staged crime that was enacted prior to the scanning session; others might ask participants questions as to the nature of potentially embarrassing autobiographical information; and some experiments employ emotionally neutral information concealment scenarios, such as lying about a playing card in a hand of cards. Clearly these experimental scenarios will vary in their stakes—the risks or rewards associated with successful deception—as well as the extent to which they induce feelings such as fear of being found out or guilt.

Another important consideration with regard to experimental deception research (and fMRI experiments fall into this category) is the fact that deception is often “sanctioned” by the experimenter; after all, in the vast majority of experiments, participants are told when to lie and when to tell the truth. It is argued that a core feature of deception is that it is rarely, if ever, consented to or endorsed by the victim of the deceit.

Observations such as these have raised concerns over “ecological validity,” or how representative of everyday deception such experimental scenarios may be. This is of major importance once results from laboratory studies are translated to situations with serious consequences, such as within the judicial system or for use in clinical settings. For this reason, numerous researchers advocate carefully designed “clinical trials” before such technology can be considered credible in a court of law.

### Current and Future Uses of the Procedure

As indicated above, current understanding of how the brain shapes deception is based largely

*Duke University Medical Center researchers utilize functional magnetic resonance imaging (fMRI) to determine how a certain brain region drives selfish or unselfish motives. The technology has also been used in deception detection experiments, but it has limitations that have raised concerns over its validity.*

on studies with relatively low ecological validity, but as progress is made in designing experiments that are more similar to the types of deception seen in everyday life, a fuller and more detailed picture of the cognitive neurobiology of deception will emerge.

Researchers have been employing fMRI techniques to help understand the neural correlates of deception for over a decade, and already a number of companies have marketed fMRI lie detection technology based on such research, trying to establish an alternative to the polygraph. As noted above, a willing and compliant participant is crucial for current fMRI procedures in order to offer accurate pictures of brain activity, while research has recently illustrated fMRI lie

detection could potentially be rendered useless by a relatively simple countermeasure training process; thus, some fairly fundamental obstacles must be overcome before such technologies are ready for widespread use.

The technology of fMRI has been revolutionary in terms of understanding how the brain functions, and research on deception using the technology has greatly increased insight into this fascinating phenomenon. Given the potential impact of lie detection using fMRI technology, experts have begun to carefully consider the ethics and implications of such technology and whether fMRI-based lie detection is truly possible.

# G

## Games, Children's

Children's games provide many developmental benefits in addition to offering recreational and entertaining experiences. Lying and deception play key roles in many types of children's games, with the opportunity to deceive one's peers an important strategy for defeating opponents and winning the contest. Some believe this exposure to lying and deception plays a role in adult reaction to such behaviors, while others maintain that the vast majority of children appreciate the lack of veracity required as part of the game. Few studies specifically examine how lying in games affects players' later socialization or actions.

### Background

"Play" has been defined in various ways. Most definitions, however, indicate that it is an activity that is engaged in both for its own sake and for the purpose of participating in the process of the play. While "winning" is often highly desired, in and of itself it offers few if any benefits to the child other than the ability to say one has bested one's peers. Such a definition contrasts play with exploration, which may occur when a child receives a new toy or other plaything.

Play is sometimes categorized into various types, including exercise play, object play, physical play, pretend play, and sociodramatic play.

Exercise play begins when children are toddlers, peaks at the early elementary school grades, and then decreases. This type of play involves periods when a child is running around and being active; exercise play is posited to assist with the physical training of muscles while also encouraging breaks from cognitive tasks. Object play begins in infancy and is thought to assist children in developing problem-solving skills, as studies have demonstrated that allowing children the opportunity to play with an object has as much impact as instruction when the same children are later asked to solve a problem. Physical play involves gross motor activity, such as those movements that include climbing, jumping, running, or other large muscle movement, including play fighting and chasing. Pretend play begins in children as young as 15 months old, often entails such behaviors as putting a stuffed toy "to bed" or feigning sleep, and is often first modeled to children by adults. Sociodramatic play involves social interaction with others and can often involve sustained role-playing along a narrative line. Sociodramatic play is often engaged in by children 3 years of age and older. Each type of play is important and sometimes evolves into games, which are essentially play with rules.

Children's games are those in which children play with some sort of goal or objective in mind. Although games are often taught to children by

their parents or other older individuals, sometimes children create the games on their own. Some games are unstructured, involving natural play and few rules, and are based chiefly upon imagination and fantasy. Other games are highly structured and are organized with set rules and definite goals and objectives. In ancient Greece children are known to have played a primitive form of jacks, with children tossing and catching five or more jackstones. Games such as swings, blindman's bluff, and a chase game in which teams of children would take turns chasing the other depending upon the toss of a coin, all existed 2,000 or more years ago. Games evolve to represent the cultures in which they are played. Certain games that were once popular, such as those that involved violence toward animals, have disappeared and been replaced by other, more socially acceptable alternatives.

Many types of games have traditionally involved balls or other objects that are thrown, caught, and used to rack up various types of scores if placed in a certain position. Technology has impacted the development of games and often changed how they are played. For instance, the discovery of rubber led to the production of balls made out of that substance. This new type of ball consequently led to an increase in the number and variety of games played with balls. Increasing trade between various nations also has changed the types of games with which children play; after Marco Polo opened trade with China, for example, kites became common in Europe for the first time. More recently, advances in computer and video technology have led to the development of many electronic games, which in turn has changed how some interaction with older games occurs.

Playing games is often perceived as a training exercise through which children develop skills that are useful in other spheres of their lives. Differences exist between child-created and officially sanctioned sports. On one hand, games children develop on their own often emphasize the need for little preparation, less specialized equipment, and any convenient playing area. Most sanctioned games, on the other hand, have fixed rules, specific equipment, and require carefully laid out playing spaces. The games children develop on their own often involve a great deal of catching,

chasing, and running, while variations of basic games that involve few resources, such as hopscotch, jump rope, and marbles, are popular throughout the world and across cultures. Certain games are played by both adults and children and include those that focus on guessing, strategy, coordination, and quizzes.

Although ubiquitous today, manufactured games date only from the 17th century. These games originally were intended as a means of instructing children on certain knowledge and information believed to be useful, and some of these evolved into games that are still used today. For example, map games that had children attempt to assemble wooden cut-outs of various countries led to the development of jigsaw puzzles and other similar games shortly thereafter. Prominent critics of games such as cards and billiards often criticized those pastimes that did not have some educational component that would illuminate or uplift those engaged in such play.

The first board game sold commercially, *The Mansion of Happiness*, was introduced in 1843 and was inspired by Christian views on morality, with players encountering various vices and virtues before ultimately reaching the Mansion of Happiness at trail's end. Many games that were first sold during the 19th century, such as *Authors*, *Chinese Checkers*, *Parcheesi*, *Snakes-and-Ladders*, and others, remain popular today. During the 20th century, many board games were introduced that became popular, including *Monopoly*, *The Game of Life*, *Clue*, *Risk*, and others. During the 1970s, war games, which were usually played by adults, became highly popular, as did *Dungeons & Dragons* as well as other role-playing games. Many games require some sort of lying or deception on the part of the players, and some believe that this behavior has long-term consequences for children who engage in such pastimes.

### **Deception as a Strategic Part of the Game**

Games can be based upon a variety of rules and ways of winning. Some games are based upon pure chance (such as rolling a pair of dice), pure strategy (chess), or a mixture of the two (poker or *Monopoly*). Most games involve this combination of both luck and strategy, although the precise mixture of luck or randomness as opposed to

skill involved varies greatly from game to game. A child playing Snakes-and-Ladders, for example, needs to make no decisions, as luck alone controls the pace and course of the game. Other games, however, such as Risk, involve a combination of skill and luck—a few poor die tosses will impede the play of any individual, but over many games the more skilled player will win more often than his or her less skilled counterpart.

The amount of game information available to players also heavily influences how a game is played. Games such as chess are sometimes referred to as “perfect information” games—each player has complete information regarding the state of the game at any given moment. Other games, such as poker, hide a certain amount of information from each player. While he or she can surmise certain information based upon the cards in his or her hand and knowledge of the cards already played, certain information is known only by the other player. This makes an ideal situation for one or more players to lie or “bluff” regarding the cards in their hands. While knowing only partial information about an opponent's hand makes determining the best move more difficult, it also assists the players who estimate the probabilities of certain possibilities, a skill that has value in other areas of life.

Some games also require the players to negotiate with each other, forcing them to use diplomacy in order to achieve a situation that is mutually advantageous. In Risk, for example, a strategic game in which players compete for world domination, two or more participants may choose to team up against one or more opponents. As a result, a major aspect of the game is convincing other players to join with him or her as opposed to others. More sophisticated games in which players engage in such negotiations, such as Diplomacy, sometimes require the making of complicated and sophisticated plans, and players must be wary of the possibility of betrayal. The skills of diplomacy may be combined with chance, as in those games in which players must also throw a die or dice or draw cards from a deck to determine their next move. Certain role-playing games require players to roll some sort of a counter to determine how a certain character fares in battle, and in some of these contests a player may engage in deception of some or all of the other players.

### **Effect of Engaging in Games on Players**

Socialization is the process through which children gain the knowledge, practices, standards, and values of the communities into which they will eventually become members. Enculturation is a two-way process, with adults certainly transmitting certain values and traditions to younger members of the group, but with children also playing a fundamental role in shaping their environments. Innate differences between different children in the same community, such as varying perceptions of their intelligence, temperament, and physical attractiveness, all play a role in children's enculturation. A child's socialization, however, is also influenced by those activities in which a child engages. As a result, some studies have explored how games that demand the players engage in lying or deception influence the development and perceptions of children who play them.

Some developmental psychologists believe that games influence children's cognitive and social development. This influence is perhaps greater for boys, whose facility with games focusing on balls or chases often is a strong predictor of their social competence with classmates. Playing games allows children to develop their cognitive and social capacities, and most children express pleasure when playing games, often choosing to engage in them in preference to other activities. Games require children to be knowledgeable about the rules of a game and to subordinate their own desires and opinions to the rules and their peers' positions in the game.

Children who are highly facile at games tend to become game leaders and play a dominant role in determining when games begin and end, as well as negotiating disagreements that may arise. Children who are less able to engage in tasks that involve lying and deception are frequently assisted by game leaders, who provide scaffolding and other support to help the less facile players obtain their goals. Children's ability to succeed at games played with peers often impacts their sense of efficacy with regard to overall school performance.

The ability to engage in deceptive behavior in games appears to also be correlated to a child's ability to engage in constructive relationships with teachers, parents, and other authority

figures. Leadership in chase and ball games often leads to leadership roles in the classroom for boys, but girls, who are more likely to engage in verbal or board games, do not see a similar transfer in leadership from games to the classroom. While a number of studies have been conducted on older games, such as chess and mancala, which show that knowledge of the game rather than anticipation of an opponent's possible moves most influence play, little research has been conducted on more modern board or role-playing games. As a result, little is known about how a player's facility with lying and deception affects the final results of a game.

## Generalized Communicative Suspicion

Generalized communicative suspicion (GCS) is a predisposition toward believing that other people's messages are deceptive. GCS is conceptually different from state suspicion. A valid instrument was built to measure GCS. Contrary to expectations, GCS scores are not consistently related with deception judgments.

Generalized communicative suspicion was first defined by Timothy R. Levine and Steven McCornack, who established a distinction between GCS and situationally aroused (or state) suspicion. GCS was described as a predisposition toward believing that other people's messages are deceptive. It was conceived as a relatively enduring personality trait. On the contrary, state suspicion is aroused by situational cues that suggest that in a particular context, at a particular time, a particular communication of a particular person may be deceptive. Unlike GCS, state suspicion is transient. While GCS depends on the person, state suspicion depends on the situation.

Levine and McCornack created a scale to measure GCS with 14 Likert-type items. Several validation studies have been conducted. On most occasions, some items have been removed because of low-factor loadings, high cross-loadings, or a small contribution to total-scale reliability. The final scale has been shown to measure a unidimensional construct, with Cronbach's alpha ranging from 0.71 to 0.82 depending on the particular study. The GCS scale has significant positive correlations with related constructs, such as lie acceptability, cynicism, negativism, and verbal aggressiveness, as well as significant negative correlations with trustworthiness, interpersonal trust, specific trust, and locus of control. The correlations are not as high as to suggest that the construct being measured is the same. These correlations make sense theoretically and support the construct validity of GCS. The original English-language scale was translated into Spanish (11 items, alpha equals 0.82) and German (with alphas ranging from 0.77 to 0.85).

*A West Midlands, United Kingdom, police officer gives a driver a breathalyzer test as part of a drunk driving crackdown in 2010. Police officers are repeatedly exposed to suspicion-arousing situations in which distrust is the norm, which may increase their tendency toward generalized communicative suspicion.*

Research has shown that state suspicion significantly increases the tendency to judge other people's messages as lies. GCS should have a similar effect; specifically, in comparison with low-GCS individuals, high-GCS individuals should have a stronger tendency to judge other people's messages as lies, or they should at least react more strongly to increases in state suspicion. Several studies have examined these issues.

Levine and McCornack showed that moderate- and high-GCS individuals were more likely to make deception judgments (judging the incoming messages as lies) than low-GCS individuals. This effect held when controlling for state suspicion. Additional analyses revealed that GCS and state suspicion influenced deception judgments in a nonadditive manner. Subsequent research, however, yielded less positive results. Another study by McCornack and Levine showed that whereas

state suspicion significantly influenced the number of deception judgments, neither GCS nor the GCS times state suspicion interaction did.

### **Studies of Prisoners and Police Officers**

Prisons are contexts in which situational suspicion is aroused. If people high in GCS are particularly sensitive to situational suspicion, then high-GCS inmates should make more deception judgments than low-GCS inmates. However, two studies conducted in U.S. prisons found no significant relation between inmates' GCS scores and their deception judgments. Perhaps the high level of state suspicion in prisons overshadows the influence of GCS; however, an additional study with both prisoners and nonprisoners found that (1) the former tended more strongly than the latter to make deception judgments, (2) prisoners had higher GCS scores than nonprisoners, yet (3) GCS scores did not predict deception judgments. Together these findings cast doubt on the usefulness of the GCS scale to predict deception judgments.

A separate line of research with police officers also points in this direction. Officers are often involved in suspicion-arousing situations in which distrust is the norm (for example, interrogations). Over the years, repeated exposure to situations of this kind might increase police officers' generalized suspicion, so that experienced officers may end up believing that people normally lie. This would explain why, when judging veracity, officers primarily search for evidence that the communication sender is lying and make more deception judgments than nonofficers.

Two studies conducted in Spain revealed that, as expected, veteran officers had higher GCS scores than both novice officers and college students (which did not differ). This shows that, as predicted, experience as an officer results in greater GCS and rules out the possibility that distrustful individuals tend to join the police force more readily than less distrustful individuals. In the second study, veracity judgments were examined in addition to GCS. Both veteran and novice officers displayed a significant tendency to make deception judgments, whereas students tended to make truth judgments. However, unexpectedly, no correlation was significant between GCS scores and deception judgments, neither across all

three samples or when considering each sample separately.

A more recent study conducted in Switzerland found that students and police recruits were more concerned about misjudging truths as lies than about misjudging lies as truths and tended to make truth judgments, while police officers were equally concerned about misjudging truths or lies and were neither truth nor lie biased. The correlations between GCS and error weighting (concern about misjudging truths versus lies) and deceptiveness judgments were significant in the students' sample but not in either police sample. However, in regression analyses in which error weighting, age, and GCS were entered as predictors of deception judgments, the effect of GCS was not significant for either sample. Thus, evidence in support of a link between GCS scores and deceptiveness judgments is, at best, mixed.

Researchers have also examined the influence of GCS on other measures. GCS has been shown to increase the intensity of emotional reaction to discovered deception among women. Specifically, among high-GCS individuals, women reported experiencing more intense emotional reactions than men after discovering that a friend or relational partner had lied to them. No sex difference emerged among low-GCS participants. Finally, in a study examining people's trust in the police, it was predicted that relative to low-GCS individuals, high-GCS individuals would show higher trust in officers who make a deception judgment. However, the correlations between GCS scores and trust were not significant.

## Conclusion

The conceptual distinction between GCS and situationally aroused suspicion is valuable, and the GCS scale has adequate properties and construct validity. However, studies conducted in several countries with college students, prisoners, and police officers question the value of GCS scores to predict deception judgments. GCS does increase emotional reaction to discovered deception among women but is unrelated to error weighting and trust in the police following a deception judgment.

## Glass, Stephen

In 1998, while working as journalist for *The New Republic* (TNR) and freelancing for other publications that included *George*, *Harper's*, *Vanity Fair*, the *New York Times Magazine*, *The New Yorker*, and *Rolling Stone*, 25-year-old Stephen Glass was found to be guilty of constructing a web of lies that had propelled him to the top of his field. Glass has since said that his deception began with making up a quotation to add a spark to an existing story, spread to coloring his articles with made-up details, and eventually grew to encompass stories made up entirely of whole cloth.

Glass knew how to get past fact-checkers at various publications because he had begun his career at TNR in that department. His deception was so complete that he invented official-sounding organizations and prepared fake notes of meetings that never took place. To bolster his stories, he provided phony letterheads, newsletters, business cards, and phone numbers, and even made up a fake Web site on his office computer. The discovery of Glass's fabrications sent TNR and all of the other publications for which Glass worked scurrying to check his "facts." TNR subsequently discovered that Glass had fabricated all or parts of 27 of the 41 stories written for the magazine, which had a nine-decade-long history of coming down hard on others for any missteps.

Years after the scandal involving Stephen Glass came to light, his name continues to be synonymous with lying in journalism. While his supporters believe he has accepted blame for his actions and reformed his character, his detractors continue to cast doubts on his reformation. Some observers believe that not all the fault for his deception lies with Glass himself. They point out that his deception was a response to the New Journalism in which writers are rewarded more for presenting a colorful story than for presenting actual facts. Psychologist Robert Reich has identified Glass as a "primary liar," one who lies to recreate a new sense of identity in order to make himself or herself look better in their own eyes. Journalist Chris Jozefowicz insists that Glass's editors and readers must also accept a share of the blame because of their thirst for sensational stories that go beyond a simple reporting of facts.

### Operation Broken Glass

The story that finally brought down Glass's web of deception was "Hack Heaven" (*The New Republic*, May 18, 1998), which described a greedy, youthful hacker who was being paid huge amounts by Junkt Micronics to refrain from destroying the company. The story sent up red flags for Adam Peneberg, the editor of the Forbes Digital Tool Web site, who was well versed in the world of hacking. After finding that none of the so-called facts in the story were verifiable, Peneberg contacted Glass's boss, Charles Lane. After intense grilling and being informed that security cameras could be produced to prove whether a fictional meeting had ever taken place, Glass confessed to his lies. When he was discovered trying to delete the fake Junkt Web site from his computer, he was fired.

*The New Republic* publicly acknowledged Glass's deception in its June 1, 1998, issue and apologized to its readers by announcing that starting in 1995 and continuing until he was fired, Glass had engaged in a pattern of fabricating details to embellish stories that eventually led him to turn out fiction rather than stories based on investigative journalism. The publication launched Operation Broken Glass to reexamine each fact provided in articles that Glass had written for TNR.

Some of the most blatant lies offered in Glass's TNR articles concerned an exposé of vendors in Rockville, Maryland, who sold political novelty items inspired by Monica Lewinsky, the White House intern who had had a sexual relationship with President Bill Clinton ("Monica Sells," April 13, 1998); a conservative plan to bring down Clinton ("Plotters," February 23, 1998); and an evangelical church that worshiped former president George H. W. Bush ("Peddling Poppy," June 9, 1987). Glass had even lied about DARE, the school drug-prevention program, and the organization filed a \$10 million libel suit that was eventually settled out of court. John F. Kennedy, Jr., the editor of *George*, personally apologized to Vernon Jordan, a Clinton aide whom Glass had falsely accused of lascivious behavior toward young women.

Rather than accepting responsibility for his own actions, Glass tried to shift the blame to his parents. He insisted that he had spent his entire life trying—and failing—to please his physician father and nurse mother, both of whom were

disappointed in him for being unable to succeed in his medical studies at the University of Pennsylvania. In 2000, Glass graduated magna cum laude from Georgetown University's Law Center. However, after passing the New York bar exam, it was made clear that he was unlikely to be accepted as a member of the New York State Bar because of doubts about his character.

### A New Start

Rather than fighting for admittance, Glass moved to California, seeking a new start. He met with similar results, but this time he chose to challenge the state bar, appealing the case all the way to the California Supreme Court. His supporters included 22 psychiatrists and law professors. Many remained unconvinced that Glass had changed. Carol Langford, a law professor and ethicist at the University of California at Berkeley insists he is a pathological liar. While awaiting a decision, Glass continued working as a paralegal.

In 2003, when Glass surfaced by fictionalizing his own story in *The Fabulist*, for which he received about \$200,000, he was soundly criticized by other journalists for again profiting from lying to his bosses, his colleagues, and the American public. Glass's deception was also fictionalized in the film *Shattered Glass*, which appeared that same year, with Hayden Christensen portraying Glass. On the positive side, the deception perpetrated by Glass caused both journalists and editors to accept more responsibility for checking facts before they are published.

## Goffman, Erving

Sociologist Erving Goffman was born in Mannville, Alberta, Canada, on June 22, 1911, the son of immigrant Ukranian Jews. His father, Max, was a shopkeeper, and his mother, Anne, was a homemaker. Goffmann received his education in both Canada and the United States, earning a B.A. at the University of Toronto in 1945, and then attending the University of Chicago, from which he received his M.A. in 1949 and his Ph.D. in 1953. Goffman became a full professor while employed at University of California, Berkley, in 1962 and became the Benjamin Franklin Professor of Anthropology and Sociology at the University of Pennsylvania in 1968.

He married Angelica Choate in 1952, and his only child, Tom, was born in 1953. Goffman became a widower in 1964, when his wife, after years of struggling with mental illness, committed suicide. Goffman's prolific writings resulted in 11 books, numerous articles, and the posthumous publication of his 1982 presidential address to the American Sociological Society. He never personally delivered this speech because of his battle with stomach cancer, which resulted in his death in Philadelphia, Pennsylvania, on November 19, 1982.

### Goffman on Self-Presentation

Goffman is one of the top 10 most frequently cited social scientists. His work displays a unique view of the world that is of particular importance to those interested in lying and deception. Woven

throughout all of his work is the perspective that people present themselves in particular ways to adjust to the demands of society and the social situation; people do not necessarily represent their real selves, but in each particular situation present specific social roles. This perspective offers extensive potential for the examination of lying, deception, secrets, and impression creation and management.

Goffman's first and most acknowledged book, *The Presentation of Self in Everyday Life* (1959), for which he received the MacIver Award from the American Sociological Association, is most illustrative of his ideas about the presentation of self. In this book he described everyday life via the metaphor of the stage, delving into concepts such as front stage, back stage, and props, all related to the main purpose of individuals in particular microsocial systems of interaction—the endeavor to present a particular positive image, that is, social role, to others. Goffman used the metaphor of the stage, setting scenes, and playing particular roles, as an apropos comparison to social interaction. He recognized the similarity between fictional presentations on the stage and the impression management individuals continually partake of in their everyday lives.

This theme is continued throughout his publications. In *Stigma: Notes on the Management of Spoiled Identity* (1963), Goffman discusses how stigmatized individuals are expected, by societal standards, to ease the tension of the “normals,” that is, individuals not stigmatized in a particular social situation. This text also discusses how the “discreditable,” that is, individuals who at any point in time may be revealed to be stigmatized, manage to control information so as to not alert normals to their stigma.

The book addresses the impressions individuals attempt to create in others' minds. For example, one method a discredited individual uses to ease tensions in normals is to present himself or herself as a “very good” sort of stigmatized person, for example, a very nice, very educated, very erudite, and very sophisticated pedophile. Discreditable individuals present themselves as normal, not admitting or leaking information, so as not to alert normals their real stigmatized societal status. Stigmatized and discreditable individuals present a social self that is other than the real self;

they attempt to create positive impressions in others' minds.

The presentation of self might be better labeled the presentation of selves, for it is the various selves one might present wherein the question of lying and deceit looms large. In some instances, it is a question. Is it lying or being socially polite to tell a woman “You look great in your new dress” when she doesn't? Situations like this or instances in which people hide their discreditable nature by not offering discrediting information give rise to the question of when lying and deceit actually begin. It is clear that when a man claims to be a medical doctor and is not, he is lying. But the question many have asked after examining Goffman's works is at what point presentation of self impression becomes creation and management, deceit, and/or lying? In many instances, there is no clear demarcation between honesty and deceit.

This theme of self and the impressions individuals socially manage illustrates the human ability to adapt to communicative social contexts, and individuals' ability via pretense, avoidance, secrets, or deceit to manipulate others' perceptions. This is why many researchers refer to the presentation of social roles as putting on a mask; they see this human ability as deceptive versus polite, socially appropriate, or mere sangfroid. Thus, much of Goffman's work is perceived as a way to study how individuals deceitfully manipulate others. Whether it is an everyday situation in which society demands that an individual express politeness rather than the furious anger he or she may feel, or if it is a swindler in the midst of a scam, individuals need to portray a consistent rendition of a trustworthy self to others. Hence, Goffman provides an all-abiding theoretical construction by which to study forms of lies, deceit, and misrepresentation.

## Gossip

Gossip is a name commonly given to certain ways of talking about human affairs, whether the talk is retrospective, contemporary, or anticipatory. Gossip exists in private life and public life, in whispers between friends and headlines in magazines. There are gossip columns in newspapers, gossip television programs, and entire magazines devoted to gossip, a form that is referred to as societal gossip. Yet gossip may also occur among schoolmates at recess, among co-workers at a water cooler, or between riders on a bus, all of which is called collegial gossip. In addition, the burgeoning dominance of digital communication bring rise—albeit in a cursory fashion—to virtual gossip. Gossip covers such a broad range of speech that it is impossible to fully mark its territory.

Gossip occurs along a continuum that offers a blend of two things to the group engaged in it: conviviality and compelling content. As an example of one extreme, pure conviviality, a group of closely bonded women knit while talking enthusiastically about the best way to replace missing buttons. At the other extreme, where content is compelling, two men talk about a neighbor's sex life.

The topics of gossip are typically exciting, drawing in listeners and often causing them to enter a highly energized participatory ritual in a state that sociologist Randall Collins calls "entrainment." In gossip sessions, speech is rapid, interrupted, intense, and generally invigorating. The sense of bond between gossipers can be intense, and this force also drives the practice of gossip.

The rigors of authoritative tale-telling (verifiability) came, for the most part, after the invention of

writing. Gossip functions much like entertainment and may be the earliest form of it through enchantment, the artful weaving of the other's imagination through speaking. Medieval troubadours traveled from village to village engaged in a musical gossip mongering, shortly followed by Boccaccio's *Decameron* (1350) and Chaucer's *Canterbury Tales* (1475), both of which mirror the tale- and gossip-telling of the people of their era. Even the famous poem *Rape of the Lock* (1712) by Alexander Pope is, effectively, gossip, and it would be no stretch to detect a regular gossiping disposition in that poet, his foils, and his contemporaries. Certainly, there are gossip-like characteristics within folktales, legends, and even myths.

### Characteristics of Gossip

Gossip can be regarded as a performative art. In particular, the speaker of gossip performs the role of expert upon a given topic, the one universal characteristic of gossip. Gossip does have other characteristics, which vary from one performance to another; in particular, it fails to achieve the minimal expectations for warrantable speech about human affairs. Thus, gossip is speech that is some combination of the following: uninformed, unsayable, unverifiable, trivial, and lacking in accountability.

Where the speaker lacks substantial knowledge of the human affair discussed, the speech may be gossip because it is uninformed. For example, neighbors with no facts speculate about imminent construction in the neighborhood.

Where speech is unsayable, it may be gossip for a variety of reasons. Sometimes the speaker is unpermitted to speak on the subject and doing so gossips. This might occur when a man reports of stresses in a neighbor's marriage. When the speech is directed at people who should not be hearing it, it is indiscrete and often thereby gossip. For example, when a woman who laughingly describes, to her new boyfriend, the intimacy challenges faced by her last boyfriend, she is being indiscrete and therefore gossiping. Unsayability also governs speech that is unrespectable, the sort that upright people refuse to speak and refuse to hear, including content that is gathered illicitly or accidentally (e.g., "guess what I saw through my neighbor's window"), is speculative (e.g., "I bet she's the kind of girl that would . . ."), is injurious

to reputation (e.g., “you know he drinks heavily”), or is outrageous (e.g., “he is 45 and still wets his bed”).

Where the content of speech cannot be supported by other sources and evidence, it is unverifiable and therefore gossip or likely to be gossip. A group of neighbors discussing what goes on in the house with the darkened windows is likely to be gossiping unless they have means to gather information that supports their claims.

Gossip that principally bonds people tends to focus on trivial content. Thus, convivial gossip often focuses on trivia in sports, popular music, domestic activities, and so forth.

Speaking carries an ethical burden that magnifies coordinate with its content. Where speech lacks accountability in advance or after the fact, the speech may be regarded as gossip. A man who tells friends that a neighbor has a drinking problem based only on the time that person gets home is not speaking responsibly. Should it be later learned that the charge was both untrue and based on this weak evidence, the speaker may also be regarded as a gossip for irresponsibly making the original claim and shirking any duty to admit wrongdoing.

### Motivation to Gossip

Access to gossip is a profound sign of inclusion in groups; thus, the motivation to gossip is often peer driven, much like an adolescent's motivation to drink alcohol or smoke cigarettes. Conviviality thus plays an instrumental role in gossip activities. Both the O. J. Simpson murder story and the President Clinton/Monica Lewinsky scandal were topically compelling, but they also advanced because of their effects on conviviality (i.e., the racial and political bonding and unbonding that occurred where the stories were popular). In general, motives to gossip are unconscious because gossips are only by degree aware of the meaning of their actions. Thus, gossip may be nonthematized, unconscious, spontaneous, or planned.

Not all gossip is preceded by a mental decision to do so, nor is it all followed by an awareness that it was done. Much of the time it occurs unreflectively in a nonthematized fashion—it just pops out, partially because of the company, the circumstances, or the direction of the conversation. This is true both for convivial gossip and

reportorial gossip. This was the sort of gossip used by Mrs. Bennet and Miss Bates in Jane Austen's *Emma* (1815).

The intent to gossip can also be motivated by forces that are deeper than conscious judgment, what various theories regard as unconscious motivation, such as Freud describes in *The Psychopathology of Everyday Life* (1901). It is possible, for example, to feel envy for another without consciously knowing it and to do ruinous damage to that person through just letting something accidentally slip out, as the saying goes. In such a case, however, the argument of unconscious motivation would say, as did Freud, that there are no accidents.

Like an impromptu speech, gossip can arise from a spontaneous decision. When this occurs, the gossip talk momentarily deliberates on the possibility of gossiping and then decides to go forward. The moral significance of this decision varies according to the type of gossip delivered. Sometimes it is relatively harmless, as in Season 3, episode 21 of *Seinfeld*, when Elaine and George, as a way to relieve the awkwardness of being alone together, spontaneously gossip about the way Jerry gargles; the viewer's outrage is minimal because the gossip is trivial. On the other hand, in a case of malignant gossip, to reflect even momentarily in advance that the subject of the gossip could be damaged by it, and then to continue with the gossip regardless, is to engage in a morally offensive act.

If gossipers take their time, hours or days in advance, organizing or meditating upon the gossip, the gossip is planned. This organizational quality eliminates any opportunity for the gossip to reasonably later claim that the act was incidental in a manner that might minimize its perceived intent, as does the carrying of a gossip story from group to group, occasion to occasion. Such gossip may be social, collegial, or virtual. Where it harms or could harm, it is a deliberately ruinous act.

In the case of virtual malicious gossip, there are cases of adolescent suicide because of such planned attacks. This is grimly illustrated in the case of Rehtaeh Parsons, who attempted suicide—and later died—after online photos appeared of her being gang raped 17 months prior, in November 2011. The same phenomena can be viewed at

the other end of time, such as in the ancient tale *Psyche and Eros*, in which Psyche's sisters plot to destroy her and her relationship.

The damaging effects of planned gossip are so precise that a polished saboteur, well-studied in this form, can use it to control not only who is damaged but even the quality and degree of damage. Carefully selected gossip can make its subject appear ridiculous ("he has a toupee"), immature ("he picks his nose"), stupid ("he failed the same test twice"), weak ("he begged her to take him back"), inadequate ("they say he's impotent"), uninteresting ("he jabbers on and on"), dangerous ("I heard he hit his last girlfriend"), and so on. Such comments, true or not, can have remarkable and predictable outcomes. But not all gossip that is planned in advance is motivated by a will to harm, as seen more clearly in the examination of gossip types.

### Gossip Types

Gossip types must be recognized because the term *gossip*, by itself, leaves too vague an impression of what has been done. An illustration is the gossip conversation in the song, "Ode to Billy Joe" (1967) by Bobbie Gentry: "Billy Joe McAllister jumped off the Tallahatchie bridge" (verifiable and informative gossip); "Well, Billie Joe never had a lick of sense" (malignant gossip); "Mama said it was a shame about Billie Joe, anyhow" (compassionate gossip); "Nothing ever comes to no good up on Choctaw Ridge" (judgmental gossip); "Brother said he recollected when he and Tom and Billie Joe put a frog down my back" (nostalgic gossip); "Wasn't I talking to him after church last Sunday night?" (investigative gossip); "I saw him at the sawmill yesterday on Choctaw Ridge" (benign gossip); "He said he saw a girl that looked a lot like you up on Choctaw Ridge, and she and Billie

Women gossiping in a Washington, D.C., drugstore over cigarettes and cokes in 1943. The speaker of gossip performs the role of expert upon a given topic, the one universal characteristic of gossip. As another key characteristic of gossip is that it fails to achieve the minimal expectations for warrantable speech about human affairs, gossip therefore is some combination of the following: uninformed, unsayable, unverifiable, trivial, and lacking in accountability.

Joe was throwing something off the Tallahatchie Bridge” (repeated and investigative gossip).

Although the song is well known, few listeners will have thought of the lyrics as gossip, and fewer will have parsed the types of gossip despite the uncountable times they heard it. Most listeners have considered it a song about Billy Joe, or perhaps the singer, focusing on gossip’s content rather than its presence as a speech form. This is what often happens to gossip: The content becomes the focus, not the discursive form.

There are many other varieties of gossip. Variation of type can occur from sentence to sentence, as in the song, yet any one type can form the entire theme of a gossip ritual. Benevolent forms of gossip might include honoring gossip, idolizing gossip, compassionate gossip, and hopeful gossip. Harmful forms of gossip might include salacious gossip, contemptuous gossip, humiliating gossip, malignant gossip, and malicious gossip. Such terms represent possible descriptors for a gossip event and should not be used to establish a nosology; rather, they suggest that gossip should always be identified in at least a two-word form and that the person judging it should seek the most representative descriptor for the occasion.

Both benevolent gossip and harmful gossip can be performed strategically and as lies, which can harm the subject of the gossip.

### Lie Gossip

Where gossip is untrue, it is not always a lie. One can gossip untruths because one is in error, as occurs when one listens to and repeats false reports or comes to erroneous conclusions based on insufficient evidence. One can also be in error because circumstances change between the moment the gossipier gathers content and the moment that content is reported to others.

Gossip can also be untrue because it is embellished. In such cases, the gossip adds more to the story than the facts will support. This occurs when the gossip fabricates to weave together discordant story elements or to respond to audience comments. Embellishments can also occur to make the story (and its teller) more compelling, thereby heightening audience attention and interest. Embellishers may not fully intend to lie—they may simply get caught up in the story, be trapped in an awkward question, and so forth.

Gossip can also be untrue because the gossipier has decided to lie. Such lies run the gamut from harmless fibs to libelous falsehoods. In all such cases, lie-gossip is clearly a deliberate attempt to misrepresent. Planned, malignant gossip (gossip intentionally organized and delivered to bring harm) can be true, but it can also be a lie. Where gossip plans to bring harm through lying, the act is compoundedly heinous, because lie gossip—as a way of unjustly manipulating the status of others—amounts to status theft. In matters of law, the term *libel* is used to describe malicious gossip that exploits lies to cause its effects.

Aspersions to malign steal or ruin the social world’s most profound gifts: the status, opportunities, trust, friendship, and love that rightfully belong to the gossipier’s victim. Those who gossip in this manner are therefore ruiners, and when they ruin by lying in their gossip, they are thieves. In the middle ages, this tendency was a well-known vice with its own term, *peccatum derisionis*, which was regarded as the most grievous of offenses because it robbed a person of deserved honor or respectability, so important wherever one’s word was one’s bond.

The concept remains valuable in modern times, such as in embellished malignant gossip. At a collective workplace, for example, a man describes the comings and goings of an attractive co-worker who lives in his apartment building. To give the others present a sense that he has profound knowledge of this woman, he embellishes his tale, saying that she has a “revolving front door” where men are concerned. This gossip is malignant in that at the very least, it damages her reputation at work. Under any circumstances it would be morally problematic, but it is particularly heinous when it contains untruths that sacrifice the victim’s integrity for the sake of the gossip’s in-group status. By extension, if the gossip comments were made strategically to damage the woman’s status at work, then it would be lie-gossip of a distinctly malicious form.

Because gossip is performative art, it can also be examined in terms of associated deceptive behavior. In particular, the speaker can act (through gesture, tone, word choice, pauses, etc.) as if it was warrantable speech—as if the speech was informed, permitted, verifiable, discrete, significant, and responsible. Because reportorial

gossip is not all of these things, by definition, the performance can be regarded as deceptive.

### Impact of Gossiping on the Gossip

Research supports the common claim that the effect of gossip is to bring dishonor on the person who presents it. Nevertheless, not even the malicious gossip becomes an outcast. The gift-like character of gossip inhibits the tendency of the audience to take offense when it is proffered. Whereas gossip is also possible information, people are often quite interested in it and ready to pay the social price necessary to receive it. The moment they attend to the information, they fall into a conspiracy of gossip, or a gossip group, in which they are no longer in a position to cast downward glances on anyone else. In addition, the subject of the gossip is often in a poor position to retaliate, not knowing it exists or not knowing its source.

Even in cases in which the content and source are known, both justice and retaliation would require confrontation, a form of speech and action that is less well tolerated than gossip itself. Those present during situations of gossip might also fear, and wisely, the vengeful gossip outcomes that could arise as a result of standing up to a well-seasoned gossipier. Moreover, people often engage in such gossip as givers and getters without realizing they are gossiping. Gossip seldom announces itself and certainly does not identify itself as malignant or malicious, for example. As with other forms of discourse, there are few people who can function as analysts of gossip in the middle of experiencing it. Consequently, even a person who lie-gossips does so far more often and more successfully than justice might allow.

## Government, Decline of Public Trust in

Public trust in government is critical to the maintenance of legitimacy and is particularly important to the legitimacy of democratic regimes. Trust enables governing elites to enact legislation and enable mass action without having to resort to either coercion or the use of force, which historically occurs within the domain of less representative political orders. Many scholars have noted a decline in the public's trust of government within modern and postmodern democratic regimes, particularly since the mid-1950s.

Within the context of the impact of lying and deception, this decline in public trust can be attributed to two general sources. The first is lying and/or deception on the part of ruling elites and/or governmental agents and agencies, which is often used to maintain legitimacy and obscure the government's incompetent performance. Additionally, decreasing trust not only reflects public dissatisfaction but may serve to increase future dissatisfaction, making effective governance more difficult. This is compatible with the

colloquialism that “trust leaves on horseback, yet returns on foot.” Second, lying and deception that serves to influence the decline of public trust in government may be attributable to extragovernmental organizations, for example, members of the news media. How the public is exposed to the media is purported to have an impact independent of media content.

### Perceptions of Trust and Government Legitimacy

There are generally two types of trust involving perceptions of the government. The first, “specific support,” refers to perceptions of trust in regard to political elites and the degree of satisfaction with the performance of government, often referred to as the delivery of governmental services. The second, “diffuse support,” refers to the public’s attitude with regard to the political order itself, or the type of regime in power, irrespective of the perception of performance. The reasons for the general decline of public trust in government throughout the 20th century vary, with scholars implicating a decline in levels of social capital, ineffectiveness in dealing with crime, prevalence of political scandals, ineptitude at managing the economy and delivering other governmental services, in addition to shifting societal values with regard to the role of government in society.

The maintenance of trust is important to those in power—both governmental actors and organizations—in that trust is an essential component of legitimacy. Legitimacy is generally defined as “the capacity for a society to hold those institutions in power as appropriate.” Without trust, legitimacy would be necessarily and fundamentally undermined, resulting in a condition whereby ruling elites may be precluded from enacting legislation or enabling action without resorting to tactics that undermine the very essence of representative, democratic, and/or egalitarian forms of government. Thus, while the use of deception and lying is certainly not confined to representative forms of government (and may, in fact, be more prominent in less egalitarian forms of government), trust is more essential to those egalitarian forms of organization, for authoritarian regimes need not be concerned with the negative implications of coercion and force in ensuring compliance.

### Government Propaganda

Lying and deception can occur on the part of governmental agents and agencies in an attempt to enhance the appearance of governmental efficacy with regard to policies and programs. Extreme forms may be colloquially referenced using the term *propaganda*, which, despite its lack of uniformity in terms of meaning, is generally defined as “a negative form of mass communication, most commonly employed by those in power to manipulate or influence public consciousness so as to increase or maintain their position of power.” Although the use of propaganda is not confined to those in positions of power, “negative propaganda” is most often associated with authoritarian political regimes. The term *propaganda* became popularized in describing the vitriolic effort within Nazi Germany aimed at vilifying and dehumanizing the Jewish people before World War II, a campaign that catalyzed the event now formally referred to as the Holocaust.

Within the context of American society, one of the most caustic uses of propaganda surrounds the infamous Joseph McCarthy anticommunist campaigns of the 1950s, wherein innocent Americans were accused of being communist spies and sympathizers, and many unsubstantiated and unfalsifiable claims were made with regard to the impact of communism as a form of economic organization. Propaganda was used heavily during the Cold War and its many “hot war” proxies; for example, propaganda was employed by both sides during the Vietnam War. In the early 21st century, propaganda in the United States (and throughout the Western world) has been used in the nebulous war on terrorism, with the label of terrorist being applied without consideration given to the relativistic nature of the term. The sociopsychological term *Islamophobia* was coined in reaction to the ubiquity of this phenomenon.

Another example of the use of propaganda, which some social historians have implicated in the erosion of trust in government within the United States, concerns the perpetuation of myths surrounding the psychopharmacological effects of illicit psychoactive substances. Many official campaigns aimed at curbing rates of drug use have been predicated upon empirically falsified myths and have been instrumental in justifying and perpetuating the long-standing War on Drugs

in American society (and throughout the world). In this context, the U.S. government has been accused of perpetuating a number of lies to vilify both substance and user in an effort to increase punitive measures against those who manufacture, distribute, and use illicit psychoactive substances. Most notable in this context is the perpetuation of myths surrounding the purported “gateway effect” of marijuana, which, despite the concept’s popularity in government-sponsored antidrug campaigns, has received no empirical support.

### **Government Performance and Trust**

Evaluations of governmental programs with regard to their efficacy, in addition to perceptions regarding the delivery of governmental services, have received much attention in the literature with regard to their impact on trust levels. Levels of distrust increase with decreasing evaluations of the government’s ability to deal with the problem of crime and managing the economy. There is much research examining the process whereby various agencies report on crime statistics, sometimes in ways that could be characterized as disingenuous. The White House Office of National Drug Control Policy has been implicated in misrepresenting statistics, ostensibly to garner support for draconian policies aimed at curbing drug use. Additionally, perceptions of efficacy can be manipulated by oppositional political parties and their inherently biased supporters, and this partisan maneuvering impacts levels of trust and ostensibly legitimacy. Consequently, nonpartisan organizations are often called upon to gauge governmental efficacy in order to minimize partisan biases that would undermine the validity of such an accounting. In the United States, the nonpartisan Government Accountability Office was created to evaluate the expenditure of federal funds, and the comptroller who oversees its operation is appointed to a 15-year term in order to minimize the impact of political influence.

### **Trust and the Mass Media**

The effect of extragovernmental organizations on levels of public trust in government has largely focused on the influence of the mass media. All representative forms of government are dependent upon an informed electorate, and

it is important to consider the degree to which the editorial process impacts the verisimilitude of media content. Much research has been devoted to understanding the impact of specific forms of media content on levels of trust in government, such as comparing the degree to which those watching television news programs differ from those who receive their news primarily from newspapers. While studies vary with regard to the direction and power of the effect, research suggests that socioeconomic status, ideology, and societal values may interact with media format to influence levels of specific distrust and diffuse support in government.

The “video malaise” thesis asserts that distrust of the government and the media tend to covary, in that those distrustful of one tend to be distrustful of the other. Although the results of empirical research tend to vary with regard to the impact of television (and nontraditional sources of news, such as talk radio) on trust in government, some studies indicate that the effect is conditioned by pre-existing political orientation and socioeconomic status. Despite this, heavily cited research found that those who rely on televised news content are most distrustful of the government. Research has also examined the influence of political and news-oriented comedy programming, which has been found to negatively influence both trust in government and perceptions of threat with regard to national security.

### **Conclusion**

Public trust in government has been in decline throughout the 20th century. While the etiology of this decline is inconclusive, the source of this decline has been attributed to a number of factors which range from satisfaction with government delivery of services to perception of the truthfulness of official government narratives to the influence of various forms of mass media. Both governmental actors and those outside the political process have power in determining how the public perceives these issues and in doing so influence trust in government and, more broadly considered, its claim to legitimacy.

## Government Propaganda

Government propaganda is a heterogeneous concept composed of a number of dimensions that relate both directly and indirectly to deception and lying. The word *propaganda* shares a common origin with the word *propagate* (Latin: *propagare*), with the emphasis on reproducing, disseminating, or spreading something (for example, plants). Prior to the 20th century, propaganda did not necessarily connote or entail deception, as when in 1627, the Catholic Church created the College of Propaganda in Rome for

the training of missionaries to spread the message of the church. In the United States, early governmental efforts, aimed at large-scale public education, were originally referred to as propaganda by the government itself.

The rise of mass communication and the centralization of government made the institutionalization of propaganda possible in the United States and elsewhere. The intent of the early educational campaigns was often to provide information (largely accurate) to the greatest number of people, with the intention of encouraging or changing specific behavior (for example, public health) for the betterment of society; even Thomas Edison was involved in such a campaign aimed at the prevention of tuberculosis. This initial governmental approach is what has come to be called "white propaganda," and the deception was largely in the emphasis or exaggeration of the message and in the omission of detail that might distract from the message or be misunderstood by the audience.

The term *government propaganda* would have seemed redundant initially, because the government was uniquely using the word *propaganda* to refer specifically to its own educational campaigns. The changes in the meaning of propaganda have corresponded to changes in the governmental practices related to it. World War I saw the application of advertising techniques to increase support for the war effort, but toward ends that were often either not helpful to the individual or were harmful. The contemporary meaning of propaganda is now inextricably linked to and associated with deception and lying. It is also important now to call it government propaganda to highlight its distinction from other forms of propaganda.

### Definition of Propaganda

V. O'Donnell and G. S. Jowett define propaganda as, "the deliberate, systematic attempt to shape perceptions, manipulate cognitions, and direct behavior to achieve a response that furthers the desired intent of the propagandist." Deception and lying are used as the means of "shaping," "manipulating," and "directing." As suggested above, the role of deception in propaganda is on a spectrum that might include exaggeration or incomplete accounts (for example, lying by

omission) on one end, and outright lying (for example, the big lie or telling the same lie over and over) on the other. Jowett and O'Donnell developed the purpose model of propaganda that includes three levels of communication (sender, gatekeeper, and receiver), which is suggestive of where and how aspects of deception and lying might occur and be identified.

Propaganda is mediated communication and as such it involves several components: (1) The communication of a message that may be hyped, incomplete, misleading, or false but not appear so; (2) the dissemination of that message through the gatekeeper media, which provides the semblance of neutrality or objectivity; (3) the crafting of the message with the intention of influencing the thoughts, beliefs, attitudes, and/or behaviors of a particular group or receiver; and (4) persuasion or influence on that receiver that is often achieved by appealing to emotions (for example, using the affect heuristic, which involves making decisions based on one's current emotional state) or biases and misperceptions, as opposed to logical or rational deliberation. Psychologists have largely focused on the last component: the impact of propaganda on the recipient or individual.

While propaganda was originally studied as a discrete concept, psychologists today study the components of propaganda, including persuasion, influence, communication theory, media influence, attitude and behavior change, group dynamics, politics of denial, and bias. Concerns about the utilization and influence of propaganda have expanded beyond its use by governments to include its uses for ideological or commercial purposes. In particular, Noam Chomsky has highlighted the recent growth of corporate propaganda, which he argues has often supplanted or has been integrated with government propaganda to protect or promote corporate interests and power over the needs of the public.

### Propaganda Versus Government Propaganda

One of the difficulties in determining whether something constitutes government propaganda, or propaganda more generally, is in knowing whether and to what degree false or distorted messages are intentionally crafted to produce a particular outcome. The clearest case for calling something government propaganda is when the

government can be shown to have consciously and strategically lied to cynically manipulate the perceptions or behavior of the public in a specific desired direction and often against the public's own best interest. However, it is often difficult to determine whether the distortions are outright lies or are actually to some degree self-serving beliefs or manifestations of denial on the part of those creating the propaganda. Research on groupthink indicates that powerful in-groups (who are often the ones crafting the propaganda) often believe part or all of their own messaging. There is also the phenomenon called "saying is believing," that is, articulating a position to others, even if it runs counter to one's own beliefs, can persuade oneself of the rightness of the belief.

The difficulty for psychologists to empirically determine whether a message was an utter lie versus a distortion versus a rationalization has likely led them to focus their attentions on phenomena related to propaganda that are more easily operationalized and quantified. The effect of the messaging on the recipients of the information in the form of influence and persuasion has been of particular research interest. To understand the scope of the process of propaganda, it is important to understand sender, gatekeeper, and recipient and the synergy among these components.

### The Sender

One level of deception can occur around the transparency of the source of the message. For propaganda to be successful, the credibility of the source must be vouchsafed. White propaganda involves a transparent source. Gray propaganda means the source is ambiguous, while in black propaganda the source is falsely attributed to another. White propaganda still has intent behind it, but the source is known and can be amplified or made more credible by the gatekeeping media. In gray propaganda, the credibility of the source cannot be accurately evaluated, so the message would seem to stand alone and often entails rhetorical devices (for example, straw man argument, diversion, *ad hominem* attacks) to make the message salient. The gatekeeper can bolster the credibility of gray propaganda by serving as a proxy for the source.

Black propaganda involves the greatest deception; the message is false because the attributed

Colonel Muammar Gaddafi, ruler of Libya for 42 years, reveled in a cult of personality that was supported by various forms of government propaganda promoting his agenda, including postage stamps (left) and the Green Book (right), as well as pop music, staged public events, and items such as watches and school satchels. Gaddafi propagated the lie that the public adored him, when in fact he was a cruel and hated dictator; his network of deception finally collapsed during his overthrow and eventual assassination on October 20, 2011.

source is false. Black propaganda appears to come from the out-group and comports with the intent of the propagandist. The message itself discredits the out-group (for example, reveals their malevolent intent), and the receiver of the message believes that his or her reaction is to the message of the out-group and not to the result of manipulation by the propagandist. Gatekeepers can again play a role in amplifying this deception if they fail to reveal the true source.

Another aspect of deception at the sender level is the nature of the message. Much of George Lakoff's recent work has focused on the use of false or misleading metaphors and frames in politics to mislead and influence others. Frank Lutz has made an art of identifying words or phrases, not those that most accurately capture a political position, but those that are most convincing to the public in the direction desired by politicians (for example, using the term *death tax* instead of *estate tax*). Senders might also use scapegoating, priming, stereotyping, rationalization, the rally effect and other potent symbolism, distinctions

between the in-group and the out-group, agenda control, half or selective truths, or classical conditioning (to name just a few) to convey deceptive or false information

### The Gatekeepers

As mediated communication, the gatekeepers play a critical role in amplifying or mitigating the efficacy of propaganda. W. Lance Bennett describes gatekeeper biases (the biasing tendencies of the individuals and groups who present the news) that result in varying degrees of deception. According to Bennett, there are four biases in news media: dramatization, personalization, fragmentation, and normalization.

Dramatization is the act of turning events into stories; natural disasters aren't communicated as meteorological or geological events resulting in loss of life and infrastructure, but rather human victims suffering, human agents causing or coming to the aid of the suffering, acting heroically or not acting heroically, and with an imminent resolution to the tragedy. In addition to the information

that is omitted by dramatized news stories, audiences' understanding of the topics is further hindered by the effects accompanying imagery can have on their cognitive processing of the information being presented. Michael Milburn and Anne McGrail found that when people view news stories with dramatic images, their ability to see the story from multiple perspectives, as well as to merge those perspectives into their own understanding of the event (a dimension called cognitive complexity), decreases.

Personalization is the process through which events are reduced from the products of interconnecting systems, like institutions and political parties, to stories about individual competition and cooperation. This process estranges the events from their context, so that audiences perceive them to have occurred spontaneously, making it difficult to understand and subsequently question the institutions which enabled them to occur.

Fragmentation takes this process further by packaging news stories into incoherent narratives of events with no recognizable relation to one another or historical context. News segments that move between interviews with reporters on the scene, experts in the studio, and descriptions of the event itself are fragmented; the linear, causal sequence of events is buried beneath subplots and opinions. They are difficult to draw conclusions from, and so the big picture is elusive.

The last of Bennett's content biases, normalization, refers to the means by which exceptional news stories are presented as normal and inevitable events that will soon be resolved. Wars are tragic but necessary; soon this one will be over, soldiers will return to their families, and things will be back to normal. Normalization presents avoidable, extreme events as unavoidable and routine, and as a consequence people begin to accept unacceptable atrocities as common occurrences.

Edward S. Herman and Chomsky's propaganda model has suggested that government propaganda and corporate propaganda have merged in the modern era. The commercial media serve as the gatekeeper for political messages that correspond to the desires or needs of the sponsoring corporations, and industry provides financial and political support for politicians who articulate industry-serving messages; there is a feedback

loop between politicians and corporations shaping political propaganda that remains largely invisible to the receivers unless exposed by the gatekeeper media. In a more general sense, Herman and Chomsky's model asserts that the news industry's product is not news, but audiences. As news companies' primary source of revenue comes from advertisements, they are actually selling people to consume those ads and the products and services they describe to advertisers. As a result, the news industry's services are oriented toward the businesses that buy ad space, not the readers who purchase their papers or watch their television programs.

This relationship between the media and its patrons creates a paradigm in which the primary function of the news is not to inform but to sell, and this selling behavior is regulated by what Herman and Chomsky refer to as "filters." Filters are social mechanisms that function to determine which stories are told and how, which in turn determines which topics the public thinks about and the context in which they consider them. In *Manufacturing Consent*, the authors describe five types of filters.

The first filter they describe is the ownership filter. Because media outlets operate for profit, their stories are subject to the scrutiny of the wealthy members of the boards that direct them. Capitalist values indicate that those boards will insist on portrayals of events that are conducive to their agenda, which is the generation of profit from ad revenue. Stories that undermine the profitability of a media outlet's advertisers often result in retracted statements and public policies when they are run, but in most cases they are not run at all, and this is the result of the second filter: the advertising filter. All businesses must cater to their customers to ensure profitability, and perhaps one of the greatest works of propaganda in the United States is the perpetuation of the myth that the mass media's customer base is the public.

The third filter identified by Herman and Chomsky is the source filter. The media depends on a steady flow of current events to lead the public to their advertisers, and the most efficient way to maintain that flow is by establishing reliable sources from whom to acquire the stories which perpetuate it. This process inevitably leads to sources who can provide the most dramatic news

in the greatest volume, becoming the primary sources for news stories and giving them concentrated and near-exclusive control over the information from which public opinion is formed.

News outlets that do not accommodate these three filters are subjected to the fourth filter, flak. The flak filter is composed of intentional, concerted punitive actions conducted against media organizations that contradict their ownership's ideology, create unfavorable market conditions for their advertisers, or challenge the credibility of their primary sources' information. Owners can terminate jobs, advertisers can pull ads, and primary sources can decline to furnish information to organizations that deviate from the status quo.

The final filter in the propaganda model is the anticommunism filter, although Chomsky has stated that, retrospectively, they would have included antiterrorism and other labeling mechanisms, the primary result of which is enemy generation. This filter capitalizes on the political myths that there are evil individuals in the world engaging in evil behaviors that threaten public safety. This allows the news industry to frighten the populace by presenting dangerous enemies, and by using generic labels to describe those enemies they can associate domestic individuals with similar characteristics (as when environmental activists become "terrorists"). Thus, the gatekeepers play a supportive or corrective role in the transmission of propaganda, but as both Chomsky and Bennett suggest the corporate media is increasingly making its own independent contribution through deception and obfuscation to propaganda.

### The Recipients

For propaganda to be believed, there needs to be a receptive audience. If a country's population is not willing to believe government statements, then any attempt at propaganda will immediately or ultimately fail. An important example of a government successfully using propaganda is the Nazi government in Germany, particularly in creating a cult of personality around Adolf Hitler, indoctrinating young Germans prior to World War II, resulting in fanatical young soldiers maintaining the fight near the end of the war, and in creating fear of the Allies' retribution and the destruction of Germany if they lost the war. An important

question is what factors contribute to the development of citizens who are willing to believe government propaganda.

As part of her review of Germanic child-rearing practices over a 200-year period and their relationship to the Holocaust, Alice Miller argued that child-rearing characterized by what she termed the "poisonous pedagogy" helped create a German population that was susceptible to propaganda. The child-rearing practices she identified include, for example, frequent use of physical punishment, punishing obstinacy with the goal of breaking the child's will, and denial of the child's emotions. This kind of child-rearing will develop a population that is receptive to being manipulated by propaganda since, Miller argues, these people are used to being manipulated by authority figures.

There is considerable evidence that childhood experiences characterized by frequent physical punishment and emotional abuse increase support for authoritarian beliefs and for punitive, conservative public policies like the death penalty and the use of military force, both policies with a large symbolic component of power, toughness, and retribution. This appears to be a result of the process of emotional displacement, in which emotions developed in response to one situation are internalized, carried, and displaced onto a different target in a different situation. There are numerous experimental studies showing that this process operates in the short term, as well as evidence indicating that this process is responsible for the relationship of childhood punishment and conservative political attitudes.

Related research has found that authoritarians are more vulnerable to persuasion by authority figures and will even change their initial opinion in the direction of the advocating authority. A clear implication of this is that authoritarians and conservatives should be more susceptible to the influence of government propaganda, especially when the government disseminating the information is seen as authoritative, for example, conservative. This was the case during the Iraq War that began in 2003, during which the Bush-Cheney administration presented as justification for the war that Iraq possessed weapons of mass destruction and that Saddam Hussein had links to Al Qaeda. Despite both claims being without

foundation, a significant number of George W. Bush's supporters have continued to believe both these assertions.

For propaganda to be successful in its transmission and influence, the collusion of deception at all levels is required. The sender must engage in misleading or false messaging, and the source of this message may be enhanced or obscured. The gatekeepers must transmit the message in such a way that its credibility and believability is preserved or enhanced, and the recipients must be open to the misleading or false message.

## Great Gatsby, The

F. Scott Fitzgerald's *The Great Gatsby* has been widely hailed as the quintessential American novel, yet essence is precisely what proves elusive in Jay Gatsby and the supporting cast. Trusting their dreams more than their experiences, they trade the substance of reality for hollow representations of an ideal. According to literary critic Harold Bloom, Gatsby's "refusal to surrender to reality" destroys him, "yet it also gives him his peculiar greatness." An examination of self-deception in Jay Gatsby, Tom Buchanan, and Nick Carraway reveals distinct incongruities between belief and reality that shape the psychological core of the novel: hypocritical prejudice (Nick), base elitism (Tom), and grand delusions (Gatsby).

### Nick Carraway

Narrator Nick Carraway's language "is consistently seen to work against the demands of veracity," according to critic Barbara Will. While keenly attuned to duplicity in others, he is blind to his own shortcomings and biases. For

example, after starting a relationship with professional golfer Jordan Baker, Nick casually reveals a “vague understanding” with a girl back home that should be “tactfully broken off.” The reader connects this off-hand remark to his earlier—now suspicious—denial of an engagement. While lying to other characters and misleading the reader, the narrator takes pride in believing himself, “one of the few honest people [he has] ever known.”

Valuing sophistication over truth, Nick respects other liars who are convincing and ridicules those who are awkward. He admires the sister of Tom’s mistress for brazen lies displaying “a surprising amount of character” and appears similarly unconcerned when Jordan cheats at golf, musing that “dishonesty in a woman is a thing you never blame deeply.” In stark contrast, Nick scorns Jay Gatsby’s “threadbare” yarns, mocking his alleged ruby collection and Oxford education. The reader’s perception of the *Gatsby* characters is doubly clouded, first by their own falsity and second by the narrator’s distortions.

### Tom Buchanan

Nick’s college friend Tom Buchanan deceives himself in a more sinister way. A wealthy graduate of an elite university, he fancies himself a man of superior breeding, the defender of old-fashioned values. However, Tom’s racist, misogynistic rants display neither refinement nor morality, and beneath the shallow veneer of a gentleman, Tom is a brute who cheats on his wife, beats his mistress, and participates in a murder.

Tom’s “arrogant eyes” seek any opportunity for advantage, even when his wife, Daisy, accidentally runs over his mistress with her suitor Gatsby’s car. When Nick observes the married couple deep in conversation (“anybody would have said that they were conspiring together”), he infers that Tom precipitated Gatsby’s murder by manipulating the dead mistress’s armed and anguished husband. Like a petulant child whose toy has been broken, Tom views his actions as “entirely justified.”

### Jay Gatsby

The grandest delusions of all are reserved for Jay Gatsby, a “self-made man” in two senses. From humble beginnings (“Mr. Nobody from Nowhere”), he has amassed great wealth. He has

also reinvented his public persona, creating an identity so full of contradictions that even he cannot distinguish who he is from how he presents himself. Having changed his name from James Gatz to Jay Gatsby, he “sprang from his Platonic conception of himself.” As one Fitzgerald scholar has observed, “Jay Gatsby is the creation of James Gatz, a fictional identity or incognito which is at all times threatened by reality; yet in the end James Gatz comes to seem less real than Jay Gatsby.”

Gatsby appears as a magician cloaked in mystery, repeatedly “vanishing” from view, presiding over carnival-style “amusement park” fêtes, driving a “circus wagon,” and flashing cards and photographs linking him to prestige, money, and power. He is rumored to be a killer, an Oxford scholar, and a German spy. A party guest dubs him “a regular Belasco,” after the Broadway producer David Belasco, who used faux scenery praised for its realism. By drawing this comparison, Fitzgerald suggests the elaborate set of Gatsby’s mansion, and even his carefully cultivated life, are no more authentic than stagecraft.

In spurning truth as the descriptive reality of how things are, Gatsby devotes himself to the hopeless pursuit of truth as an ideal—how things could be. Before publishing the novel, Fitzgerald deleted a passage from Gatsby’s childhood, which he later wrote into the short story “Absolution.” The child protagonist in this story is described as one who, “like all those who habitually and instinctively lie,” has an “enormous respect and awe for the truth.”

As an adult, Gatsby has transformed his unbalanced esteem for the truth-as-ideal into an equally disproportionate obsession with Daisy. Daisy appears as a dream without substance, defined and redefined by the men who love her. If she leads Gatsby on, it is only by being too passive to shatter his delusion that she will leave Tom for him. His dash toward their unattainable future recalls, in its bittersweet purity, the pursuit of the American Dream.

The last step in Fitzgerald’s exploration of self-deception lies in the final reinvention of Gatsby as hero and comrade. Gatsby the fraud, the bootlegger and adulterer for whom Nick professed “an unaffected scorn,” has, in the narrator’s eyes, “turned out all right at the end.” Without any act of redemption, he becomes “worth the whole

damn bunch put together.” Nick illustrates this about-face dramatically when he erases an unspoken, obscene word scrawled on the steps of the late Gatsby’s mansion, embracing Gatsby’s fantasy. A sweeping nostalgia breathes this wishfulness into the reader, whom Nick invites to take Gatsby’s place, reaching for “the green light, the orgiastic future that year by year recedes before us. It eluded us then, but that’s no matter . . .” If Daisy is the elusive American Dream, Gatsby, according to Lionel Trilling, “comes inevitably to stand for America itself.”

White House visits varied depending on the sitting president’s political party. During Bill Clinton’s second term, Greenspan met with the Democratic president roughly 12 times per year; in George W. Bush’s first term, Greenspan met with the Republican president roughly 53 times per year. Greenspan’s discussions of and explanations about the health and direction of the economy were often confusing, and he was often accused of being deliberately ambiguous—an accusation that he did not try to refute.

As a young man, Greenspan set his sights on a career as a jazz musician, but his ability with mathematics and a fascination with the philosophy of Ayn Rand led him to graduate work in economics at New York University (NYU). He left NYU without submitting a dissertation in order to found Townsend-Greenspan, a consultancy firm he would preside over from 1954 to 1987. He chaired President Gerald Ford’s Council of Economic Advisers (CEA) from 1974 to 1977 and the National Commission on Social Security Reform from 1981 to 1983.

One of the key functions of the Federal Reserve chairman is to predict how the economy is going to perform. Greenspan, however, had never proven to be particularly adept at such forecasting. The following examples illustrate how Greenspan missed the target.

When the Federal Reserve ranked firms on their forecasting abilities, Townsend-Greenspan came in last.

In January 1973, four days before the Dow Jones began a two-year slide losing 46 percent of its value and throwing the country into a two-year recession, Greenspan confidently told the *New York Times* that investors could be particularly “bullish” in their approach to the stock market.

In 1985, two years before he was appointed to lead the Federal Reserve, Greenspan wrote a letter to federal regulators in support of Lincoln Savings and Loan. He argued that the savings and loan was being run in exemplary fashion by Charles Keating and that it was making sound investments. As such, it presented no risk to the Federal Savings and Loan Insurance Corporation (FSLIC). In reality, Lincoln was involved in massive fraud, was seized by regulators in 1989, and Keating was sent to prison.

## Greenspan, Alan

Alan Greenspan was chairman of the Federal Reserve Board from August 1987 until January 2006. A Republican and free market advocate, Greenspan was often accused of straying across the line of political neutrality that his predecessors had observed. Some referred to him as a “political hack” who put the interests of his party before those of the country. For example, Greenspan’s

During Greenspan's 1987 confirmation hearings as Federal Reserve Chairman, he was chided for the inaccuracy of his predictions while he was chairman of Ford's CEA. Senator William Proxmire pointed out that the predictions of the CEA were seriously flawed, the farthest off of any predictions made from 1976 to 1978.

### **Confronted With Errors, Responding With Evasion**

When confronted with his errors and failings, Greenspan's responses were evasive or unclear. For instance, when confronted with the inaccuracy of his predictions while chair of the CEA, Greenspan countered that he did not recall the predictions being that far off the mark. When presented the actual numbers, he shrugged them off, complaining that he was hampered from presenting an accurate picture because it was more difficult to forecast accurately from inside the government than it was from outside. Despite evidence of his inability to forecast accurately, Greenspan was confirmed as chairman of the Federal Reserve by a vote of 91 to 2.

Greenspan's style of speech has earned its own terminology: FedSpeak and Greenspeak. FedSpeak describes the language of the Federal Reserve in general, while Greenspeak describes Greenspan's speech in particular. Both terms represent language so dense and ambiguous that it often defied understanding. Students of Greenspeak contend that Greenspan was especially likely to use it when he was presented with questions he preferred not to answer. His response was filled with jargon and couched in tortured syntax that would last as long as five minutes. When the time was up, his questioner, totally befuddled, would simply move to the next question. Unchallenged, Greenspan continued to provide pseudo-answers to serious questions throughout his career. He was known to say that if listeners thought that they understood what he said, they were probably wrong. In *Maestro*, Bob Woodward quoted Greenspan as saying, "I'll just say a little bit this way and a little bit that way, and I'll completely confuse them so there'll be no story." He also contended that if, somehow, people understood what he said, that had not been his intention. According to Frank Partnoy, Greenspan occasionally worked at being purposefully misleading.

Greenspan spoke in public only when required, a strategy that helped deepen the mystery around him and strengthen his political power. He made every attempt to avoid journalists' questions and admitted to purposely confusing them in order to quash any stories. Greenspan, unlike previous Fed chairmen, was viewed as a political figure who often used his position to further Republican causes. Those like William Greider and Partnoy, who blame the problems of the current U.S. economy on him, argue that the economy was not his first priority, conservative ideology was. If so, then Greenspan may have purposely blurred his meaning about the economy in order to cover his true agenda.

Americans have become so inured to what government officials tell them that news that one of them might actually have lied hardly comes as a surprise. Few Americans pay close attention to national and international affairs. Subjects as complex as banking and the economy are perceived to be so beyond their ken that they expect the pronouncements of the Federal Reserve chairman to be unfathomable. It's easier to have faith that he knows what he's talking about.

However, when \$7 trillion disappears, and the economy is in a shambles, someone has to be held responsible. In 2007 and 2008, after publication of his autobiography, *The Age of Turbulence*, Greenspan went first on a nationwide and then on a worldwide tour promoting it. On the tour, he appeared to absolve himself of responsibility for the faltering world economy, something that was contested by economists throughout the world. In October 2008, testifying before Congress, Greenspan all but confessed that his view that the invisible hand of the marketplace would eventually lead markets to regulate themselves was simply incorrect, and it had led to the near collapse of the world financial system. While he is probably right, much of what he did and said while Fed chairman certainly contributed to the later economic malaise.

## Guilt

The emotion of guilt is a negative feeling that people can experience for a wrongdoing, such as being untruthful or deceptive to others. This differs from the legal meaning of guilt, which refers to a person's culpability for an offense that violates a particular law. It is also useful to distinguish guilt, which stems from a negative evaluation of a wrongful behavior, from shame, a related emotion that arises from a negative evaluation of the self. The capacity to experience guilt differs from person to person, with some individuals feeling guilty more often than others for a variety of interpersonal and private misdeeds. Individuals can feel guilty for offenses in the past, present, or that are anticipated in the future, as well as for violations committed by close others or by one's group. Overall, years of research evidence suggests that moderate feelings of guilt are adaptive and important for social functioning.

Feelings of guilt can occur following a focus on a specific action or nonaction that goes against

personal or societal standards. Lying, cheating, and stealing are some of the most common examples of acts that can elicit feelings of guilt. Guilt is considered to be a self-conscious and moral emotion because it involves an evaluation of the self, and it plays a crucial role in guiding moral behavior. Beyond feeling bad, guilt is also characterized by feelings of regret and tension. Moreover, guilt is sometimes described metaphorically as a heavy burden or weight on one's conscience.

### Guilt and Shame

Guilt is often confused with shame. People may refer to these emotions incorrectly or interchangeably; however, much evidence suggests that they are distinct. Similar to guilt, shame is an unpleasant feeling, but shame tends to be a more painful experience and is characterized by feeling

*Guilt is often confused with shame, which is associated with withdrawal behaviors such as avoiding others. Guilt is more often linked with repair behaviors, such as taking responsibility, apologizing, or putting in additional effort with others.*

worthless, exposed, and small. There are not reliable distinctions between the types of situations that can separately evoke guilt or shame, and it is possible to feel a certain level of both emotions after a misdeed or failure. For example, compared to shame, guilt more often arises from private rather than public wrongdoings; however, individuals can feel guilty for public misdeeds and feel shameful for private acts.

Instead of a particular context, guilt and shame can be distinguished by the negative evaluations that individuals make after lying or following some other harmful action. Negatively judging the self by focusing on what “I” did wrong can elicit shame, whereas negatively judging the wrongful behavior by focusing on what I “did” wrong can evoke guilt. Thus, it is perhaps easier to understand why guilt may feel less painful than shame, because guilt stems from a greater focus on a temporary act as “terrible” rather than a global evaluation of the self as a “terrible person.” Guilt and shame may also be distinguished by the type of behaviors following a wrongdoing. Shame tends to be associated with withdrawal behaviors such as avoiding others. Guilt is more often linked with repair behaviors, such as taking responsibility, apologizing, or putting in additional effort with others.

### **Guilt Proneness**

People vary markedly in their propensity to feel guilty. Across a number of situations involving perceived wrongdoing, some individuals will reliably experience guilt more often than others. That is, guilt proneness is a personality trait that occurs on a continuum, with individuals being more or less guilt-prone. This means that some people will feel intense guilt after being deceptive whereas others will feel little to no guilt following the same act. Guilt proneness is believed to decrease people’s frequency of engaging in unethical behaviors because guilt-prone individuals anticipate unpleasant guilty feelings for committing acts that they perceive to be wrong.

Although many measures of guilt proneness have been created, it has been more recently assessed by asking individuals to imagine brief scenarios of wrongdoing and indicate how likely they would respond in ways that are theoretically aligned with feelings of guilt. Those higher

in guilt proneness tend to self-report engaging in less unethical behavior than those lower in guilt proneness. There is also evidence from laboratory settings that guilt proneness predicts likelihood of lying or behaving dishonestly. For example, following a monetary incentive to lie to another person, 45 percent of those low on guilt proneness lied, compared to 20 percent of those high on guilt proneness. In workplace settings, more guilt-prone individuals are less likely to be counterproductive, or commit acts that harm others in their office or their organization. Higher scores of guilt proneness are also related to lower frequencies of delinquent behaviors, such as entering a venue without paying or calling in sick when healthy.

Such evidence from everyday life supports the view that guilt is adaptive because of its role in regulating moral behavior. Even among those in jail, a proclivity to feel guilty is related to committing less severe crimes and having fewer criminal convictions. An important distinction between clinically diagnosed psychopaths and those in the normal population is the ability to experience moral emotions, such as guilt. Consistent with this notion, infrequent feelings of guilt are associated with higher levels of psychopathy and antisocial personality, psychological conditions that are more common in prison populations.

The capacity to feel guilty for violations of personal or societal standards has links to other important psychological factors. In particular, individuals who feel guilty, whether it is for a specific event or a tendency in general, are also more likely to experience empathy. That is, stronger feelings of guilt are also related to a greater ability to take on other people’s perspectives, feel more compassion for others, and have a greater concern for one’s effect on others. This association is noteworthy because empathy is fundamental in promoting positive interpersonal relationships and prosocial behaviors and inhibiting aggression toward others. In addition to empathy, those who are guilt prone are also more likely to be agreeable and conscientious individuals.

A tendency to experience guilt is unrelated to levels of self-esteem, neuroticism, anxiety, rumination, and related psychological conditions. In other words, a propensity to feel guilty does not predict the occurrence of many common

psychological disorders; instead, the ability to feel a moderate amount of guilt appears to have healthy interpersonal consequences. In general, it may be beneficial to know individuals' degrees of guilt proneness, as it may be useful in predicting future patterns of unethical actions and interpersonal functioning. However, the results of research conducted on guilt proneness is better suited to describing groups of individuals across situations rather than a specific individual case, and current measures of guilt proneness may be susceptible to malingering. Thus, some caution is warranted when determining guilt proneness and applying the results of research.

### Collective Guilt

In addition to feeling guilty for personal wrongdoing, individuals can feel guilty for acts committed by close others or their group. Only limited research has examined vicarious guilt for the actions of those interpersonally close to an individual; however, there is relatively more known about collective guilt for harm committed by one's group. While the unpleasant experience of collective guilt can feel similar to personal guilt, collective guilt is distinct from guilt related to personal responsibility for wrongdoing. Individuals may feel collective guilt when they identify with members of a group that has committed harmful actions in the past, or plans to do harm in the future. Some examples of harmful group acts include lying, stealing, or perpetrating violence against another group.

Group members are often motivated to protect positive views of their group, and thus they may engage in a variety of protective psychological processes that prevent or assuage collective guilt. Such factors may partly explain why collective guilt is experienced less frequently than individual guilt. For instance, group members may be prone to minimize or "forget" harmful actions committed by their group. When the action cannot be denied, group members may be less likely to accept full responsibility for the harm or they may legitimize their group's wrongdoing. If, however, conditions lead to the acceptance of illegitimate harmful group actions and feelings of collective guilt, then this experience, in conjunction with other psychological factors, may play a role in support for reparations or fostering intergroup relations.

### Conclusion

Although feeling guilty is an unpleasant experience, it is an adaptive emotion that has a role in preventing destructive behavior and repairing harm committed, outcomes which have important implications for personal and societal functioning.

## Gullibility

The term *gullibility* has numerous meanings, including foolishness, naiveté, unwarranted trust, belief despite little evidence or when there is evidence one should not believe, credulity, and susceptibility to manipulation and exploitation. Characteristics of gullibility include an enduring pattern of personality or a cognitive trait, and other times it is a product of temporary situational, emotional, or cognitive influences. Colloquially,

some refer to those duped on a single occasion as gullible persons. However, it is worth considering someone repeatedly taken advantage of by others to be gullible. Because of the important impact that gullibility can have on a person's decision making, research on gullibility spans a wide variety of topics and domains, including financial, legal, political, scientific, religious, interpersonal, and the workplace.

Historically, scholars and practitioners have been interested in gullibility as it relates to being taken advantage of, such as by snake-oil salesman or new religious movements. More recently, this topic is discussed within the context of high-profile financial scandals (for example, Ponzi schemes), false confessions in criminal cases, and an ever-increasing amount of online social interactions. This has important implications because research on gullibility has focused heavily on face-to-face interaction. As society moves toward increasingly frequent online interactions, it is less clear whether the causes of gullibility are specific to in-person interactions. It is likely that many cues that signal untrustworthiness are more difficult to recognize in online social situations.

Research suggests that gullibility relates to a high degree of trustworthiness in another person, group, or an institution. Research on interpersonal trust (a general expectation that people will be true to their word), conducted by Julian Rotter and colleagues, suggests such a relation between trust and gullibility is unlikely to be the case. Individuals who score above average on an index of interpersonal trust tend to be no more susceptible to being fooled or manipulated than those who score average trustworthiness. Evidence suggests that those who rate themselves as very trusting may in fact be less gullible, on average. One reason for this may be that the so-called high-trusters develop abilities to accurately identify untrustworthiness in others. In other words, high-trusters assume that other individuals are trustworthy; however, they are unlikely to be exploited because of their ability to detect untrustworthiness.

Copious research suggests that individuals frequently behave automatically, without conscious thought, relying on mental shortcuts (heuristics) to ease decision making. Rather than deciding if

someone is trustworthy, many individuals instead rely on intuitive cues about someone's trustworthiness. For instance, a person will believe someone who is known to have expertise, such as a medical doctor. However, it is relatively easy to manipulate trustworthiness cues, such as by wearing a uniform (for example, a lab coat), merely stating credentials (for example, M.D. or Ph.D.), or even speaking quickly; each signal trustworthiness that may in fact be unwarranted. For example, jurors sometimes find eyewitness testimony suspicious when a witness hesitates while recalling information verbally. While such cues have advantages in everyday judgments, they can expose a person to exploitation.

Numerous ordinary characteristics can increase gullibility, such as tiredness, distraction, emotional arousal, and uncertainty. For example, someone who is multitasking is less able to recognize crucial signals that someone else is acting untrustworthy; hence, gullibility increases. Similarly, stress and time pressure, novel and ambiguous situations, or lacking knowledge or expertise sometimes lead to gullibility. In unfamiliar situations, individuals rely on others for cues regarding appropriate behavior and open themselves to exploitation by others.

Research on the Barnum effect (the tendency to find personal meaning in statements that could apply to many people) suggests that individuals accept false personality feedback, even when the information is trivial or descriptive of many people. Similar to gullibility, the Barnum effect occurs because of a person's lack of statistical knowledge about standardized personality assessments and base rate information, among other things. An established empirical pattern suggests that gullibility is unrelated to intelligence. Even very intelligent individuals will sometimes be gullible. Individuals who do not rely on mental shortcuts are less prone to gullibility. In sum, although there are a variety of enduring characteristics that contribute to gullibility (e.g., emotional or cognitive styles, agreeableness), it is likely that many characteristics of gullibility are at least partially determined by situational characteristics.

Recent neuroscience research suggests that specific areas of the prefrontal cortex mediate gullibility and credulity. Individuals with brain

damage in such areas evidence a reduced ability to determine truth from lies in advertising and make unwise purchasing decisions. Such evidence is important because it supports findings related to changes in gullibility across the lifespan. Young individuals and the elderly tend to be the most gullible. Among the young, gullibility could stem from a lack of experience or knowledge. However, this research suggests that developmental changes in the prefrontal cortex over the lifespan may substantially influence occurrences of gullibility. In young individuals the prefrontal cortex is not fully developed, whereas for elderly individuals the prefrontal cortical cells may be in decline because of aging.

### Benefits to Gullibility

Although the term *gullibility* carries a negative connotation and suggests negative personal characteristics and actions, there are possible benefits to gullibility. For instance, interpersonal relationships sometimes benefit when at least one person behaves at least somewhat gullibly. Doing so may allow for trust to build between potential friends and romantic partners. Further, evolutionary psychology research suggests that, at least sometimes, in order for knowledge to transfer between individuals, individuals need to trust each other enough to accept what other people tell them as truthful. Gullibility may be an adaptive antecedent to interpersonal trust.

Evidence suggests that gullibility is multifaceted and it has many predictors and contextual influences. While comforting to view gullibility as a trait (that other people have), it is likely that gullible behaviors are the product of complex personal and situational interactions. Considering individual differences, the causes of gullibility likely vary. In other words, for some individuals the causes may be related to personality characteristics or cognitive style. For others, the causes may be entirely situational. For others still,

gullibility may be a combination of both personality and situational variables.

## Half-Truths

The term *half-truth*, when used intentionally, refers to a communicative strategy used to manipulate the amount of truth in a statement in such a way that it causes the hearer to draw incorrect or incomplete conclusions and make false assumptions. Truth, here, does not mean the objective truth. It means some state of affairs that, correctly or not, the speaker believes to be true.

As the name indicates, half-truth is partial truth. The speaker reveals only part of the truth, while concealing another part that is important for the hearer to know, and the speaker is aware of this concealment. Consider an example in which a schoolgirl puts off doing her homework, even though she does not have much time, and goes out to play with her friends. It is chilly and damp outside, and when she gets back home she begins to feel feverish. The next day, her teacher asks her why her homework was not finished. The girl says, “I got sick yesterday, that’s why.” What she says is true, but it is not the whole truth. She discloses only part of what she considers to be a complete disclosure, while keeping the other relevant part concealed.

In cooperative communication, there is an assumption that speakers will frame their utterances such that they are complete, that is, they do not leave out any important information, they

are truthful, relevant to the context, and clear or unambiguous. Strategic use of half-truths exploits one of these hearer assumptions about the nature of a speaker’s utterance, as half-truths are not “complete” and exclude some potentially risky piece of information. It is the deliberate concealment of such important and relevant information, and not some trivia, to cause the hearer to make false assumptions that makes it a half-truth.

Half-truths are deceptive because in a conversation between two people, there is an implicit trust that if one knows something that they are aware the other would like to know, they would tell the other person. If they don’t, especially if the conversation is about the same context, it would be a violation of trust.

### Half-Truths That Modulate Whole Truths

Although the example of the schoolgirl is the most common interpretation of the term *half-truth*, another sense in which it is sometimes used is to modulate the magnitude of the whole truth and alter its emphasis. An example of this second category of half-truth is a situation in which a child has a stomachache, and his mother asks him to take some medicine. The child wants the mother to infer that he does not need any medicine and says, “My stomach already feels much better,” when his stomach is only slightly better. Here, the child is not leaving out any distinct piece of

information but is minimizing the emphasis or evaluation of the truth. This case is structurally different from the classic half-truth, but at times it is regarded as a half-truth because it is also generated by the violation of the hearer's expectation that what the speaker utters would be the complete truth.

A classic half-truth can be used both to conceal information and to propagate a falsehood. The half-truth in the schoolgirl example not only conceals the fact that the girl decided to go out and play with her friends instead of finishing her homework, but it can also cause the teacher to make a false inference that she is a responsible girl and it wasn't her fault that her homework was not done. A half-truth of the second category is generally used for propagation of falsehood, and not for concealment, because if the hearer has no belief pertaining to the information the speaker wants to conceal, it makes no sense for the speaker to understate that information because that might enable the hearer to infer that information, when in fact the hearer needs to be kept away from it.

### Maintenance and Detection

Half-truths do not involve uttering any falsehoods that require future maintenance and do not use any kind of ambiguous language that might require further clarification. Therefore, they usually do not have the same stress and guilt that arise while engaging in direct deception in high-stakes social situations and can be more readily associated with some other forms of deception, like fabrication or equivocation.

Half-truths are relatively more difficult to detect compared to many other forms of deception. This is so because while telling a half-truth, the speaker is only concealing something and not fabricating a story, as in the case of outright lies. So there is less cognitive load for "maintaining" this story because there are no new things that the speaker has to remember and less chance that the story might be contradicted. Moreover, there is no obvious surface level feature of a half-truth that might indicate that there is something fishy, as could be the case for equivocations, which are ambiguous statements and could make the hearer suspicious. However, when detected, half-truths are generally rated as unacceptable and result in a loss of a speaker's credibility. Half-truths may

have a high cost, depending upon the context in which they have been generated, and the relationship between the speaker and the hearer.

An important characteristic of half-truths is that they can be generated not only using words but also using numbers. Aspects of statistical data can be presented as half-truths in a manner that serves the interests of the presenter. For example, omitting the values from a y-axis in a bar graph when they are very small, and instead bloating the bars to highlight the relative difference between variables, might not mean much in absolute terms because of the small y-values. However, consider another example of statistical comparison in which the basis of comparison is not clearly stated. Suppose the value of an item increased from 10 percent to 15 percent. As a percentage change, it increased by 50 percent, but as a share of the total value it increased by 5 percent. So there is ambiguity here about whether it is a 50-percent or 5-percent increase. The usual assumption would be that it is a percentage change, unless the basis of comparison is explicitly stated as the total value of the item.

## Hartzell, Oscar

Oscar Hartzell was one of the greatest con men of the early 20th century. He used a scam that had been around for hundreds of years, recruiting people to invest in a fraudulent lawsuit with the supposed goal of wresting the estate of the long-dead Sir Francis Drake from the British government. Hartzell used the Drake inheritance scam to swindle over a \$1 million from more than 10,000 investors.

Hartzell's scam had its roots in the Elizabethan Era soon after the death of Sir Francis Drake, the famous late 15th- to early 16th-century British buccaneer. Drake died on January 28, 1596, of dysentery off the coast of Puerto Rico, and it was assumed that he had amassed an enormous fortune in gold and other booty. Drake died without having fathered any children, and for hundreds of years his death has inspired scams that claim to search for supposed heirs to his purported fortune. However, no claimants were ever able to establish a direct lineage to Drake.

This swindle first appeared in the United States around 1835. In 1870, a Sir Frances Drake Association was established to settle the estate. Prospective investors were told that Drake left a large fortune, which by Hartzell's time had purportedly been held by the British government for over 300 years, collecting an enormous amount of interest. The

intended victims were told that, for a small contribution to cover the legal fees to settle the estate, they would get shares in the eventual proceeds.

### Hartzell and the Drake Scam

Oscar Merrill Hartzell was born in 1876, the son of a farmer from Madison County, Iowa. He grew up in the American Midwest during the late 19th century. He tried his hand at farming and worked for a while as a deputy sheriff.

In 1919, two con artists using the Drake scam, Milo F. Lewis and Sudie Whiteaker, made a pitch in Hartzell's family farmhouse in Madison County. Hartzell's mother decided to invest her life savings of \$6,000 in cash, which the duo promised would reap a return of \$6 million. Her two sons, Oscar and Canfield Hartzell, had overheard the pitch.

Oscar tracked Lewis and Whiteaker to Des Moines, Iowa, and confronted them. They admitted to bilking about \$65,000 from investors in Iowa during the previous two months. However, Hartzell convinced the pair that they were underestimating the full potential of the swindle, and they agreed to let him assist them in their schemes. Soon thereafter the three established a partnership, opening up an office for the Sir Frances Drake Association. They initially concentrated their recruitment efforts on Iowa, Illinois, and Missouri, contacting people with the last name of Drake. Eventually the Sir Frances Drake Association widened its sphere of operations and accepted investments from almost anyone.

Investors were promised that for every dollar invested in the plan, they would get back a return of \$500. However, Hartzell was aware of the laws pertaining to mail fraud, and initially he rigorously avoided using the mail. Nevertheless, the swindle took on momentum as it expanded and more accomplices were recruited.

Hartzell moved to England in 1934 and maintained an extravagant lifestyle paid for by the funds collected from his investors. He eventually claimed that he held the sole title to the Drake estate, as he had allegedly become engaged to the niece of Colonel Drexel Drake, who, wishing to keep the estate in the family, assigned all rights to Hartzell. Hartzell claimed he held the title Baron of Buckland, which he asserted had been confirmed as his by the King and Crown Commission when Colonel

Drake had assigned him the sole rights as heir. He described this actually nonexistent commission as the highest court in the United Kingdom.

Hartzell also said that King George V of England was engaged in transferring all rights and titles of the Drake estate to Hartzell until the king had become ill. Hartzell further claimed the British Parliament was in the process of conveying the tremendous assets of the fabled Drake estate to him, but before this could be completed and funds distributed to investors, complicated audits and complex accounting procedures had to be conducted, which, not surprisingly, would necessitate additional money up front.

### Prosecution and Conviction

A U.S. Postal Services inspector, John Sparks, collected enough evidence to finally have Hartzell deported from Great Britain as an undesirable alien in January 1933. As soon as he stepped foot on American soil, Hartzell was arrested. His trial began on October 23, 1933, in Sioux City, Iowa. The prosecutor in this trial, Harry Reed, later wrote of the unusually large and evangelistic support Hartzell received from his loyal followers. The Federal Bureau of Investigation (FBI) investigated and reported that Hartzell's scheme was all a hoax, as Drake's wife and brother had inherited the estate in 1597.

However, as soon as Hartzell was found guilty and released on bail, pending an appeal, he resumed his fraudulent investment plan. After the appeal was rejected, his conviction was upheld, and Hartzell was sentenced to 10 years in prison, which he began serving at Leavenworth Prison in November 1933. Hartzell's accomplices continued to solicit funds for his defense and release, and for this activity the accomplices and Hartzell were brought to trial in Chicago. By then it was obvious that Hartzell had become insane, believing his own long-told stories and insisting he was a billionaire. After a psychiatric examination was ordered in December 1936, he was found to be incompetent. He was accordingly transferred to the U.S. Medical Center in Springfield, Missouri, where he died on August 27, 1943.

### Why the Scam Succeeded

Hartzell was a confidence operator who was very effective at communicating with people

and capable of acting his part convincingly. He engaged in a form of confidence game known as the long con (as opposed to the short con), which is also referred to as the big con because of the elaborateness of the operation that begins with a buildup, uses numerous operators, and has a solid conclusion usually resulting in a significant amount of money taken from the victims. The long con typically concludes with a cooling-off process in which the confidence operator consoles the victims and helps them make the best of the situation. Hartzell was masterful in his ability to gain the trust of his victims, while at the same time keeping his professional theft operation going.

Those who became investors in Hartzell's Drake scam were referred to as Drakers and later as Donators. This group formed a broad social movement as the thousands of investors, mostly Midwestern farmers and shopkeepers, planned what they would do with their impending fortunes. Some planned to establish utopian communities, and this cause nearly became a holy crusade, with zealous believers protesting against the naysayers and doubters of Hartzell's mission.

The social feedback loops were very powerful among this collective group of investors, which included entire church congregations. In this regard, there was a story of a pastor who dared to question the authenticity of Hartzell and the Drake inheritance plan and who, as a consequence, was dismissed from his position. Once invested, of course, the Drakers would have to either accept the truth of their gullibility or else become fervent supporters of Hartzell, which many did do.

## Hearst, William Randolph

At the end of the 1800s, when other forms of media were minimal, newspapers were a vital source of information. As a result, newspapers possessed an inordinate amount of power over public knowledge and opinion. William Randolph Hearst was a newspaper publisher who used his power to advance his own agenda. In attempts to win a fierce competition for readers with Joseph Pulitzer's newspaper, Hearst relied on two common deceptive tactics: sensationalism and fabrication. In fact, his acts of deception led some to coin the term and associate him with "yellow journalism." Yellow journalists deceive their readers by sensationalizing and fabricating news to increase circulation numbers. Hearst's acts of yellow journalism during the Spanish-American War in 1898 are among the most notoriously deceptive tactics in the history of journalism and are credited for pushing the United States into war with Spain.

### Sensationalism

*Sensationalism* is a term used to describe the exaggeration and dramatization of news stories to capture the attention of the reader, appeal to their emotions, and deceive them. Hearst sensationalized news from the beginning of his career. As the owner of the *San Francisco Examiner*, Hearst devoted over a third of his newspaper to stories of crime and corruption and framed them as dramatic moral dilemmas. He sensationalized provocative and everyday events beyond ethical journalistic standards. For instance, just two months after Hearst took over management of the *Examiner*, a fire occurred at a hotel. On the front page, Hearst printed the bold, two-inch-high headline, "Hungry, Frantic Flames. They Leap Madly Upon the Splendid Pleasure Palace by the Bay of Monterey." By sensationalizing stories

through emotional appeals, Hearst deceived his readers, increased readership, and outperformed other San Franciscan newspapers.

Hearst amplified his sensationalistic style when he acquired the *New York Morning Journal* and began directly competing with Joseph Pulitzer's *New York World*. One major competition came when reporting on civil uprisings in Cuba. In 1896, the Spanish government sent General Valeriano Weyler to quash a civil rebellion in Cuba. Weyler overran the Cubans with an overwhelming number of Spanish troops. He detained Cuban people in concentration camps that were devoid of basic necessities, resulting in numerous deaths.

While this was an egregious act, Hearst overdramatized accounts of Cuban conditions. In one edition, the bold headlines of the *Morning Journal* read "Cuban Babes Prey to Famine," "Thousands of Children of the Reconcentrados Perishing in Island Towns," and "Sights That Sicken Strong Men." These headlines were accompanied by unrealistic drawings of small children suffering from severe malnutrition. Soon after, the *New York World* began covering the events in Cuba in response to the *Morning Journal*. The fierce competition between the two papers escalated the level of sensationalism.

### Fabrication

"Fabrication" refers to the creation of false information to deceive readers, and Hearst used fabrication, particularly in his visual reports. Frederick Remington was an artist for Hearst's *Morning Journal*. He went to Cuba to illustrate events. He recounted in a telegraph to Hearst, ". . . there is no trouble here. There will be no war." Hearst is accused of replying with, "Please remain. You furnish the pictures and I'll furnish the war."

Both the *Morning Journal* and the *New York World* reported on battles between the Cubans and the Spanish that never took place. Spaniards reportedly committed highly gruesome acts of violence against innocent Cuban women and children. Even without a code of journalistic standards at the time, these stories were so extreme that other major newspapers heavily criticized the *Morning Journal* and the *New York World*. Hearst and Pulitzer became the most flagrant abusers of these deceitful practices. Coincidentally, these two newspapers ran a satiric cartoon

Hearst also distorted stories to pursue his own political agenda. In his attempts to incite American outrage at the Spanish, a reporter for Hearst's newspaper misrepresented the events of an interaction between Spanish police and a Cuban woman. The reporter witnessed people take a Cuban woman named Clemencia Arango into custody as she boarded a New York-bound ship in Cuba. She was suspected of carrying letters from Cuban rebels. The *Morning Journal* printed a headline in bold, fist-sized font that read, "Does Our Flag Shield Women?" The front page printed an illustration depicting three Spanish men on an American vessel searching a naked woman.

Hearst also fabricated stories about the sinking of the U.S.S. *Maine* that some say finally pushed President William McKinley to declare war on Spain. On February 15, 1898, the U.S.S. *Maine* suffered a massive explosion and sank while patrolling the waters around Cuba. The *Morning Journal* reported that a Spanish mine produced the explosion. Hearst supported his claim

by printing a fabricated map of the minefield in Havana Harbor. The U.S. Navy's official investigation followed this report and concluded that the ship sank as the result of an external explosion. Further, the *Morning Journal* reported that the American soldiers who had died aboard the ship were not buried but were decaying in the harbor.

The cause of the explosion was unknown until a 1976 investigation provided evidence that the explosion occurred internally. Moreover, the Spanish actually buried the bodies shortly after the catastrophe. However, the resentment and anger about unburied bodies, the official yet erroneous conclusion that the ship sank by external explosion, and the public's anger finally pushed a hesitant McKinley to declare war on Spain in late April 1898. Some claim that Hearst effectively started the Spanish-American War.

### Conclusion

By utilizing deception in an age without other corroborative news sources, Hearst controlled public opinion. Hearst bolstered his empire, purchasing 28 papers across the country and expanding to books and magazines. However, this empire collapsed during the Great Depression, as his newspapers were not financially self-sufficient. They instead relied on income from other business ventures that floundered during the Depression. Although World War II helped Hearst's newspapers recover slightly, his days as a media magnate were over. Hearst died of a heart attack in 1951. However, his impact on journalism remains and informs modern-day journalistic ethics.

## High School Sports

For many children participation in high school athletics is an enjoyable and essential aspect of their adolescence. There are rigorous rules governing the participation of individuals within a sport as well as the academic benchmarks necessary for entry and continued access to the sport at the high-school level. These rules and benchmarks, most often developed through state and national agencies of high school athletics, are meant to ensure fair gamesmanship, equity of access and opportunity, and most important, that the educational component of participation in high school athletics is able to be delivered to children. Although instilling the value of fair play and sportsmanship is always a primary goal of those involved, this is not always achieved. Lying and deception, whether intentional or inadvertent, may interfere with the goals of building sportsmanship and respect for truth. Certain situations suggest that a desire for high school sports teams to be successful has encouraged lying and deception on the part of coaches, student athletes, and parents.

### Goals of High School Sports

This educational component includes, but is not limited to, consideration of skill development, moral development, and social development (for example, interpersonal and intrapersonal development). Each of these developmental domains is fluid and results from a child's experiences in the world. For young children, the development of skills and morality and development of a sense of self and of others takes place primarily in and through the home and secondarily at school. As the child matures, the home, while still essential for a well-adjusted child, is no longer the centerpiece of development. Rather, the

child's peer group(s), often discovered and developed through experiences in schooling, becomes central.

Another area central to participation in high school athletics is the development of sportsmanship. The following five pillars ground how sportsmanship is taught:

1. Show respect for the opponent at all times
2. Show respect for the officials
3. Know, understand, and appreciate the rules of the contest
4. Maintain self-control at all times
5. Recognize and appreciate skill in performance

These pillars also serve to delineate the responsibilities for athletes, coaches, spectators, and others. As long as these goals are the focus of high school sports, the risk of lying or deception seemingly is no greater than in any other endeavor. When an increased emphasis is placed on winning, however, the payoff for lying and deception grows.

### Outcomes of High-School Sports

High school athletics are one of many avenues through which a child can develop skills, a sense of morality, a sense of self and others, and sportsmanship. Sports such as football, volleyball, baseball, softball, and basketball provide obvious elements of team and character building within the structure of regular practice (both during the on and offseason) as well as the triumphs and pitfalls of competition. Sports such as cross country, track and field, bowling, and tennis also provide these elements even though their scoring structure is different from more popular high school sports.

There are numerous opportunities to cheat or engage in deceptive (illegal) activities while engaged in practices and formal competition. Some of these opportunities are on the part of the student athlete or coach. These opportunities for cheating arise for various reasons. In some instances, young athletes may misinterpret the directives of their coaches, peers, or parents. In other instances, much less common, children are told that they must cheat for some reason tied

to their place on the team. Both of these general instances are challenging for young athletes to interpret, considering their ongoing moral and cognitive development during adolescence. Often, but not always, the athlete is not able to see the long-term consequences of his or her actions on himself or herself, their team, or their school. Similarly, coaches who seek to maintain their jobs or obtain a better position through achieving a winning record may be tempted to lie or deceive if they believe this will improve their chances.

### Consequences of Lying and Deceptive Practices

Cheating in high-school athletics, while unfortunate is, sadly, understandable. Professional athletes often serve as role models for student athletes. Cheating in professional sports, while not pervasive, is a part of competition on that level. A student athlete is sent mixed messages by sports figures like Barry Bonds, Lance Armstrong, Marion Jones, and others. This, coupled with the models in the media of local cheating scandals in high schools and the challenges of maturation, can create confusing contexts for the young athlete. Moreover, the notion of cheating as a moral wrong is not clear for athletes or coaches. For instance, intentional fouls in basketball or holding in football, or more generally pushing physical contact within a game to see if officials will call a penalty or foul, demonstrate that children are taught and expected to "play hard" up to the point of being called for a penalty or foul.

The problem of lying and deception in high-school athletics is complex. While punitive measures will result if a high-school athletic team is found to have cheated during competition, often resulting in forfeiture of a match or removing wins from a team, deception also occurs on the part of parents and teachers in regard to rules of eligibility. Eligibility entails which students may participate in sports and may involve lying and deception regarding a child's grades, place of residence, or level of ability. An athletic team in the western United States, for example, was guilty of the latter. In this case, a student athlete hid a lacrosse ball in his hand and tossed it into the goal. This act was caught on videotape. Another case

occurred in the southeastern United States, where parents falsified documents and provided false addresses so their children could play on specific high-school teams. In another instance, a school in the Midwest was under state and federal investigation for student athlete eligibility issues. The result of such a case could mean that the school would lose its state championships and, because of the tampering of student grades, some students would not be allowed to graduate.

Research in the area of moral development and high-school athletics suggests that most young athletes admire and trust their coaches and feel they are learning important life skills. There are gender differences insofar as females are much more likely to express a deeper commitment to honesty and fair play while involved in competition. While student athletes admire their coaches, many are confused because they have often observed their coaches engaging in less than admirable behaviors that are seen as “part of the game” (for example, yelling at officials). Further, data suggest that those individuals involved in high-school athletics have cheated more outside of competition than those who do not participate in a sport during high school.

Because of the complexity of cheating in high-school athletics, state, national, and advocacy organizations take seriously their charge to educate coaches in developmentally appropriate approaches to assisting student athletes in the development of skills and sportsmanship. Organizations such as the American Sports Education Program (ASEP) offer coaches coursework, seminars, and opportunities for certification in the coaching of specific sports. State organizations throughout the United States have coursework opportunities for coaches to learn best practices considering the developmental readiness level of student athletes.

The seriousness with which high schools and their advocacy groups take the prevalence of cheating and the importance of supporting the development of the whole child has also led to the work of multiple consortiums that emphasize the importance of adolescents being involved in activities, be they sports or the fine arts, that teach teamwork, cooperation, and sportsmanship as well as the development of skills. Creating more transparent expectations of the goals of

high school sports may reduce the temptation for coaches, athletes, or parents to engage in lying and deception.

## Hispanic Americans

Hispanic or Latino Americans are a diverse group who have in common their ancestral origins in Spain or Portugal and especially their self-identification with the Hispanic or Latino label. “Latino” specifically indicates someone whose Spanish or Portuguese ancestry comes via Latin America, though in practice the terms *Hispanic* and *Latino* tend to be interchangeable. *Latin America*, a term coined in the 19th century by the Pan-Latinism movement, refers to the Spanish- and Portuguese-speaking countries of the Americas (that is, Ibero-America). In American usage it includes the Dutch-speaking Netherlands Antilles, Aruba, and Suriname; French-speaking Haiti, Guadeloupe, Martinique, and French Guiana; and English-speaking Belize, Jamaica, Barbados, Trinidad and Tobago, Guyana, Antigua

*Hispanic Americans and other supporters demonstrate at Lafayette Park in Washington, D.C., for immigration reform, May 2, 2010. Leaders were arrested for a sit-in at the railings in front of the White House in an act of civil disobedience. Implicit or explicit systems of reciprocity in the immigrant community—usually intended as a form of mutual assistance—is also a frequent barrier in criminal investigations and prosecutions, as individuals in the Hispanic community may be unwilling to “snitch” on community members.*

and Barbuda, St. Lucia, Dominica, Grenada, St. Vincent and the Grenadines, and the Bahamas. The American usage emphasizes the cultural and historical similarities in the region.

Hispanic American culture is influenced not only by a common cultural heritage but also by similar experiences in the United States, including the language and cultural fluency challenges faced by immigrants; the anti-Catholic, anti-Hispanic, and anti-immigrant sentiments encountered by Hispanic groups; and other factors. These common elements of the Hispanic experience have led to similar phenomena related to deception and lying throughout Hispanic American culture.

Hispanic Americans constitute about 16 percent of the American population, forming the second-largest ethnic group after non-Hispanic whites, and are growing at the fastest rate. Hispanicness is an ethnic identity which is usually held in addition to, not instead of, a more specific identity, such as Mexican American (more than

half of Hispanic Americans), Cuban American, Puerto Rican, Dominican American, Colombian American, or Salvadoran American, and so the category is ethnically as well as racially diverse. Only a small minority of Hispanic Americans are descended from Spanish immigrants to the United States; in fact, some actually have no Spanish ancestry at all.

### **Frauds Targeting Hispanics**

Several studies have focused on issues of fraud that impact the Hispanic American community. A 2005 study, for instance, found that low-income Hispanic immigrants are the most likely victim group of consumer fraud. Inexperience in the American market, which leads to difficulty in assessing the value or likely legality of a proposed exchange, conspires with low English proficiency. Such immigrants are often defrauded in automobile sales, the sale of counterfeit documents (including citizenship papers and other

legal documents), and prepaid calling cards or cell phones.

Language problems are also at the heart of the “notario fraud,” which is a problem throughout Hispanic American communities with large immigrant populations, particularly in New York City, the southwest, and Texas. The Spanish word *notario* is translated into English as notary. In many Latin American countries, a *notario*, or notary, is an attorney, while in other regions, the word is used for certain public offices. In both cases, the *notario* enjoys greater power and authority than a U.S.-based notary, who is not subject to significant testing or regulation and is simply empowered to witness and certify documents, signatures, and depositions. Fraudulent *notarios* may present legitimate credentials as notaries but convince their immigrant clients—or, in an attempt to escape prosecution, simply allow those clients to believe—that they are fully licensed attorneys whose services will assist with the immigration process or with other problems. *Notarios* often use a mix of genuine government forms and fictitious documents in order to create the illusion of activity performed on their client’s behalf. It may be years before the deception is discovered, and often the immigrant, believing they have been following the law under the advice of an attorney, is subject to legal penalties that may include fines, imprisonment, denial of visas or citizenship, or deportation.

Notario fraud has been a problem in the Spanish-speaking immigrant community since at least the 1960s but has been an especially fast-growing crime in the 21st century. The American Immigration Lawyers Association and other groups have launched public service announcement initiatives at raising awareness of notario fraud, while Arizona has passed a law requiring notary publics advertising in a non-English language to clearly state the nature of their work or face felony prosecution.

### Hispanic American Men on the “Down-Low”

About 4 percent of Hispanic Americans identified as lesbian, gay, bisexual, or transsexual in a 2012 Gallup survey, slightly more than the national average of 3.4 percent. This is especially interesting given the phenomenon of secretive bisexuality, or “being on the down-low,” in the

Hispanic community, which has been a topic of increasing study in the 21st century. The down-low, derived from the caution to “keep this on the down-low” (that is, keep this a secret), is a term originating in the African American community to refer to a growing subculture of men who self-identify as heterosexual but have sex with men, and who keep these homosexual encounters a secret from their female sexual partners, their families, and usually most of their social circles outside of the down-low. The down-low has received attention primarily as a black phenomenon, but it is also part of both black and nonblack Hispanic American culture, especially in parts of the country with both large Hispanic and large black populations. Much of the media attention has focused on the human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS) risk posed by the intentional deception of this subculture.

When it was still a primarily black phenomenon, the down-low referred to numerous forms of secretiveness and deception, not necessarily sexual; the term became more specific in response to the development of the subculture. As it has developed in the 2000s and 2010s, the down-low is not just a subculture or a habit but also a sexual identity found in the black and Hispanic American communities. Borne out of the priority placed on masculinity in these cultures, the down-low is a sexual identity which is not truly either homosexual or bisexual, an identity that does not map to the “Kinsey scale” described in white non-Hispanic culture. The down-low culture is a rejection not just of the limits of white heterosexuality but also of an American gay culture that is perceived as predominantly white and effeminate. While sex with men has always occurred in the male Hispanic community, this organized subculture has developed specifically in the late 1990s and especially the 2000s, aided in part by the Internet and cell phones.

Men on the down-low are usually young and often live in the inner cities. Given the disproportionate representation in prison populations of young inner-city Hispanic and black men, it seems likely that prison sexuality plays a role in the perception of sexual identity in the down-low culture. While sex between men is common in prison, it includes not only the prison rapes—physically forced or coerced by threats

or bribes—depicted in the media but also consensual relationships and encounters. It is widely accepted that while men may have sex with other men in prison, this does not challenge or undercut their claim to heterosexuality upon reentering society. Further, it is commonly accepted that men in such positions need not discuss their prison sexual history with female sexual partners. The main difference here is that the down-low lacks the special context of prison in which no other sexual outlet is available.

Most men on the down-low have relationships with women, even getting married and having children, and their reasons for doing so bear only a superficial resemblance to those of the closeted gay men of the 20th century. Sex between men rarely involves a relationship and anonymity is common. There are designated meet-up spots where sex is available. For these men, their masculinity is part of their ethnic identity, which may be why the down-low culture spread from the black community to the Hispanic community, with its history of “machismo.” The down-low’s combination of masculinity, heterosexual identification, and homosexual activity has been compared to the male sexuality of ancient Rome and Greece, where homosexual activity was common and the categories of “straight” and “gay” did not exist.

The Centers for Disease Control and Prevention (CDC) has suggested that bisexual men—defined here by their sexual activity with both men and women, not their sexual identity—are a significant bridge for transmission of HIV to women, and about 25 percent of such men report having unsafe sex with partners of both sexes. The CDC further reported that the greatest risk is posed when bisexual men do not disclose their sex with men to their female partners, although this claim has been challenged by the mainstream gay community. The CDC’s report may be specific to the black community, in which nondisclosing black men who have sex with both men and women have a 14 percent prevalence of HIV infection, which is not only much higher than heterosexuals or disclosing bisexuals but also larger than the prevalence experienced by nondisclosing bisexuals of all other races and ethnicities. It was not clear in the CDC report whether Hispanic blacks were included in the study.

### Truthfulness in Hispanic American Culture

Sociological and psychological studies have found that habits of lying vary from culture to culture, and those differing values may be brought with an immigrant group to a new country. By and large these studies have found that non-Hispanic, white American culture is more willing to lie, and to find the lies of others more acceptable, than Hispanic cultures. A 2007 study found that white Americans rated lies as more acceptable than Ecuadorians did in all six categories of lie included in the study: flattery, impression management, conflict avoidance, enhancement of others’ self-esteem, self-aggrandizement, and instrumental lies. Similarly, a study of Puerto Rican adolescents in 2012 found that lying to parents was infrequent across most categories, though slightly more common when lying about engaging in risky behavior. There was a strong correlation between an individual’s likelihood of telling his parents the truth and the trust he expressed in his parents.

In addition to the deception inherent in the down-low, there is a key exception to this general truthfulness in Hispanic American culture, which is a frequent unwillingness to speak out against members of the community in court or to law enforcement authorities. Again, this has an analogue in the African American community; for blacks living in the inner cities, “snitching” is a deeply held cultural taboo. However, in the Hispanic community this reluctance grows out of *confianza*, a term for the mutual reciprocity and mutual duty of members of the Hispanic American community.

Many immigrant communities have early histories of implicit or explicit systems of mutual reciprocity. These immigrants formed mutual benefit societies to assist each other, and those who came to power extended jobs, loans, and other help to those who had not. *Confianza* may have originated similarly, but it continues as a network of obligations to insiders, often difficult to articulate to outsiders. This has frequently been named as a barrier in criminal investigations and prosecutions, in which even when individuals know wrongdoing has been done, they may be unwilling to speak ill of another community member, or to contribute to their prosecution.

## Historical Narratives, False

Historical narratives reflect the way history has been and is written. Rather than representing past dealings and happenings directly, historical narratives represent how individual historians in the past have interpreted historical events. Historical narratives may be false because of a variety of causes. A historian may choose, of course, to purposefully compose a false historical narrative,

one in which he or she consciously creates facts or events in order to weave a different interpretation than that supported by the existing evidence. An assortment of other reasons, however, may make a historical narrative false that do not rise to the level of outright deception. A misunderstanding of the historical process, the choice of misleading language, intentional or unintentional omissions, misleading audiovisual cuing, or the use of spurious knowledge may cause a historical narrative to be false. As technological advances combine with increased scrutiny by members of the scholarly community, the assertion that certain historical narratives are false will most likely increase.

### Background

Traditionally, narrative was the chief rhetorical device used by historians, representing a way of writing history that followed certain recognized conventions. Historical narrative is organized in a chronological manner, so that events that occurred first in time are placed first in the recounting. In addition, historical narrative typically concentrates on the transmission of a single, coherent story. Eschewing the analytical for the descriptive, historical narratives present what has happened in a manner that explains how and why events occurred. Traditional historical narrative has focused on individuals and their actions, not abstract conditions or situations. Finally, historical narrative has focused on the particular and specific, as opposed to the communal and statistical.

Historic narratives for generations focused on diplomatic, economic, and political history. Beginning in the 1960s, history as a discipline began to move away from the traditional historical narrative and to embrace more of a social science model of analysis, which had its roots in the 19th-century German and French approach to the field. This new approach to history, referred to as *social history*, disdained the traditional approach and instead used demographic, statistical, and other information to craft its analysis. While the number of political historians typically made up approximately 50 percent of those in academic positions, recent estimates show this proportion has fallen to approximately 30 percent, while those identifying as social historians has increased to over 40 percent.

A variety of approaches fall under the term *social history*, including African American history, Chicano history, ethnic history, gender history, history of education, history of the family, history of medicine, labor history, rural history, and women's history. Rather than examining actors and events, social history focuses upon classes and movements, conflicts and revolutions, family and education, inequality, leisure and work, mobility and other such phenomena.

Rather than using narrative, social history instead emphasizes analytical approaches similar to other branches of the social sciences, focusing on quantifiable sources rather than examining events and heroes. In addition to those mentioned above, a variety of other historiographical approaches exist, including comparative history, environmental history, ethnohistory, history of religion, intellectual history, local history, oral history, public history, and quantitative history, among others.

Over the past three decades, cultural history has also become increasingly popular. Like social history, cultural history examines how popular cultural traditions and interpretations inform the historical perspective. Cultural history also examines records and other data sources to examine how the nonelite groups within a society fared, thought, and interacted during certain eras. Cultural history examines such themes as attitude, the body, class, culture, cultural identity, ideology, perception, power, race, and sexual orientation. Examining the manifestations of culture, cultural historians are very interested in how traditional culture adapts to mass media, and consequently there is great interest in print, film, radio, television, video games, the Internet, and other cultural evolutions of human relations.

Historiography examines a variety of topics to determine the veracity and reliability of a given historical narrative. Among the common themes examined are reliability, historiographical tradition, moral issues, interpretation, and historical metanarratives. In examining reliability, the historian's information sources, such as documents, persons, photos, or any other source, are examined in order to assess their trustworthiness within the context of their use. The historiographical tradition or framework indicates the historian's approach to his or her topic, which

might be political, Marxist, social, cultural, or the like, as this explains biases and assumptions in the work. Moral issues involve a resolution or determination of the relative praise or guilt assigned to various parties within the work. The interpretation pursued by a given piece might be orthodox, insofar that it keeps within the previous examinations undertaken, or revisionist, in which case it reinterprets previously accepted situations and occurrences. Finally, historical metanarratives amount to a narrative about narratives, often a postmodern approach that examines grand narratives, often with a good amount of skepticism. Through these examinations, determinations can be made regarding the veracity, or the falsity, of a given historical narrative.

### Misconstruing History

All history depends upon the interpretation of past events by examining information sources that may or may not be complete or comprehensive. As a result, the truth or falsity of any historical narrative is, to a certain degree, a matter of opinion and conjecture. That being said, adherence to principles of historiography increases the likelihood that other historians would be more inclined to accept a given interpretation as compelling, convincing, or at least not flagrantly false. Practices such as peer review, in which other scholars engage in a blind review of a work and indicate its trustworthiness before publication, are some of the other ways that the chance that a historical narrative is false can be reduced. Despite these safeguards, false historical narratives sometimes get published. The falsity of these historical narratives sometimes can be attributed to negligence, incompetence, false logic, omissions, misleading use of language or audiovisuals, or other causes, including intentional falsification.

Historians seek to reconstruct past human activities and to realize a more profound understanding of those activities. Unlike all the other arts and humanities, however, history is part of the human experience. History is a part of consciousness insofar that it represents one's memory of past events. The Greeks recognized this connection by describing Clio, the muse of history, as the daughter of memory. The earliest Western historians, Herodotus and Thucydides, knew that the simplest recitation of events had multiple

ramifications. The ancillary subject matter contained in history, concerning as it does sociology, anthropology, demography, and psychology, reaches to every realm of human existence. Thus history, when deliberately written, suggests general truths for all. To maintain the reliability of these truths, it is imperative that certain guidelines be adhered to as closely as possible.

In the last century, a great desire sprang up for social history, for economic history, and for the newest “new history,” which forsake political and diplomatic feats and motives in favor of great movements of ideas. This pressure was brought in part by the sciences, with their reliance on figures and statistics. Many other subjects compile figures and tables counting selected social acts. It is left to the historian, however, to discover the place and significance of such findings in an intelligible account of some portion of the past.

Some of the difficulties of the modern historian are caused by a rending of the social fabric. History has an empirical look and feel of its own that few other fields of study provide. History, at its best, involves a recital of events and a portrayal of participants. The writing of history requires a pattern because the human mind has difficulty fixing its attention on anything that does not present or suggest form. History thus presents incidents in clusters that follow rationally from one another. Historians often use time as a guide, roughly dividing it into reigns, centuries, and eras. In American history, decades and presidential terms are often used as such a guide. Historians create these classifications, and thus they always remain open to some criticism.

To be successful, a classification must fairly correspond to the mass of evidence and offer a graspable design to the beholder. Before and during the 1960s, historians became interested in groups that had been overlooked or ignored: African Americans, women, Native Americans, and Mexican Americans. In response to this, other groups, also ignored, began to be studied, such as the French, the Irish, and Scandinavians. Further subgroups began to be studied, such as women and music, women and the professions, and women and law. An abiding search for the truth above all governs the historian.

Often, however, the historian is faced with a report of suspicious nature in an otherwise

reliable source; what is to be done? A reasonable person might (1) accept the item because of the periodical's reputation, (2) reject the information as absurd, (3) suspend judgment pending more information, or (4) ignore the problem all together. The good historian would do none of the above but continue to investigate. Verification ranges from tasks as diverse as ensuring an author's name is cited correctly to ensuring that a document is genuine. Ultimately, the historian arrives at the truth through probability. In certain cases, only an expert has the knowledge to judge the authenticity of a source. Dumas Malone, a professor at the University of Virginia, was known for his observation that Thomas Jefferson's writing contained more radical wording when writing to younger men. This expertise came from years of study and work.

### Levels of Deception

Historians can mislead through a failure to tell the entire story. This deception can take place when the historian makes selective use of the evidence, including those portions that support his or her narrative but excluding those that do not. Similarly, a historian may choose to rely heavily on evidence that is little more than hearsay to the exclusion of other evidence that is more dispositive. Additionally, historians using transcripts or audiovisual material can manipulate the veracity of their narrative by omitting key portions of what they are presenting, such as leaving out key material that could show information in a different light. Even something as seemingly benign as selecting photographs can obfuscate the truth. This occurs when outright fraud is committed, such as when someone chooses to use a software program such as Photoshop to manipulate an image. Visual vilification may also occur, however, when a particular image is selected in an attempt to make the subject appear in an unflattering light.

A historical narrative can be made less reliable by other means that are more subtle, but no less damaging, to those interested in pursuing truth. Misleading use of language, or manipulation of certain passages, can also vitiate the veracity of a historical narrative. Far too many historians engage in loaded language, which predisposes readers to draw certain conclusions based upon

the choice of words. For example, speaking of Catholics in Northern Ireland as “terrorists” as opposed to the “Irish Republican Army” can provoke a very different response in readers. Problems and effects are sometimes overstated, as when discussions about gun ownership purport to establish certain levels of ownership that cannot be established.

A variety of conspiracy theories, faulty causation links, and guilt by association can also impugn a historical narrative’s veracity. Conspiracy theories, such as those regarding the John F. Kennedy assassination, certainly are of great interest but often rely upon the suspension of disbelief. Faulty causation links mistake correlation, in which two events occur simultaneously, for an underlying reason that made something happen. The two are quite different, but correlation is quite often mistaken for causation. Guilt by association may result in the condemnation of individuals or causes because of an awareness of or acquaintanceship with an evildoer, even though no evidence exists that the individual or cause accepted the positions of the other.

### Consequences of False Historical Narratives

Good historical narrative is based upon a truthful examination of various facts. The consequences for those who are found, or even suspected of, making false statements in a historical narrative can be severe, sometimes resulting in admonitions or censure, sometimes ending careers. Prominent historians such as Stephen Ambrose and Michael Bellesiles have had their reputations placed under severe attack as a result of allegations of intentional falsehoods in their work. Because so much stock is placed in the truthfulness of scholars, mere allegations of falsifications often result in damaging consequences and penalties.

Ambrose was a longtime professor of history at the University of New Orleans, and the recipient of the National Humanities Medal, the George Marshall Award, the Department of Defense Medal for Distinguished Public Service, and various other honors. Ambrose, who wrote about the Civil War, Dwight D. Eisenhower, World War II, and a variety of other topics, was highly popular with the general public, with many of his books becoming best sellers. The Home Box Office (HBO) series *Band of Brothers* was based upon

Ambrose’s book of the same name and won an Emmy Award from the Academy of Television Arts and Sciences.

After the great success of this and other projects, allegations came to light that Ambrose had plagiarized the work of other historians, with an investigation by *Forbes* magazine alleging that six of his books borrowed from the works of others. Later, Ambrose was also accused of falsifying details related to his relationship with Eisenhower, of whom he wrote the authorized biography, inflating the amount of time he had spent interviewing the former president and misstating facts in other works. Although he died shortly after these charges came to light, Ambrose’s reputation has never recovered.

Bellesiles was a professor at Emory University and was awarded the Bancroft Prize for his work *Arming America: The Origins of a National Gun Culture*. The Bancroft Prize is awarded by Columbia University to the best book regarding diplomacy or American history, and it is considered highly prestigious. Bellesiles’s critically acclaimed book asserted that guns were uncommon in much of the United States’ peacetime history and only became common following the Civil War.

In part because the book supported the anti-gun lobby, Bellesiles was feted upon its publication. Investigations of his work, however, turned up numerous allegations of misrepresentations, inaccurate citations, and falsehoods. Certain San Francisco probate records Bellesiles claimed to have consulted, for example, turned out to have been destroyed in the earthquake of 1906, and he reported a mathematically impossible mean for gun ownership based upon probate records.

As a result of an investigation, Bellesiles was stripped of the Bancroft Prize and resigned from his professorship at Emory. Although he has since published another book, Bellesiles has not accepted another tenure track position. The consequences of false historical narratives are thus harsh, serving as a warning to others not to commit academic fraud or to be sloppy in establishing one’s citations or evidence.

## History of Deception: Ancient Civilizations

Telling the truth and lying are as ancient as humanity. Beliefs that “it is wrong to lie” or “deception is evil” have been expressed in many ways through the ages.

In the ancient Middle East, King Hammurabi (1795–50 B.C.E.) issued his famous code. The code was preserved on a black stone monument that was recovered in 1901. Among the many laws it lists are two on bearing false witness. In a capital case a witness who could not establish the statements he has made was to be put to death. In other criminal cases a false witness would suffer the punishment that the perjurer had sought for the counterlitigant.

In a civil case, false witnesses were to pay the damages of the suit for their perjury. However, immoral acts, such as lying, using false weights, or other forms of deception, were not cases that were brought into court. Instead these acts were severely denounced in the Omen Tablets as likely to incur the wrath of the gods rather than the punishing hand of the king.

### Biblical Discussions of Deception

The Bible contains many cases of deception, from false weights used in measurements to outright lying. The Hebrew word for deception or falsehood is *seger*; the word for lie is *kazab*. In general, the biblical writers severely condemned lying, especially if the lie was used to perpetrate a fraud (Leviticus 6:2–3). Other biblical passages exhort believers not to lie, deceive one another, or “swear falsely” by the name of God (Leviticus 19:11–12). The prophets condemned lying as an expression of the principle of evil (Hosea 12:1), so it was condemned as unacceptable to the conscience of ancient Israel and above all as contrary to the divine nature.

The story of the emergence of evil into the human condition is found in Genesis 3:1–7, which tells how the Serpent lied to Eve by telling her that God’s ban on eating the forbidden fruit of the Tree of the Knowledge of Good and Evil was not true. The Serpent lied about the ban, and the consequences of this lie involved Eve (and subsequently Adam) in a radical change in the human condition.

Another story of deception from Genesis (12:10–20) involves Abraham and his beautiful wife Sarah. Forced to go to Egypt because of famine, he persuaded her to tell the Egyptians that she was his sister in order to protect his life. Believing that she was a free woman, she was taken to the Pharaoh’s harem until the deception was revealed to the Pharaoh following an outbreak of plagues in his house.

Isaac, the son of Abraham, practiced a similar deception with the Philistines (Genesis 26:1–11) in order to protect his life. His lie that Rebecca, his wife, was his sister was revealed when he was seen fondling her. His deception was more than matched by his son Jacob, who deceived his nearly blind father in order to steal Esau’s (his brother) blessing from Isaac (Genesis 27:1–40). Jacob is himself deceived when he is given his beloved Rachel in marriage, only to discover that his wedding night has been spent with her crossed-eyed sister, Leah (Genesis 29:15–30). Rachel rewarded her father’s duplicity years later with her own. She stole her father’s household goods. When he searched her tent she sat on the goods and lied that she was menstruating, so she was not required to get up (Genesis 31:33–35).

The patriarch Jacob was deceived by his sons when he was shown the coat of many colors that belonged to his favorite son, Joseph. The sons lied that the torn and bloody coat was all that was left, when they knew that they had sold Joseph into slavery and he had been taken to Egypt (Genesis 37:1–36.). After this, one of Jacob's half brothers, Judah, was deceived by his daughter-in-law, Tamar (Genesis 38:1–30). Years later Joseph, who has become virtually the second-in-command in Egypt, hid his identity from his brothers until he could examine their loyalties (Genesis 43–45).

In Exodus (1:8–22), the service of Joseph to Egypt had been forgotten and the new Pharaoh, fearing the disloyalty of the Hebrews, tried to suppress their birth rate as a matter of national

security. He ordered the Hebrew midwives, Shiphrah and Puah, to engage in male infanticide. However, they disobeyed his orders and when questioned lied that the Hebrew women were so strong that they delivered before midwives could arrive. Their lying is not condemned biblically, but they are blessed.

The book of Judges describes the deception practiced by Ehud in the assassination of King Eglon. Ehud was a left-handed Benjamite who wore his sword on his right hip rather than the left side, as right-handed warriors would. Although searched on the left, his sword was not discovered when he came to King Eglon on the pretense of giving a gift. He left the gift and then acted as though he were leaving the palace but then suddenly came back and asked for a secret

In an 1860 painting, the Greek philosopher Diogenes (404–323 B.C.E.) sits in an earthenware tub in the Metroon, Athens, lighting the lamp with which he was to search for an honest man in daylight. The problem of truth as an aspect of knowledge became critical to Greek philosophy as Sophists attacked truth, claiming that “man is the measure of all things,” a principle that reduced truth to subjective whim.

audience with King Eglon. The private audience was granted. Ehud drew near to the king, pretending to whisper a message. Instead he drew his sword and drove it into Eglon's fat belly, which killed him. Ehud then escaped to rally the Israelites to battle.

While there are numerous examples of deception in the Bible, the Mosaic Law given in the Ten Commandments prohibits bearing false witnessing (Exodus 20:16 and Deuteronomy 5:20). Other sundry laws include giving false reports and engaging in other deceptive practices (Exodus 23:1–3). Wisdom literature denounced false swearing: Do not witness against your neighbor without cause (Proverbs 24:28); the Lord hates false witness (Proverbs 6:19); a false witness will not go unpunished (Proverbs 19:5); a false witness will perish (Proverbs 21:28); and a worthless witness makes a mockery of justice (Proverbs 19:28). The prophets frequently denounced fraud and deception: “those who by a word would make a man out to be guilty” (Isaiah 29:21); “the rogue ruins the poor, whose plea is just, with lying words” (Isaiah 32:7).

Deception in business practices is also denounced in many biblical passages. Some of these are part of the Law of Moses, such as “Do not have different sets of weights and measures” (Deuteronomy 25:13–15). Others are in the wisdom literature: Differing weights and measures are an abomination to the Lord (Proverbs 20:10); the Lord hates dishonest scales (Proverbs 11:1). Other passages are part of the prophetic literature: a trader with false balances (Hosea 12:7); cheating with dishonest scales (Amos 8:5; Micah 6:11); to make the *ephah* small and the *shekel* great (Amos 8:5); can I acquit the man with wicked scales and a bag of deceitful weights? (Micah 6:11); the scant measure that is cursed (Micah 6:10).

In the Gospels, passages report that false testimony was sought against Jesus by “the chief priests and Council” (Matthew 26:59), and “many false witnesses came forward against Jesus” (Matthew 26:60; Mark 14:56–7). In the Gospel according to John (8:44), Jesus declares that Satan is the father of lies. In the book of Acts (6:13), Stephen became the first Christian martyr because of false testimony. After Ananias and his wife Sophia lied about their self-promoting

donation, both subsequently dropped dead (Acts 5:1–11). The First Letter of John (1 John. 2:22) says that lying is the sin of the Antichrist. The book of Revelation (21:27) excludes all habitual liars from heaven as those who have forfeited eternal salvation.

### Lying in Other Ancient Cultures

In ancient Egypt, *maat*, the fundamental order of creation, was an organizing principle of behavior. The New Kingdom produced a work called “The Tale of Truth and Falsehood” (“The Blinding of Truth by Falsehood”), an allegory that transforms the conflict between Horus and Set. These gods are unlike the Mesopotamian trickster god Enki, who saves mankind. In the New Kingdom the scarab beetle came to symbolize the heart that would be judged after death. Scarab amulets were inscribed with spells to protect one from lying.

The Greek word for lying is *pseudos* and its cognates. Ancient Greek laws expressed concern for falsehood with statutes dealing with moving boundary markers. Greek mythology contributed many examples of deception: Odysseus built the Trojan horse and later deceived the Cyclops. The ancient Greeks also had their own spirit of deception, *Apate*, the goddess of deceit, guile, fraud, and lies. Her male consort was *Dolos*, the *daimon* of trickery. *Apate* was also the companion of *Pseudologoi* (lies), which was the opposite of the spirit of truth, *Aletheia*.

The problem of truth as an aspect of knowledge became critical to Greek philosophy in the face of the Sophist attacks on truth. The Socratic school struggled against Sophists, such as Protagoras, who claimed that “man is the measure of all things.” This principle basically reduced truth to subjective whim, which allowed deceit in the Sophist ethic of success. In Plato's dialogues, the *Craytalus*, *Theaetetus* and the *Sophist*, Plato's Socratic character struggled with the problem of falsehood. Aristotle wrote against sophistries in *De Sophisticis Elenchis* (*On Sophistical Refutations*). Diogenes the Cynic carried a lighted lantern around Athens in the bright noonday sun looking for an honest man. On Crete, Epimenides of Knossos paradoxically claimed, “All Cretans are liars.”

In China in the time of the Warring States (ca. 479–221 B.C.E) the School of Names (also

known as The Logicians or *Míngjia*) grew out of Mohism. This group's philosophy is believed to have been similar to that of the Sophists. Most of their works are no longer extant. In contrast, Confucius said in the *Analects* (2.22), "I do not see what use a man can be put to, whose word cannot be trusted." Also in the era of the Warring States, military authors, such as Sun Tzu, Sun Pin, and others, recommended the use of guile and duplicity and other forms of deceit in order to achieve military goals. They also urged the use of spies in order to know their opponents. The Chi'n armies led by Sun Pin followed the maxim, "be deceptive."

In India, the Laws of Manu condemned lying because it causes serious destruction. The bold statement about lying in *Manu* (4.256) was that all things are determined by speech; speech is their root, and from speech they proceed. Therefore, he who is dishonest with respect to speech is dishonest in everything. The Jain *Upasakadasanga Sutra* stated that falsehood implies the making of a wrong statement by one who is overwhelmed by intense passions.

## History of Deception: Medieval Period

The death of Saint Augustine, bishop of Hippo, in north Africa in 430, has been used by historians to mark the end of the ancient world and the beginning of the Middle Ages. Augustine's teachings were to have a profound influence on the medieval Western world. His work *De Mendacio* (*On Lying*) continues to influence many people today.

### Saint Augustine's Views of Lying

Saint Augustine defined lying as having one thing in one's heart and uttering another with the intention to deceive. This definition from *On Lying* stresses that lying is intentionally seeking to deceive. In his work *Enchiridion*, the definition of lying is speaking the opposite of what liars have in their hearts with the purpose of deceiving others. For Augustine, a lie is also a sin, even if it is uttered in order to do a service to someone.

Augustine believes the problem of lying is best addressed by absolutely forbidding all lies. He rejects all forms of justified lying. This includes lying to enemies, to the sick or dying about their condition, or even to protect others.

Augustine taught that there is an eight-fold distinction between types of lies. The worst of all lies are those lies uttered in teaching of religion. The second type of lies are those that injure people unjustly. A third type is beneficial to one person and harmful to another. The fourth type is the "real lie," which is told solely for the pleasure of deceiving. The fifth type is told to please others in order to smooth conversations and relations. The sixth type of lie harms no one, but benefits someone (for example, the lie to protect someone from harm). The seventh type is the lie that harms no one, but protects someone from harm, such as a man sought for capital punishment. The least offensive lies are those that harm no one but save some people from physical defilement. In cases where lying saved people from harm, the lie can be pardoned and the good intentions praised. Augustine sees a lie that harms someone in order to protect someone from injury as a separate question of whether it is ever right to harm someone.

Augustine primarily opposes lying because it is contrary to the Divine purpose of human speech. His influence was enormous, because prior to his time Christian opinion was very divided. Many people, finding the many examples of deception in the Bible, saw them as permission for lying, but Augustine's stance opposed all lying. His absolute opposition was then worked out as the Middle Ages advanced. However, his absolute prohibition on lying was very hard to live by. Eventually three approaches to deception emerged: forgiveness for lying, cagey phrasing that denied it was lying, and the claim that some falsehoods did not count as lies.

### Ordeals to Determine Truth

Augustine's views reappeared in the early penitentials. For Christians to bear false witness in court was a very serious form of deception. The *Penitential of Cummean* required lengthy penances for acts of perjury. In England and other places, oaths in legal proceedings could be backed by some form of ordeal. One form of ordeal was the *iudicium aquae frigidae* (ordeal by cold water). Whether trial by water, combat, poison, or fire, the goal was to separate truth from error, especially the deliberate error. The ordeal was inherited by European societies during the Middle Ages, but it was used in many other places from Japan to Polynesia to Africa and Iceland. An example of ordeal by boiling water was recorded in the Viking epic *Poetic Edda*.

Charlemagne supported the ordeal as a method for separating lies from truth. In contrast to ordeals were oaths that were often not accepted as conveying a sufficient amount of penitence. However, some oaths, if sworn on holy relicts, were accepted. The growth of learning among the clergy would eventually lead to the abandonment of ordeals.

### Thomas Aquinas

Among the most learned of the clergy was Saint Thomas Aquinas. In his *Summa Theologica*, Aquinas dealt with the problem of lying in his discussion of "Whether Lies are Sufficiently Divided into Officious, Jocular and Mischievous Lies?" Officious lies are told for some useful purpose. Jocular lies are told in order to make fun. Mischievous lies are told in order to inflict injury. Aquinas concludes that these are all real lies; however,

following Aristotle's *Ethics*, he sees lies as "boasting" and "irony." Boasting lies go beyond the truth, while ironic lies stop short of the truth.

Aquinas sees lying as sinful. It increases in sinfulness if it is intended to harm someone (mischievous lie). It decreases in sinfulness if it is intended to achieve some good (jocular lie), and it is an officious lie if it is intended to save or protect someone. In all, the greater the harm intended, the more grave the sinfulness of the lie, but in contrast the greater the good intended, the less grave the sinfulness of the lie.

### Logical Fallacies

With the renewal of learning after the Dark Ages, the study of Aristotle's *Sophistical Refutations* led to the assignment of Latin names to many informal fallacies; most of them seek to deceive by illogically appealing to the emotions, manipulating language, or some other trick of thought. These informal fallacies, or *argumentum*, included *argumentum ad baculum* (threat), *ad crumenum* (appeal to money), *ad hominem* (attacking someone instead of refuting them), *ad ignorantiam* (appealing to the absence of evidence), *ad lapidem* (dismissing a statement as absurd without giving proof of its absurdity), *ad misericordiam* (appealing to pity), *ad novitatem* (new is better), *ad populum* (appeal to the people), *ad antiquitatem* (appealing to age), *ad lazarum* (appealing to poverty), *audiatur et altera pars* (jumping to conclusions), *cum hoc ergo propter hoc* (false cause), *non causa pro causa* (phantom false cause), *dicto simpliciter* (sweeping generalization), *non sequitur* (does not follow), *petitio principii* (loaded question), and *tu quoque* (appeal to hypocrisy).

Deceiving and lying to the enemy during a war is an ancient practice. It has been supported by generals and many others who have practiced as many tricks of deception as possible. The military tactics of camouflage, feinting movements, spies, disinformation, and other deceptions were used in the Middle Ages. Lies uttered in a crisis were also accepted. Byzantine diplomacy was noted for its duplicity.

### Lying in Non-European Cultures

In Arabia the religion of Islam emerged with the Koran saying that words and deeds should match: "O you who believe, wherefore do you say what you do not? Very hateful is it to God, that you say

what you do not” (Sura 61:2–3). Lying is unacceptable to Allah, and the Hadith (the collection of the Prophet Muhammad’s sayings) note that hypocrites are liars who make false promises, act treacherously, and betray the trusting.

In India, the Dhammapada of Buddhism condemned speakers of falsehoods, who would reach purgatory, where they would lie about their misdeeds. There is no evil that cannot be done by the liar, who has transgressed the one law of truthfulness and who is indifferent to the world beyond.

The Maharatnakuta sutra, a Buddhist scripture, describes liars as people who lie to themselves as well to the gods. Lying is the origin of all evils according to the Bodhisattva Surata’s *Discourse*. Lying leads to reincarnation in the miserable planes of existence, to the breach of the pure precepts, and to corruption of the body.

The Mahabharata, which was finished around 400 C.E., is an epic poem that includes the great devotional hymn the Bhagavad Gita. It features the hero Arunga discussing life with Arjuna, his charioteer, who is actually Krishna. The stories of Krishna feature his childhood lies and other tricks; he is a trickster god. Examples of deceiving tricksters are found in many places.

For example, in African stories the trickster is a mythic character who lives deceptively by his wits. Characters include Ture of the Pygmies, Anansi the Spider, and the Hare (who became Brer Rabbit in the Uncle Remus stories). The African god Eshu was a trickster who would bring chaos. He is capable of changing shapes and of confusing people. Eshu is known as Legba in Nigeria. He is like the Norse god Loki, who practices deception in many myths.

The myths of Native Americans included many tricksters that were usually god animals. They were quite often malevolent and aggressively oversexed. Among the many tricksters are Raven (Haida of Queen Charlotte Islands), the coyote, and the rabbit. A piece of Mayan pottery pictures a rabbit stealing clothing. An Aztec trickster was Centzon Totochtin, whose name means “four hundred rabbits.”

The Popol Vuh tells of the Mayan twin gods, who are cultural heroes. They engage in numerous deceptions. Widespread in the American Southwest is Anasazi rock art, including pictographs or petroglyphs of Kokopelli, a hunchbacked figure

who is a deceiving and lecherous musician with a flute. The Lakota Sioux trickster was Iktomi, a spiderman, who was more of a trickster god than an animal spirit.

### Lying in Medieval Literature and Philosophy

Lying was addressed in many literary works of the Middle Ages, including those of Geoffrey Chaucer, William Langland, John Gower, and the Patience poet. These works examined a variety of types of speech, including political, social, and private speech, that was deceptive and sinful. Some works on courtly love also addressed lying.

A major issue for centuries was the double truth doctrine, which gained currency in Latin-speaking countries from *On the Harmony Between Religion and Philosophy*, written by the Arabian philosopher Ibn Rushd (Averroes). The double truth doctrine was central to the teachings of Siger Brabant, a French Scholastic and Latin Averroist of the 1200s. The key influence was ultimately from the neoplatonism that had entered Islamic philosophy, teaching a type of monism that was mistaken for monotheism. Viewing the divine as overflowing downward in a series of steps to humans, the double truth doctrine taught that theologians could use allegorical interpretation of scripture to hide their lack of faith while teaching a literalistic truth to the simple laity. In other words, it was possible for religion and philosophy to arrive at contradictory statements about the truth without any detriment.

## History of Deception: Renaissance

The Renaissance (from the French for “rebirth”) was a cultural movement of invigorated activity and innovation in the arts, sciences, and humanities, which began in Italy in the late Middle Ages before being transmitted to the rest of Europe through the 17th century. It was simultaneously forward thinking, having been enabled in part by technological achievements like the printing press, and neoclassical, characterized by a new appreciation of the culture and cultural products of ancient Rome and Greece, made newly available thanks to contact with the Islamic world, which had preserved them in translation.

The Renaissance was a time obsessed with appearances and underlying realities, as the sciences became sophisticated enough to examine more than the naked eye could behold, or could reveal how the senses could deceive reason; as the works of Aristotle and Plato were rediscovered, and formal logic and mathematics were prized; as painters and sculptors brought a rigor to their art that made commonplace a level of realism that had not previously been attempted. The revitalization of humanism shifted focus from idealism, which considers things as they should be, to realism, which examines things as they actually are.

Further, it was a time when commerce, science, and politics created new realms of bureaucracy and clerical work, which in turn provided opportunities for counterfeiters, forgers, and unethical contracts. The concern with appearances in the

Renaissance wasn't just superficial. In an era late enough to develop something of a middle class and a non-noble upper class, but early enough that none of the modern means of proving creditworthiness existed, merchants used the appearance of a customer to gauge whether credit should be extended to them. For this reason, there are several historical cases and many more fictional cases of strangers arriving in town in expensive attire and, because of the illusion of wealth, being treated to a life of splendor and deference to which it turns out they are not entitled.

### Renaissance Politics

It was also a time of sophisticated politics, as the rise of artisan and merchant guilds created a private sector with political power, from which families like the Borgias and Medicis arose to dominate much of Italy. Modern notions of diplomacy and espionage originate in the Renaissance, and Niccolò Machiavelli's *The Prince* made a science of manipulation and propaganda.

Late-medieval Italy was not a single political entity but rather a group of city-states and territories, notably Milan, Genoa, the Kingdom of Naples, the Republic of Florence, Venice, and the Papal States controlled by the pope and the Catholic Church. Italy was the most urbanized part of Europe, with densely populated cities among and on top of ancient Roman ruins. The Italian kingdoms transitioned out of feudalism into a political and social system in which there was a strong antimonarchial feeling, and most of the power was held by merchants. As culture flourished, first in Florence and then in the rest of Italy and Europe, virtues such as fairness and liberty were praised and were attributed to the region's political system, which held the avarices of both Church and Crown at bay.

Though government was responsive (with some democratic features, though that case should not be overstated), it was oligarchical, and intrigue, deception, and political maneuvering were the order of the day. This intrigue has sometimes been overdramatized; the accusations families and guilds leveled against each other should not be taken at face value. But certainly it was an age in which the spy and the diplomat became more valuable and more professional, their skills the subject of study and discussion.

It was in this context that Machiavelli wrote his book *The Prince*, a late example of the medieval genre called *specula principum*, meaning “mirrors for princes.” These were early self-help books aimed at rulers, prescribing advice for rulership and effective governance. Many early texts used history as an illustration, providing advice for how to avoid historical calamities and how to emulate historical successes. Machiavelli’s *The Prince* was written around 1513, though not distributed until 1532, after his death, and is one of the first works of modern political philosophy. Grounded not in moral instruction, the work emphasizes the need for realism in politics, the need to understand how people actually behave, and how they may be manipulated in order to achieve a desired goal. *The Prince* presents no ethical or political goals or values and in this broke tradition with political philosophy to that point.

### Art Forgeries and False Messiahs

While the medieval era had seen a boom period for trade in illegitimate holy relics, in the Renaissance era wealthy merchants and princes sought to amass collections of classical sculptures and statuary. This led to a market for forged classical art. The presence in the marketplace of forgeries led the new class of classical scholars to better their craft in order to discern the difference between the authentic item and the forgery, requiring examination at a level of detail for which there might not otherwise have been motive. This in turn also led to better forgeries. Some of the most successful forgers were scholars themselves, like the priest Giovanni Nanni, one of the fathers of critical tradition, who used his understanding of historical documents to create an expert forgery of ancient texts that exaggerated the importance of his own hometown, Viterbo.

Michelangelo himself, who would be remembered as one of the two greatest artists of the era, sold a Cupid sculpture he made when he was a young man, which he eroded with acidified dirt in order to make it appear older. Too unknown to earn significant money with his own work, he attempted to sell it as an antiquity—and when discovered, the cardinal who purchased the Cupid was so impressed by the quality, given Michelangelo’s youth, that he neither pressed charges nor demanded Michelangelo return the money.

It was an era of numerous imposters of various kinds. Portuguese mystic Solomon Molcho was burned at the stake in 1532 for declaring himself the Jewish Messiah. A German named Asher Lammlein proclaimed himself the forerunner to the Jewish Messiah in 1502 and made a series of prophecies which led to a popular movement for some months before he suddenly disappeared, his claims unfulfilled. The 15th-century Spanish scholar Moses Botarel also declared himself the Messiah, claiming that the prophet Elijah had appeared to him and anointed him.

### Pretenders to the Throne

Many impostors presented themselves as heirs to one throne or another. Tile Kolup claimed in 1284 to be the Emperor Frederick II, one of the most powerful rulers of the Holy Roman Empire, who had died in 1250, but whom rumor had suggested ever since was still alive. Kolup briefly found support in the town of Neuss (though it is not clear he was even old enough for the claim to be convincing), but after an unsuccessful siege on King Rudolph of Habsburg, he was captured and executed.

Perkin Warbeck presented himself as the rightful king of England in the late 15th century, claiming to be Richard, Duke of York, the younger son of Edward IV, and one of the “princes in the Tower” who were exiled to the Tower of London and presumed murdered when Richard, Duke of Gloucester, took the throne. Warbeck presented a serious threat to the reign of Henry VII, whose treasury was troubled enough without the expense of fending off a possible coup. Warbeck’s claim persisted from 1490 to 1497, at which point he was captured and imprisoned in the Tower of London. He was hanged two years later. Some historians believe he may have been an illegitimate son of Edward IV, given his strong resemblance. Henry VII had previously been forced to deal, two years into his reign in 1487, with Lambert Simnel, a 10-year-old boy sponsored by a priest, Richard Simon, who presented him as the Earl of Warwick, nephew of Edward IV. Simnel’s claim was brief-lived and used as an excuse by Yorkist rebels.

When the Russian czar Ivan the Terrible died, three different pretenders to the throne claimed to be his youngest son, Tsarevich Dmitry, who

A detail of a 17th-century engraving by Abraham Bosse features French actor Tabarin performing at a street fair. Tabarin (real name Anthoine Giraud) was the epitome of the “charlatan,” a term coined in Paris in the 16th century to describe men who combined street theater with fraud, using improvised stages to launch performances and sell quack medicines. Tabarin worked the Place Dauphine while dressed as a clown in the manner of Punch, selling snake-oil cures along with his brother, the “Docteur Mondor.”

had been assassinated in 1591. The first of these, False Dmitry I, who ruled as tsar of Russia from July 21, 1605, until May 17, 1606, does seem to have had a physical resemblance to the real Dmitry. He was able to gain the support of important nobles and church figures in order to oust Tsar Boris Godunov, who had ruled as regent since the death of Ivan’s son Feodor in 1598. False Dmitry was accepted by Maria Nagaya, the real Dmitry’s mother, and the Godunov family was executed, while powerful noble families whom the Godunovs had exiled were pardoned, giving the new tsar important allies. Rumors that Dmitry was going to reunite the Russian Orthodox Church with the Catholic Church garnered him enemies who succeeded in overthrowing him after 10 months.

The other false Dmitrys did not dispute False Dmitry I’s claim; rather, each of them claimed in fact to be Tsar Dmitry, having survived his assassination attempt. The first appeared in June 1607, a year after False Dmitry I’s death, and allegedly “confessed” under torture that he was Dmitry.

He was sponsored by Jerzy Mniszech, father of the False Dmitry I’s widow Marina, who publicly accepted False Dmitry II as her husband and privately married him in a secret ceremony in order to assuage her conscience. False Dmitry II never took the throne, despite several attacks on Moscow, and he was killed in 1610 by a young prince he had ordered punished. The final False Dmitry appeared a few months later in March 1611, proclaiming himself Dmitry Ivanovich in the town of Ivangorod. A year later, the Cossacks had acknowledged him, but before his support could grow, he was secretly executed by the Russian government on May 18, 1612.

### Charlatans

The word *charlatan* was coined in this era, in Paris in the 16th century, where the men who became known as charlatans combined street theater with fraud, erecting improvised stages on which they would both entertain and attempt to sell quack medicines. The most famous was Tabarin, real

name Anthoine Giraud, who worked the Place Dauphine, playing the hurdy-gurdy, dressed as a clown similar to Punch, and giving performances similar to those of the Italian commedia dell'arte. The patter, music, and entertainment drew crowds, to which Tabarin and his brother would sell their snake-oil cures, much as charlatans at medicine shows in the United States would do two centuries later.

## History of Deception: 1600 to 1700

Discussions of lying and deception can be found in the works of a number of philosophers in the 17th century. Many of these philosophers may be said to hold an absolutist position on lying and deception because they wrote that lying and deception were never morally permissible. Even those who apparently defend lying argued instead that permissible lies are not truly lies.

In his essay "On Truth" (1625), Francis Bacon (1561–1626) says that, "A mixture of a lie doth ever add pleasure." Here he would appear to

mount a defense of harmless lies that add color to people's lives:

Doth any man doubt, that if there were taken out of men's minds vain opinions, flattering hopes, false valuations, imaginations as one would, and the like, but it would leave the minds of number of men poor and shrunken things, full of melancholy and indisposition, and unpleasing to themselves?"

However, further into the essay Bacon argues that even if lies can make things go more smoothly, they are to be resisted because lies remain shameful and base:

. . . clear and round dealing is the honor of man's nature, and that mixture of falsehood is like alloy in coin of gold and silver, which may make the metal work the better, but it embaseth it . . . There is no vice that doth so cover a man with shame, as to be found false and perfidious.

Taking a lie to be "a breach of faith," Bacon agrees with Michel de Montaigne (1533–92) that a liar "is brave towards God and a coward towards men."

#### Hugo Grotius

By far the most thorough discussion of lying and deception in the 17th century is to be found in *The Law of War and Peace* (1625), a treatise in just war theory, by Hugo Grotius (1583–1645). Book III of this work is devoted to questions of *jus in bello*, or justice in the conduct of war. Here Grotius asks the question of whether it is morally permissible to use a "ruse" in (just) war. He is not talking about making an insincere promise to an enemy, or *perfidy*, something that he holds is always morally impermissible, because in making a promise a promisor confers a right upon a promisee, and hence an insincere promise is always a violation of another person's right. He is also not talking about making insincere or false oaths, which he holds is also always morally impermissible because oaths are made to God.

Rather, Grotius is talking about deception in general and lies in particular. His answer to the question of whether it is morally permissible to

use a ruse in war depends, as he says, on “whether deceit belongs to the class of things that are always evil,” or whether “it is in the category of things which from their very nature are not at all times vicious but which may even happen to be good.”

Deceit “in a negative action,” or negative deception, by which he means merely concealing the truth, or keeping a secret, is morally permissible. This, he notes, is not even considered to be deceit by others. Deceit “in a positive action,” or positive deception, by which he means intentionally causing false beliefs, he divides into two kinds: nonlinguistic deception (of which there are two types) and linguistic deception. Anticipating Charles Sanders Pierce’s division of signs into icon, index, and symbol, Grotius distinguishes between deception that uses “signs” that work by “resemblance,” such as “hieroglyphic signs” (icons); deception that uses signs that are “acts,” such as what is “uttered by a person in grief” (indexes or natural signs); and deception that uses signs whose meanings are formed “by mere arbitrary convention,” which is “what is spoken, or written, or indicated by signs or gestures,” which includes “signs, as among dumb persons” (symbols).

The first kind of positive deception, that is, nonlinguistic deception, of either type, using resembling icons or naturally signifying indexes, is certainly morally permissible in war. He gives as examples, “the Romans who threw bread from the Capitol into the posts of the enemy that they might not be believed to be distressed by famine” and “a pretended flight” by an army. Because “flight itself has no significance by agreement, although an enemy may interpret it as a sign of fear,” it is not a case of “falsehood in the true sense.” Importantly, the use of “the weapons, standards, uniforms, and tents” of the enemies is also not considered a falsehood.

The second kind of positive deception, linguistic deception, using symbols, is “falsehood in the true sense,” or lying. According to Grotius, lying involves intentionally making untruthful statements: “that which is consciously uttered with a meaning that is at variance with the idea in the mind.” One is not lying if one is simply “ignorant” of the truth. However, one is lying so long as one believes that what one is saying is untrue, even if it is indeed true: “he does not lie who says

something untrue which he believes to be true, but he lies who says that which is indeed true but which he believes to be false.” Furthermore, lying must be unambiguous: what is said “cannot be understood otherwise than in a sense which differs from the thought of him who uses the means of expression.” Finally, although this is implicit in his account, lying must be deceptive.

It is at this point that Grotius introduces a “stricter meaning” for lying. Lying in the strict sense involves an infringement of a “right of him to whom the speech or sign is addressed,” where this right is “nothing else than the liberty of judgment.” Someone who possesses the liberty to judge for himself about matters has the right to be provided with the truth (or at least, what is believed to be the truth) from others when they address him. One can only lie to someone who possesses such liberty of judgment. To lie to someone is to intentionally make (unambiguous) (deceptive) untruthful statements to someone who has the right not to be addressed in this way. That is, lying in the strict sense always involves violating this right.

Furthermore, lying in the strict sense is “harmful.” Hence, to lie to someone is to intentionally make (unambiguous, deceptive) untruthful statements that harm with their deceit to someone who has the right not to be addressed in this way. Although Grotius sometimes talks of morally permissible lies or falsehoods, it seems that his position is that such permissible untruthful statements are not lies at all.

According to this account, one cannot lie to a “third party” eavesdropper “to whom the conversation is not addressed,” because there is no infringement of a right here, because they are not being addressed. One cannot lie to “infants and insane persons,” because they lack the liberty of judgment and hence lack the right to be truthfully addressed. One cannot lie to someone who has given “express consent” to be told untruths, because he has given up the right to be truthfully addressed. One cannot lie to someone who by “tacit consent” or “consent assumed on reasonable grounds” has given up the right to be truthfully addressed because “of some advantage that will follow” by being untruthfully addressed. One cannot lie to someone when the person’s right to be truthfully addressed is inferior to the superior

right that one has to address him untruthfully, such as the right that legitimate leaders and governments and deities have to untruthfully address those over whom they have authority for their “own good or for the public good.”

Finally, in cases where “the life of an innocent person, or something else of equal importance,” cannot be saved except by means of an untruthful address, or “another person can in no other way be diverted from the accomplishment of a wicked crime,” except by means of an untruthful address, Grotius says, “It is perhaps permissible to say what is false.” This is because the evildoer has forfeited the right not to be untruthfully addressed, and/or someone does not have a right to be addressed untruthfully as against the right of an innocent person not to be killed. Finally, it seems that one cannot lie (or it is morally permissible to lie) to “a public enemy.”

Grotius’s answer to the question of whether it is morally permissible to use a ruse in war, then, is that it is. However, it seems that such a ruse is never, strictly speaking, a lie. Hence, Grotius can still be said to hold that lying, in the strict sense, is always morally impermissible.

Grotius notes that Plato argues in the *Republic* that “falsehood is not becoming to a deity.” The idea that God never lies dates at least to Xenophanes, who criticized Homer and Hesiod for falsely depicting the gods as engaged in deception.

### René Descartes

In his *Meditations on First Philosophy* (1641), René Descartes (1596–1650) makes the wrongness of deception the lynchpin of the work. He argues that if there is no God, and Descartes is a product of chance, then he may be mistaken in his reasoning. If there is a God, and if that God is a deceiver, then again Descartes may be mistaken in his reasoning. Only if there is a God who is not a deceiver can Descartes avoid being mistaken in his reasoning. God, however, cannot be a deceiver, because deception is always an imperfection.

Descartes advances the argument that deception is an imperfection in *Meditation* III:

By “God” I mean the very being the idea of whom is within me, that is, the possessor of all the perfections which I cannot grasp, but can

somehow reach in my thought, who is subject to no defects whatsoever. It is clear enough from this that he cannot be a deceiver, for it is manifest by the light of nature that all fraud and deception depend on some defect.

Since “God” is the name of a being that has all perfections and no imperfections, and since deception is an imperfection, “God” cannot be the name of a being that deceives. That is, even if there were to exist nothing that corresponds to God (even if there were no God), God, that is, an all-perfect being, could not be a deceiver, since deception is an imperfection.

In *Meditation* IV, Descartes expands on the claim that deception is an imperfection:

It is impossible that God should ever deceive me. For in every case of trickery or deception some imperfection is to be found; and although the ability to deceive appears to be an indication of cleverness or power, the will to deceive is undoubtedly evidence of malice or weakness, and so cannot apply to God.

Descartes’s argument is that it is an imperfection in anyone to deceive, because deception is an imperfection in itself. Deception is an imperfection in itself because the will to deceive is malicious, and/or indicates weakness.

Descartes’s claim about deception was subjected to criticism. Marin Mersenne (1588–1648), in the second set of *Objections* to the *Meditations*, argued that paternalistic lies are beneficent lies, and are not malicious: “Cannot God treat men as a doctor treats the sick, or a father his children? In both cases there is frequent deception though it is always employed beneficially and with wisdom.”

In the fifth set of *Objections*, Thomas Hobbes (1588–1679) also argued that paternalistic lies are not harmful, indeed are beneficial, and so are not wrong:

The standard view is that doctors are not at fault if they deceive their patients for their health’s sake, and that fathers are not at fault if they deceive their children for their own good. For the crime of deception consists not in the falsity of what is said but in the harm done by the deceiver. M. Descartes should thus consider

the proposition “God can in no case deceive us” and see whether it is universally true.

Descartes responded to Mersenne by saying that deception is necessarily malicious, although there may be cases of “verbal expression of lies” that are not deceptive:

. . . in saying that God does not lie, and is not a deceiver, I think I am in agreement with all metaphysicians and theologians past and future. It is very clear from this that my remarks in the *Meditations* were concerned not with the verbal expression of lies, but only with malice in the formal sense, the internal malice which is involved in deception.

He also implies that the lies told by doctors, like the lies told by prophets in the Bible, are “free of malicious intent to deceive”: “I would not want to criticize those who allow that through the mouths of the prophets God can produce verbal untruths which, like the lies of the doctors who deceive their patients in order to cure them, are free of malicious intent to deceive.” However, this reply is ambiguous because of the claim that the lies of doctors are nondeceptive, which would be rejected by Mersenne and Hobbes, and the claim that the lies of doctors are deceptive and nonmalicious, which would seem to contradict his earlier claims.

Descartes’s final response to Hobbes seems to be that the intention to deceive is necessarily malicious: “All that I require is that we are not deceived in cases where our going wrong would suggest an intention to deceive on the part of God; for it is self-contradictory that God should have such an intention.”

### Baruch Spinoza

In Part IV, Proposition 72, of *The Ethics* (1677), which is devoted to freeing oneself from “the affects,” that is, the emotions, Baruch Spinoza (1632–77) says: “A free man always acts honestly, not deceptively.” That is, someone who is free of all affects and who only acts according to the dictates of reason never acts deceptively. By “acts deceptively” Spinoza appears to have in mind at least lying and making lying promises, since he says that “men . . . agree only in words,

and be contrary to one another in fact.” Because to act according to reason is to act virtuously, it follows that it is never virtuous to deceive or lie. Deception or lying is always vicious.

In the scholium to this proposition Spinoza considers the question, “What if a man could save himself from the present danger of death by treachery?” Spinoza’s response is that reason would never “recommend, without qualification” that someone be deceptive or lie.

There is controversy over what Spinoza is saying in Proposition 72. It may be that he is merely describing a free, rational, virtuous person, an ideal that is difficult or even impossible to attain, and saying that such a person never deceives or lies. Alternatively, it may be that Spinoza is recommending to all persons, even those who are not free, rational persons, that they should never deceive or lie. If the latter is true, then the question is whether Spinoza holds that it may be in a nonfree person’s self-interest on occasion to deceive, or whether he holds that, even in the case of a nonfree person, it is never in a person’s self-interest to deceive.

## History of Deception: 1700 to 1800

Fraud, corruption, and criminal behavior were rampant throughout society in the 18th century, an era characterized by upper-class material wealth and conspicuous consumption, little organized law enforcement or governmental regulation, and ambivalent attitudes toward lying and deception. Common types of lying and deception included fraudulent financial schemes, political corruption, and medical quackery. Common deceptive figures included confidence men, speculators, demagogues, gamblers, cardsharps, patent medicine salesmen, and forgers and counterfeiters. Newly developing forms of popular media such as pamphlets, newspapers, and novels were filled with both true and fictional stories involving lying and deception.

### Political and Economic Fraud

Financial speculation was popular as a path to quick fortune that often involved both business and government officials. The joint stock company emerged in the 18th century as a popular new method of speculation. While some of these companies were legitimately run investment opportunities, others employed deception to attract investors and heighten profits. The resulting speculative bubbles ruined fortunes and reputations, harmed the economy, and led

to government regulation, such as Britain's 1720 parliamentary act requiring all joint stock companies to incorporate. Other popular methods of financial speculation often employing deceptive tactics included the real estate market.

One of the most notorious 18th-century speculative disasters was the South Seas Bubble involving the South Sea Company, a British joint stock company formed in 1711. The company was able to successfully compete against the rival Bank of England for British parliamentary approval to assume ever-greater portions of the national debt through the exchange of government bonds for company stock. The company also received government promises for a British trade monopoly with its South American and South Seas islands possessions, expected to rise in value with anticipated Spanish trade concessions following the War of Spanish Succession. When these concessions did not materialize, the company made false claims of large profits.

The resulting speculative frenzy of 1720 would see company share prices rise from 128 pounds to 1,050 pounds. The bubble collapsed by the end of the year, however, resulting in a massive sell-off and bank failures. Investigations into the company's practices resulted in the prosecution of both company and government officials for deception and corruption.

A second notorious speculative venture of the period was the so-called Mississippi Bubble that further hurt an already weak French economy in the early 18th century. John Law, a Scottish emigrant who served as a financial advisor to the French regent, the Duke of Orleans, used his royal connections to launch his business plans. Law founded both the Bank Generale (renamed the Bank Royale) and the Compagnie d'Occident (renamed Compagnie des Indes), the latter commonly known throughout France as the Mississippi Company. Law attracted investors through promises of trade with North American colonies, such as Louisiana, whose unknown nature led to rumors of bullion trade.

The Mississippi Company first received exclusive control of trade between France and its North American colonies, which was later extended to include control of all trade between France and the non-European world. The company also helped settle the Louisiana colony, minted French

coins, and collected French national taxes. Stock shares, sold for cash and bonds, financed company ventures. In 1720, Law sought to halt declining share sales by deeming his bank's paper notes to be legal tender. His actions instead resulted in rising inflation and the collapse of the Mississippi Bubble. Scholars still debate the honesty of Law's motives.

A third well-known scheme of the period, the Diamond Necklace Affair that scandalized France in the years prior to the French Revolution, also combined economics and politics. The Comtesse de la Motte (née Jeane de Valois de St. Remy) used an illegitimate title and loose connection with the court of King Louis XVI to enhance her impoverished existence. She earned lasting notoriety through her scheme to fraudulently obtain a diamond necklace that had originally been produced for King Louis XV but never sold.

The comtesse hired a prostitute to pose as Queen Marie Antoinette in order to convince the royally disfavored Cardinal Prince Louis de Rohan of the queen's secret interest in the necklace. The necklace then passed from the jewelers to Rohan to the Comtesse de la Motte, with the belief it would be delivered to the queen. The Mottes, however, sold the diamonds in London and kept the profits for themselves. Although the queen had no knowledge of the scam, the public trial and its aftermath added to the public's negative image of her character.

### Science and Medicine

Eighteenth-century science and medicine were also rife with activities of questionable honesty. Lack of medical knowledge regarding diseases and the growth of advertising helped fuel the rise of medical quackery and the sale of medicines and devices with questionable medical claims. The sale of patent medicines by both small family and larger business enterprises began to rise in popularity in the 18th century. Patent medicines, such as Daffy's Elixir, first gained popularity in Britain, later arriving in Britain's North American colonies and other parts of the British Empire. Other European countries soon began producing their own patent medicines.

Patent medicines included a variety of ingredients and drug compounds, relying on the liberal use of alcohol, cocaine, morphine, or opium to

produce the desired effect. The exact combinations of ingredients, and in many cases the ingredients themselves, were closely guarded secrets, which was possible in the absence of government regulatory oversight or labeling requirements. Advertising made broad claims of the medicines' effectiveness to cure a wide variety of medical complaints for both sexes and all ages, ranging from indigestion, colic, and monthly "female complaints" to venereal diseases and cancer. Other commonly promoted uses included cures for baldness and sexual difficulties.

Signature bottles, colorful names and labels, and bold advertisements in newspapers attracted public attention. Patent medicine salesmen traveled their sales territory peddling their products with high-pressured sales tactics and questionable medical claims. Other consumers purchased the medicines from local merchants. Patent medicines, questioned at the time by some doctors concerned with their grandiose claims and likelihood of causing dependency, later became infamous for their fraudulent medical claims and sometimes harmful or fatal effects. The popularity of patent medicines and questionable medical devices would reach its zenith in the 19th century before increasing safety concerns, growing negative publicity, and stricter governmental regulations greatly slowed their sale.

Although beliefs in magic and the practice of alchemy were less prevalent by the 18th century because of the rise of the Enlightenment Age of Reason, practitioners still found benefactors and followers. Alchemists claimed the ability to transmute lesser metals into gold and silver. One such legendary 18th-century alchemist was Lascaris, reputed to have traveled throughout Germany giving various individuals he befriended alchemical powders with the power of transmutation. He never shared the secret behind the powder, and followers often ran into difficulties after running out of their supply. One follower was reputed to have been hanged as a fraud.

One of the most prominent figures in this field was Count Alessandro Cagliostro, who traveled throughout Europe with residences in London, St. Petersburg, Paris, and Rome, among other notable cities. He claimed extensive Middle Eastern and African travels, using the knowledge he gained to introduce the Egyptian Rite

into Freemasonry after joining the secret society in 1777. He attracted wealthy and aristocratic patrons and followers alike through demonstrations of healing and alchemical abilities as well as séances. Some celebrated his supernatural and healing abilities, while others denounced him as a fraud that bilked patrons and left a trail of financial debt in his wake. He was even falsely implicated in the Diamond Necklace Affair.

### Popular Culture, Entertainment, and the Arts

Popular cultural figures whose trade relied on deception included card and shell game masters, magicians, jugglers, and ventriloquists. Optical illusions were widely popular among both the general public and the scientific and philosophical communities. Popular devices for creating such illusions included magic lanterns, the camera obscura, and the zograscope. Early magic lanterns used fire to project images onto screens and are considered early forerunners of the slide projector. The camera obscura projected external images of the natural world into the camera, where they were placed on public view

or sketched by artists such as Jan Vermeer. The zograscope, also known as an optical diagonal machine or perspective glass, allowed the public to view color prints from a deceptively three-dimensional perspective.

The Mechanical Turk, a purported automaton that proved highly skilled at playing chess against human opponents, was a widely popular diversion before its exposure as a fraud. Viennese inventor and demonstrator Wolfgang von Kempelen and later demonstrator Johann Maelzel successfully toured the machine throughout Europe and North America. The use of a mechanical torso featuring a large mustache and Oriental attire, as well as numerous mechanical parts, added to the machine's exotic appeal, but a hidden compartment secreting a human operator allowed the hoax to work.

Artistic fakes and forgeries created numerous 18th-century scandals. One of the more infamous creators of fake Shakespearean works was the British teenager William Henry Ireland, who claimed to have found numerous lost works. His fraudulent play *Vortigern and Rowena* was even staged in London before controversy over the

Patent medicine bottles from the 1700s (from left, Dalby's Carminative, Daffy's Elixir, and Turlington's Balsam of Life) were adopted by many early quack and patent-medicine proprietors in Britain, who are depicted in Franz Anton Maulbertsch's *Der Quacksalber* ("The Quack"), circa 1785 (right). Dalby's Carminative (late 1770s) claimed to aid infants suffering from "wind" and "watery gripes." Daffy's Elixir (18th century) was originally designed for diseases of the stomach but was later marketed as a universal cure. Turlington's Balsam of Life (1744) was supposed to cure "the stone gravel, cholick, vomiting and spitting of blood, and other weaknesses and decays."

authenticity of his claims led to his exposure as a fraud. Other noted literary frauds of the era included James Macpherson and Tom Chatterton.

Many 18th-century audiences, scholars, and critics claimed that all fictional works were in fact fraudulent deceptions, while others argued that works clearly understood as fiction were not to be regarded as fraud. Even more questionable were those fictional works presented and advertised as true stories or popular nonfiction forms, such as travel narratives that routinely employed exaggerated descriptions of exotic lands and peoples, and memoirs filled with exaggerated tales of love conquests or other feats.

Eighteenth-century literature, both fiction and nonfiction, was replete with characters and themes centered on dishonesty, such as criminal biographies and fictional thieves and swindlers. One such legendary character was the rake, a term used to describe both historical personages and fictional characters. Rakes were known for their immoral conduct, often associated with wasted inheritances, lavish lifestyles, and the seduction, abandonment, and ruin of vulnerable young women. Rakes, formerly viewed as dashing figures, had acquired a more negative view reflecting the ambivalence surrounding their immorality. The central figure in William Hogarth's paintings *A Rake's Progress* is thus fated to insanity in Bedlam.

One of the most historically renowned 18th-century rakes and con artists was the Italian Giovanni Giacomo Casanova, whose name later became a synonym for a handsome, promiscuous but gallant playboy. Casanova was known for his good looks, intelligence, and charming manner. Casanova used these attributes to cultivate wealthy and influential supporters and to perpetrate various fraudulent schemes upon them. Casanova gained historical notoriety for his infamous memoir describing his many sexual pursuits as well as the 18th-century society in which he lived. His exploits had such a mythological aura that many began to view him as a larger-than-life fictional character.

### Attitudes Toward Lying and Deception

Religious, political, legal, philosophical, and cultural beliefs emphasized the importance of truth and the need to punish or eradicate various types

of lying and deception. The 18th-century proliferation of con artists, illusionists, and magicians was counterbalanced by the rise of philosophers and scientists seeking to expose their public deceptions. Meanwhile, the rise of science and reason centered in the Enlightenment challenged earlier beliefs in magic and alchemy.

Lying and deception in its various forms was seen as a threat to the maintenance of social order. Many religions, such as the Judeo-Christian religions, held truth to be a godly attribute, while lying and deception were commonly viewed as sins and a rejection of God. The cultural fascination with the various forms and figures of deception also challenged Enlightenment beliefs centered on the sensory acquisition of knowledge by showing that the senses could be both unintentionally and intentionally deceived.

Scholars and scientists also began paying closer attention to the physiological responses that accompany the act of deception, giving rise to early advances in the fields of criminal apprehension and lie detection. Some scientists observed how the stress brought on in some people by the practice of deception resulted in increased heart rate, rising blood pressure, and perspiration that would give away the deceiver. The public also became more cynical with regard to dishonest motivations.

The widespread acceptance and commonplace nature of lying was countered by views on the immorality of lying. Criminals employing deceptive practices faced harsh penalties. Businessmen and government officials implicated in fraudulent schemes faced public ridicule, ruined reputations, ended careers, and economic devastation. The questionable line between honest but misguided businessmen and dishonest con artists and swindlers or between the charming Casanova and the dissolute rake were exemplary of the century's ultimately ambivalent attitudes toward dishonesty.

## History of Deception: 1800 to 1900

Discussion of lies and deception in the 19th century was dominated by the question of whether they were morally wrong because of their bad consequences, as argued by the utilitarians, or because they violate a universal standard of what is right, as argued by nonutilitarians. No one defended an absolute prohibition on lying and deception, however.

In his *An Introduction to the Principles of Morals and Legislation* (1780; 1789; 1823), Jeremy Bentham (1748–1832) defended the principle of utility—“that principle which approves or disapproves of every action whatsoever, according to the tendency which it appears to have to augment or diminish the happiness of the party whose interest is in question”—as the basis for all law and ethics.

An action, such as telling the truth, is right if it conforms to the principle of utility, that is, if it has the tendency to increase the happiness of the community by a greater amount than any other action. An action, such as a lie, is wrong if it fails to conform to the principle of utility, that is, if it has the tendency to decrease the happiness of the community. Laws exist to prohibit types of actions that are wrong according to this principle. A violation or breach of a law is an offense.

In the section on the division of offenses, Bentham discusses different “offences by falsehood.”

He divides such offenses into four kinds: “1. Simple falsehoods. 2. Forgery. 3. Personation. 4. Perjury.” As an example of Personation he gives libel, (this is the written form of defamation; slander is the spoken form). What is common to all offenses by falsehood is that they cause, or at least attempt to cause, a false belief in another person, “whether by discourse or otherwise.”

When a falsehood is not accompanied by “certain special circumstances,” such as the “form in which the falsehood is uttered,” or the “circumstance of its relating or not relating to the identity of the person of him who utters it,” or the “solemnity of the occasion on which it is uttered,” then it “may be styled a simple falsehood.” It is here that Bentham makes his most famous claim about falsehoods:

Falsehood, taken by itself, consider it not as being accompanied by any other material circumstances, nor therefore productive of any other material effects, can never, upon the principle of utility, constitute any offense at all. Combined with other circumstances, there is scarce any sort of pernicious effect which it may not be instrumental in producing.

Bentham’s claim here is that a simple falsehood, or a simple lie, or more generally a simple act of (intending) deception, by itself, does not by its very nature constitute “an offence,” that is, crime. More generally, it is only when a lie or an act of deception produces effects that decrease happiness that it becomes an “offence.” Hence, a lie or an act of deception is only instrumentally wrong.

Bentham seems to expand “falsehood” to include any act of intending to deceive. In her *Illustrations of Lying in All Its Branches* (1825), Amelia Opie (1769–1853) defines a lie as “the intention to deceive” and argues that there can be “passive as well as active lying.” By passive lying she at least means withholding the truth, or not telling the whole truth, with an intention to deceive. By active lying she means telling a falsehood with the intention to deceive.

The utilitarian William Paley (1743–1805), in *The Principles of Moral and Political Philosophy* (1785), gives the example of a man who writes a book titled *A History of England*, but who “in his account of the reign of Charles the First, should

willfully suppress any evidence of that prince's despotick measures and designs." Such a historian, he says, "might be said to lie," in the sense of "lies of omission." Clearly, passive lying would extend to cover such a lie of omission. What is not clear is whether Opie's passive lying would extend to cover another case of a lie (to "act a lie") given by Paley: "when a tradesman shuts up his windows, to induce his creditors to believe that he is abroad." If this is also passive lying, then there is no difference between lying and intending to deceive.

### Antiutilitarian Argument: William Whewell

Bentham distinguishes between falsehoods and "offences against trust," and does not make mention of promises in his discussion of falsehoods, unlike Paley who held that "A lie is a breach of promise." The antiutilitarian William Whewell (1794–1866) discusses lies after discussing contracts in his *The Elements of Morality, Including Polity* (1845). Here he says, "Lies stand nearly on the same footing as promises; for a Lie is a violation of the general understanding among mankind, which the use of language implies." Whewell uses this point to limit what can count as a lie. Assertions "not literally true, may, by general Convention, cease to be lies." For example, "when I wish not to be interrupted by visitors, I write upon my door, Not at home, and if there be a common understanding to that effect; this is no more a lie than if I were to write, Not to be seen." Whewell rejects the extension of such a convention to lawyers advocating for their clients in court, however.

Whewell does not accept as an excuse for telling a lie in response to a question, when the questioner has no right to know the truth, that a secret must be kept. He insists that "the Questioner has a right not to be told a lie, for all men have such a Right." His claim that "all men have such a Right" not to be lied to might imply that an individual may not lie to murderers in order to save innocent lives. However, he does allow for so-called lies of necessity. These include lies told "for the purpose of saving one's life; or to avoid some other extreme peril" to oneself, which are "at least excusable, and allowable." Excusable and allowable self-defensive lies, however, are not admirable: "In such Cases of Necessity, we may excuse the act, but we cannot admire it."

Protective lies, "told for the sake of saving a friend from some great misfortune," receive even greater approval. Whewell goes further, and says that some lies, heroic lies, or lies told to save a friend that bring "some great foreseen calamity to the teller," are such that they "excite a still higher admiration." Here he instances "when Lucilius offers himself to the soldiers of Octavius to be killed, declaring himself to be Brutus."

Whewell does hold that "the Duty of Truth may be violated by silence," such as "selling defective wares, without notice of their faults," because of "the general understanding existing among Buyers and Sellers." He also considers a case from Cicero of a corn merchant who arrives in Rhodes, knowing that other ships laden with corn will arrive the next day. "If the merchant in question ask such an exorbitant price for his corn, as to imply that no further supply is probable, he falls under blame. On the other hand, he is not bound to sell his corn to-day for the price to which it may fall tomorrow, when the other vessels arrive."

### John Stuart Mill

In *On Liberty* (1859), the utilitarian John Stuart Mill (1806–73) included "falsehood or duplicity" as one of the "acts injurious to others," saying that they were "fit objects of moral reprobation, and in grave cases, of moral retribution and punishment." Lies, that is, are harmful and are properly subject to moral criticism, and, in the most severe cases, can be punished by law. Not only lies themselves, "but the dispositions which lead to them," namely, "dissimulation and insincerity," are "properly immoral, and fit subjects of disapprobation which may rise to abhorrence." Such dispositions to lie are "vices" and "constitute a bad and odious moral character."

In *Utilitarianism* (1861; 1863) Mill defends utilitarianism from the misapprehension that it is a philosophy of mere expediency "for the particular interest of the agent himself." Mill argues that utilitarianism is not concerned with the interest of any particular agent but with the good of mankind. As an example, Mill instances telling a lie; such an act may be in the self-interest of the agent, but it is contrary to the good of mankind because it weakens the trustworthiness of human assertion that is essential to social well-being and necessary for human happiness.

Mill held in *On Nature* (1874) that “savages are always liars,” and that he believed that habitual lying is “the natural state of those who were both uneducated and subjected.” However, it is possible to read such statements in the light of the utilitarian and evolutionary ethicist Herbert Spencer’s discussion of Veracity in his *The Principles of Ethics* (1892). After quoting from many authors complaining of the habitual lying of certain tribes, and contrasting it with reports about the commitment to truthfulness of other tribes who are both peaceful and bellicose, Spencer argues that what is common to all the tribes who are truthful is that “they are not subject to coercive rule.” Spencer’s conclusion is that “it is the presence or absence of despotic rule which leads to prevalent falsehood or prevalent truth.” Given that Mill talks about the habitual lying of those who are “subjected,” what he says may be consistent with Spencer’s conclusion. Mill does not argue that lies may never be told. The rule not to tell lies does have exceptions, such as protective lies to malefactors and paternalistic lies to those who are dangerously ill. Here Mill argues that the principle of utility, which he envisages as a second-order rule of morality, invoked only to decide between different possible first-order rules of morality, should be used to determine what the moral rule about lying should be:

But in order that the exception may not extend itself beyond the need, and may have the least possible effect in weakening reliance on veracity, it ought to be recognized, and, if possible, its limits defined; and if the principle of utility is good for anything, it must be good for weighing these conflicting utilities against one another, and marking out the region within which one or the other preponderates.

### Leslie Stephen

Leslie Stephen (1832–1904), in *The Science of Ethics* (1882), a work of evolutionary ethics, argues that although “The rule of truthfulness . . . seems to possess the *a priori* quality of a mathematical axiom,” and although it seems that “Be truthful” means, “Speak the truth whatever the consequences, whether the teller or the hearer receives benefit or injury,” this is not how the rule of truthfulness is actually applied. As applied, there are the usual exceptions made to the rule.

However, Stephen argues that it is possible to distinguish between the external form of the rule of truthfulness, “Lie not,” and the internal form of the rule, “Be trustworthy.” In the exceptional cases, such as lying to malefactors or invalids or to those demanding information to which they have no right, the person actually maintains the trust that not lying normally preserves: “Truthfulness is the rule because in the vast majority of cases we trust a man insofar as he speaks the truth; in the exceptional cases, the mutual confidence would be violated when the truth, not the lie, is spoken.”

In such exceptional cases, Stephen maintains, it is a moral duty to lie:

If I were absolutely certain that a lie would do good, I should certainly hesitate before speaking the truth, and the certainty might be of such a kind as to make me think it a duty to lie. It has been said by moralists that the good man would not commit the most venial sin, even though the consequences of his virtuous action were the perishing of all mankind in torture. The statement is either shocking or meaningless. I can conceive of no action which would not be an abominable crime by the simple fact of its entailing such consequences, and of no crime which would not become an imperative duty if it evaded them.

### Henry Sidgwick

In the third edition of *The Methods of Ethics* (1884; first published in 1874), the utilitarian Henry Sidgwick (1838–1900) takes issue with Stephen’s claim that the true exceptionless rule is “Be trustworthy.” A liar does not manifest trustworthiness to his victim when he lies, even if his lie is justified:

Even when the falsehood is in legitimate defence of others against attacks, we cannot say that the speaker manifests “trustworthiness” without qualification; for the deceived assailant trusts his veracity, otherwise he would not be deceived.

In his chapter on Veracity, Sidgwick argues that the utilitarian defense of lying in exceptional circumstances when it will produce a greater amount of utility does not necessarily conflict with the position of common sense morality. Common

Utilitarian John Stuart Mill, in his 1859 treatise *On Liberty*, included "falsehood or duplicity" as one of the "acts injurious to others," saying that they were "fit objects of moral reprobation, and in grave cases, of moral retribution and punishment."

sense morality "does not seem to prohibit . . . decisively" lying if "lying will defend us better against a palpable invasion of our rights." Furthermore, common sense morality seems to permit paternalistic lies told to invalids and to children. It even appears to permit lawyers to lie on behalf of their clients. It seems that common sense morality does, ultimately, appeal to consequences:

But if the lawfulness of benevolent deception in any case be admitted, I do not see how we can decide when and by how far it is admissible, except by considerations of expediency; that is, by weighing the gain of any particular deception against the imperilment of mutual confidence involved in all violation of truth.

Sidgwick does entertain the objection that "if it were generally understood that lies were justifiable under certain circumstances, it would immediately become quite useless to tell the lies, because no

one would believe them." He has three replies to this. First, a complete breakdown in trust, under certain limited circumstances, "is not necessarily an evil," because it would mean that "falsehoods would no longer be told" in such circumstances. Second, knowledge that lies are justified in certain circumstances does not necessarily mean that lies are not believed in such circumstances (Sidgwick instances lawyers lying about the innocence of their clients). Finally, if it is among the circumstances that a person is in that (1) it is not generally accepted that a lie is justified in these circumstances, and (2) this lie will not tend to make it more generally accepted that a lie is justified in these circumstances, then, in these circumstances, the lie can succeed. Hence, it can be justified.

It may be argued that Sidgwick himself holds that "the vulgar" should believe that lies are never justified or are only possibly justified in exceptional circumstances, so that "an enlightened few" utilitarians, who know that lies are justified in many more circumstances, can lie for the greater good in those circumstances. As Sidgwick says:

. . . it may be desirable that Common Sense should repudiate the doctrines which it is expedient to confine to an enlightened few. And thus a Utilitarian may reasonably desire, on Utilitarian principles, that some of his conclusions should be rejected by mankind generally.

Utilitarianism might justify utilitarians lying to mankind generally that lies are never to be told.

Oscar Wilde (1854–1900) offered a very different defense of lying in his *The Decay of Lying: On Observation* (1889; 1891). There he argues that "the only form of lying that is absolutely beyond reproach is lying for its own sake," and that the highest form of lying for its own sake is art, or "the telling of beautiful untrue things."

in theorizing about language also lead to important distinctions between lying and deceiving, and between lying and making false promises.

### G. E. Moore

In the chapter "Ethics in Relation to Conduct" of *Principia Ethica* (1903), G. E. Moore (1873–1958) advances a consequentialist ethics according to which "I am morally bound to perform this action" is identical with the assertion "This action will produce the greatest possible amount of good in the Universe" (into the "infinite future"). The "good" in question consists of intrinsically valuable states of consciousness, such as "the pleasures of human intercourse and the enjoyment of beautiful objects."

Since people do not know which individual actions in any given circumstances will produce the greatest possible amount of good in the universe over time, "we cannot hope to discover which is the best possible alternative in any given circumstances." The question remains, however, whether individuals can "lay down any general rules to the effect that one among a few alternative actions will generally produce a greater total of good in the immediate future." Although "We can secure no title to assert that obedience to such commands as 'Thou shalt not lie,' or even 'Thou shalt do no murder,' is universally better than the alternatives of lying and murder," individuals can say that these rules are generally better than the alternative rules. For example, not lying will generally produce a greater total of good in the immediate future than lying.

This amounts to a defense of the moral rules of common sense, including, it seems, the rule "thou shalt not lie." Moore accepts that "in some cases the neglect of an established rule will probably be the best course of action possible." Nevertheless, an individual is never justified in breaking an established rule of common sense morality, because he or she is never justified in believing that this is one of these cases in which breaking the rule is the best course of action. "In short, though we may be sure that there are cases where the rule should be broken, we can never know which those cases are, and ought, therefore, never to break it." If the rule of common sense about lying is "Thou shalt not lie," then this implies that the rule is never

---

## History of Deception: 1900 to 1950

Discussion of lying and deception in the first half of the 20th century is dominated by the question of whether there is an exceptionless moral rule to not lie, or whether lying is ever morally permissible, or even morally obligatory. Developments

to be broken, and a lie is never to be told. This argument appears to assume, however, that the rules of common sense morality in general are exceptionless rules like “Thou shalt not lie,” as opposed to rules with built-in exceptions, such as “Do not lie, except.”

### Hastings Rashdall

Hastings Rashdall (1858–1924), in the chapter of *The Theory of Good and Evil* (1907) titled “Ideal Utilitarianism,” advances a subjective version of the nonhedonistic consequentialist criterion for a right action: “The right action is always that which (so far as the agent has the means of knowing) will produce the greatest amount of good upon the whole.” This “good” is such that it “includes, but is not limited to, pleasure,” and the criterion implies that “all goods or elements of the good are in some sense and for some purposes commensurable.”
